

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

- + *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
- + *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
- + *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
- + *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Institution of Municipal and County Engineers : Dinner at the Hotel Metropole.
<i>Friday, July 12.</i>
Institute of Sanitary Engineers : Visit to Birmingham (three days).

FAIR WAGES.

THE London County Council, following the lead of the House of Commons, having adopted the principle of fair wages in making contracts, finds that it is not easy to prevent unscrupulous employers from evading the conditions and so undercutting in price of their tenders those firms who do pay fair wages. Accordingly, the Council on February 22, 1910, passed a resolution as follows : " That it be referred to the General Purposes Committee to report whether all persons or firms submitting tenders to the Council should not be required to make a ' fair-house ' declaration as to the workpeople being employed at trade union rates of wages for such working hours and under such conditions of employment as are in conformity with the recognised customs of the various trades, together with a penalty clause in the event of the non-compliance with the terms of the declaration."

We are not immediately concerned to discuss the wisdom of the fair wages policy nor the statesmanship of adopting trade union rates as fair wages, but it is obvious from the elaborate precautions that the London County Council seem to think necessary to enforce that policy that they, as the representatives of the ratepayers of London, are prepared to pay a higher price for work than they need do, or, in other words, that there are employers eager to make contracts at a price only possible by the readiness of workpeople to accept employment at less than trade union rates of wages. The London County Council has an army of officials to carry out such a rigorous system of inspection as shall ensure that their contractors shall supply the agreed quality of work and material, so that it cannot be said that the ratepayers would suffer by the Council's contracts being made at the lowest possible price. It follows, therefore, that the general body of ratepayers are to pay more than they need do for the benefit of a privileged class—those who receive trade union rates of wages. There could scarcely be a better proof that the trade union rates of wages are

not fair to the general community than the necessity the Council finds for its elaborate precautions for maintaining its fair wages policy. The bitter irony of the Council's fair wages policy is that the general body of workpeople pays for the privileges of the select few workpeople who are employed under the Council's contracts, and the more so as the greater part of the Council's activities is directed to services for the amenity of workpeople. If the Council pays higher prices than necessary under its contracts the tramways it maintains for workpeople cost more, and the houses it builds for workpeople cost more, and the workpeople pay more.

In compliance with the Council's reference quoted above, the General Purposes Committee has presented a lengthy report, which commences : " The solicitor has informed us that there would be no difficulty in inserting a declaration to the desired effect in the forms of tender, but has pointed out that a declaration would apply only to the time at which it was made and would not bind the tenderers as regards the future. The solicitor suggested that this difficulty might be overcome by inserting, in lieu of the declaration, an express undertaking to the effect that the contractor, in addition to carrying out the Council's usual provisions as to rates of wages and hours of labour as regards all men employed on the work the subject of the contract, should, as regards all other workpeople in his employ during the execution of the contract, comply with the stipulations mentioned in the above resolution. The solicitor, however, expressed the opinion that even if such an undertaking were inserted in contracts it would not be practicable to provide for damages in case of breach thereof, as it could hardly be contended that the Council had suffered damage, but that provision might be made for the Council to have power to terminate the contract in such event and to place the defaulting contractor on the list of persons and firms from whom the Council will not receive tenders."

The report of the General Purposes Committee dis-

FROM A SKETCH BY MR. JOHN MACGREGOR, PUGIN STUDENT, 1912.

cusses the practice of the Government departments and their methods of enforcing the observance of the fair wages clauses as well as certain recommendations of the Council's Store and Contracts Committee, which were intended to substitute for the policy that all tenders for stores should be open to public competition a system of lists of approved firms. These recommendations were, however, referred back by the Council on February 6, 1912, but are to be brought forward again in a revised form though to the same effect.

These recommendations are backed by the General Purposes Committee, who say "we can conceive no better way by which the Council can press to a conclusion its evident determination to exclude unfair employers of labour from sharing in its contracts." All the objectionable features of a list of favoured contractors are to be permitted a chance of developing because the maintenance of the fair wages policy is found impossible if contracts for public work are to be open to public competition. Certain limited bodies of workpeople and a

certain limited number of employers are to be favoured to the exclusion of other workpeople and other employers in the same avocations and business. And the general community is to pay for the exclusive privileges granted to the favoured few. This is the outcome of the fair wages policy as conducted by the London County Council.

There is apparently an attempt to provide a professed compliance with the principle of open competition by a proposed standing order that, except where otherwise provided, all tenders shall be invited by advertisement. But the method of advertisement as recommended by the Stores and Contracts Committee is: "That advertisements be inserted twice a year in the principal trade and daily papers, and also each week in the *London County Council Gazette*, inviting applications to tender for the supply of stores and for general maintenance contracts arranged by the Stores and Contracts Committee (except printing, bookbinding, coal, and coke, and such other contracts as the Council may from time to time deter-

FROM A DRAWING BY MR. JOSEPH HILL, SUBMITTED FOR PUGIN STUDENTSHIP, 1912.

mine); that applications be received at any time from firms desirous of tendering and be immediately considered; that, subject to the result of the usual inquiries as to capacity, conditions of labour, &c., being satisfactory, the name of the applicant be at once placed on the appropriate list or lists, which shall also include such other known satisfactory firms as the Committee may consider desirable; and that forms of tender be sent, as issued, to all firms on the list or lists concerned. That, in the event of the number of names on the list in any case being insufficient, the Council do reserve the right to invite tenders by issuing a further advertisement."

Thus will be ensured a list of favoured contractors, and a "black list" of other contractors is provided for by the following proposed standing orders: "(ii) No contract shall be entered into with any person or firm who has been proved, when executing a contract for the Council,

to have infringed the conditions as to fair wages imposed in such contract. (iii) There shall be inserted in the instructions for tender issued in respect of every contract a clause to the effect that no tender will be considered from any person or firm who has been proved, when executing a contract for the Council, to have infringed the conditions as to fair wages imposed in such contract."

For "works of construction, repair, or maintenance of buildings, or of engineering works, whether civil, mechanical, or electrical," a list of rates of wages and hours of labour is prepared by the Council, which must be observed by all contractors, who, in the event of a breach of the contract conditions enforcing such rates of wages, are to "pay to the Council as liquidated damages, and not as a penalty, the sum of £5." For the employment of a workman beyond the stipulated number of hours the contractor is to be mulcted in the payment

of "five shillings per hour for every hour during which, on each day, each such workman shall be employed by the contractor beyond the maximum number of hours prescribed." No matter if an urgent necessity arises for continued work to avoid a catastrophe, the workman must down tools when his time is up. Sub-letting is also prohibited, except by permission and under rigid conditions, and for a breach in this case the "liquidated damages" is a sum of £200.

NOTES AND COMMENTS.

An important Memorandum upon the Structural Requirements of the Factory and Workshop Acts has just been issued by the Home Office, which epitomises the regulations and makes recommendations in certain cases to which the Factory Acts do not apply in respect of: (1) Means of escape from fire; (2) sanitary accommodation; (3) lavatories; (4) meal-rooms; (5) general ventilation; (6) air space; (7) floor space; (8) lighting; (9) temperature; (10) floors; (11) walls and ceilings; (12) stability of buildings; (13) basements. An appendix gives some additional notes with regard to the structural requirements of the Factory and Workshop Acts, and of the Regulations and Special Rules made under them in the case of certain specified manufactures. A second appendix gives the form of model bye-laws issued by the Local Government Board with respect to the provision of means of escape in case of fire in certain factories and workshops.

A brochure on "Municipal Art Galleries and Art Museums: their scope and value, with special reference to the needs and opportunities of Manchester, and containing plans of the present proposed Manchester Art Galleries," written by Mr. Bernard Douglas Taylor, excellently and critically discusses the part that is and should be played by such institutions, and the position that should be taken by the art galleries of Manchester. Especially good is the author's expression of view on administration, in which he rightly advocates the installation of a responsible expert director, who should be, to a considerable extent, autocratic. Comparison is made between the accommodation possessed by the Birmingham Art Gallery with the cramped and inadequate space occupied at present by that of Manchester, and thus a telling argument is advanced for the early prosecution of the long-delayed scheme for the new galleries at Manchester.

The adoption by the London County Council of the principle that the maximum number of scholars in a class-room should be reduced to forty in senior departments and to forty-eight in infants' departments, necessarily involves a considerable amount of alterations and additions to the existing schools beyond the normal increase of accommodation required to meet the growth of population, and an arrangement has been made between the Accommodation and Attendance Sub-Committee of the Council and the Board of Education for a scheme by which the work entailed shall be spread over fifteen years, during which it is estimated that an expenditure of £5,150,000 will be required in the modernising of old schools and the erection of new ones. The rapid and continual advance of ideas amongst educationists of the essentials of a satisfactory school emphasises the desirability of using in the erection of school buildings less permanent methods of construction than have been customary. It is stupid to build schools that will last a hundred years when they are hopelessly out of date in twenty.

The Institution of Heating and Ventilating Engineers has, on the suggestion of Mr. A. H. Barker, appointed a committee of the Institution to consider the methods at present in vogue of calculating heat losses from buildings,

especially in their relation to the corresponding methods in current use for guaranteeing results. It has also been decided to issue a circular to members of the Institution inviting subscriptions for the establishment of scholarships for research work in the science of heating and ventilating. It is suggested that the number of the scholarships should be two and the value £50 per annum each. A certain amount of research into domestic engineering is being done under the direction of Mr. Barker at University College, London, where there is a small plant. It is desired to extend this work considerably in the national university system. The object of the committee is evidently to enforce the principle laid down by Mr. Barker in his recently published book, that engineering firms who supply heating apparatus should decline to furnish a guarantee of temperature when such guarantee is tantamount to a warranty of the materials and construction of a building, but should substitute a guarantee of the amount of heat which the apparatus would furnish. As we said in our review of the book, someone has got to determine what amount of heat any given building will require to make the man who pays for it comfortable. The soi-disant "heating engineers" who supply boilers, pipes, and radiators evidently funk the job.

The case of Henry Hope & Sons (heating apparatus manufacturers) v. Goode and others, trustees of the Wesleyan Methodist Chapel, Coventry, is one more illustration of the difficulties of sub-contractors. Messrs. Hope put in the heating apparatus and the trustees paid Randall, the builder, for it, and as he did not pay it to Hope & Son they obtained judgment against him, but as he meantime had become bankrupt, judgment was not signed. The respondents then applied to the trustees, who declined to recognise Hope & Sons, and repudiated liability. An action was brought against the trustees in the Birmingham County Court, where the judge said the action could not be maintained, and gave judgment for the defendant trustees. Hope & Sons appealed to the Divisional Court (Justices Darling and Bucknill), who reversed the County Court judgment on the ground that Hope & Sons had never released the trustees from their liability.

The case was taken to the Court of Appeal and tried before Lords Justices Vaughan Williams, Fletcher Moulton and Buckley, and in giving judgment Lord Justice Williams said he had gone carefully through the correspondence and the evidence, and he very reluctantly said that, in his opinion, the court could not interfere with the finding of fact by the County Court Judge. He, personally, was exceedingly sorry for Hope & Sons, because the only inference to be drawn was that they were obliging people who were their customers, and wishing to help them. All they had done was to oblige the trustees to have their account passed through Randall in consequence of the difficulties raised by the appellants. The judgment of the Divisional Court must be reversed, and that of the County Court judge restored, with costs here and below. Lords Justices Moulton and Buckley concurred.

ELECTRIC FANS.

THE simplicity and readiness of application of an electric fan are sufficient reason for its employment as a means of ventilation. We can touch a switch, and at once there is a whirling of fan blades and an active current of air. But the reliability and the efficiency of a fan are the result of an amount of thought, experiment, organisation, industry, vigilance, and attention that can hardly be realised unless we watch the manufacture from start to finish. An opportunity for such an experience was afforded us by a recent visit to the Witton works, near Birmingham, of the General Electric Company, Britain's largest electrical manufacturing concern, which makes everything electric, and for whose activity nothing is too

large and nothing too small. Generators up to 5,000 kilowatts are made at Witton, and also the smallest of fan motors. It has always been a leading policy of the company to extend the use of electricity not only for lighting, but also for the general industrial application of small motors, and particularly for all sorts of domestic purposes; and a new workshop of 54,000 feet area has been recently erected and fitted to accommodate the small motor and fan work.

Here we see first the machinery devoted to press work, by which all classes of sheet metal stampings are produced for the primal basis on which fans and their motors are built up. At the commencement of manufacture we find that all parts are made to standard and accurate gauge. Even the smallest motors are not treated and built as toys, but every part is, in engineering parlance, "machined or drilled to jig." It is then mechanically gauged or electrically tested after each single operation, so that when a group of parts is assembled everything goes together without hand fitting or adjustment. The accuracy and interchangeability thus resulting tends to cheapen manufacture, as well as ensuring that all parts are positively correct, so that a positive and negative fault do not temporarily correct each other to break down later.

The continual and repeated testing is the most striking feature of manufacture at Witton; thus in the making of a single armature the shaft core and commutator are each checked, tested, and assembled; coils are wound on formers and then tested for resistance, taped with silk and placed in position in the armature slots, which are lined with empire cloth and press-palm, then tested for earths, shorts or open circuit, or reversal of connections; then soldered to commutator and tested again; dipped in varnish and stove-dried twice; the commutators turned, tested finally, and then sent to stores as a finished component. As with the armature so with all the other components of a motor and fan, each individual part is tested by itself, and each assembly of parts is also tested and inspected, all work in the shop being done on the piece-work system, and before each operation is paid for the inspector must sign approval on the piece-work ticket. It is one of the paradoxes of such close inspection that the more exacting the scrutiny the fewer faults are to be found, as the workmen know precisely what will pass and work up to it. The result of the whole system is that the company is able with confidence to guarantee all its motors even to the smallest desk fan.

The completed small-power and fan motors are subjected to the following tests: The smallest motors are given a flash test at 500 volts alternating current up to 1,000 volts in the standard larger sizes; the insulation resistance is measured and must exceed 4 megohms; a running test of four hours' duration is made, after which the temperature rise in desk fans must not be more than 60° F., whilst the speed on the running test must be within 5 per cent. of normal. Periodical tests for silent running are also made in an isolated sound-proof house apart from the workshops.

It is stated by the company that great attention has been given to gaining higher efficiency in their fans by exhaustive tests of both fan blades and motors, so as to obtain either a higher air output for the same current consumption or a saving in current for the same air output, and it is claimed that whilst 12-inch desk fans frequently consume 40 watts the company's "Freezor" Liteweight takes only 23 watts, whilst their 16-inch fans take only 45 watts against the 60 watts which are usually required with other makes.

The fans made by the company and marketed under the trade name "Freezor" include desk, trunnion and bracket fans, ceiling fans, punkahs and exhaust fans, and are suitable for either continuous or alternating current of various voltage. Oscillating fans of different types are also made, which are particularly useful for application of the theory of Dr. Leonard Hill, that movement is as important as change of air in its effect on the comfort of the public.

THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS.

THE above Society held its annual meeting on Friday, June 28, at Burlington House, Piccadilly, W. Mr. Thackeray Turner, F.S.A., F.R.I.B.A., Chairman of the Committee, presided. The thirty-fifth annual report includes a list of more than two hundred buildings which have come before the Society in the past year. Particulars are given of the more important cases. From the report we give the following extracts:—

Abingdon Abbey, Berkshire.—The Corporation have thoroughly overhauled and repaired the beautiful thirteenth-century chimney of the Prior's Lodging, under the close personal guidance of a professional member of the Society. This interesting relic of mediæval architecture is now sound and stable. The repair was a somewhat difficult task.

Ashby-de-la-Zouch Church, Leicestershire.—At the request of the church authorities this building was visited by a professional member of this Society. His report, which chiefly concerned the nave roof and the stonework of the tower, has been adopted by the vicar and churchwardens. Towards the end of the last century two aisles were added to the nave, and drastic works of restoration were carried out. Fortunately, the nave roof and the greater part of the tower remain unspoiled. The stonework of the tower, which is of a very beautiful colour, is much perished, and the set-offs of the buttresses are loose. There is also a serious crack in the staircase wall from top to bottom. The decay of the stone is doubtless due to the proximity of the collieries and potteries, and it is this work which calls for immediate attention. The work is to be carried out during the summer of 1912 in accordance with the principles of the Society.

Old Parsonage, Eastbourne, Sussex.—With the consent of the owner, his Grace the Duke of Devonshire, this interesting building was visited by a member of the Society, who reported to the committee. With the exception of the internal arrangements, the building has not been materially altered since it was built in the fifteenth century. The walls are of flint, with stone dressings, and the latter have perished badly. The building measures about 26 feet wide and 76 feet long, and contains a large hall on the ground floor having an open fireplace. The owner has given the building to the Parish Church, and the intention is to adapt it for use as a Parish Hall. The necessary works of repair are likely to be carried out on the lines recommended by the Society.

Cloisters, Eton College, Bucks.—In spite of very general protest from individuals, and from this Society, the iron railings have been removed from the west side of the Cloisters of Eton College, and it is believed that the gradual removal of those on the north side will take place unless better counsels prevail. By action of this sort the authorities give reason to those who urge the national control of valuable ancient buildings.

Exeter Cathedral.—It is distressing to have to report that work of drastic "restoration" still continues to be carried out at this cathedral. The string course under the parapet on the south side of the nave was being renewed last summer, and the old carved heads which appeared to be quite sound were being cut out and replaced by modern imitations. Work of the same nature was in progress on the north side of the nave. Scaffolding had been erected in front of the north porch, where the masonry showed no signs of movement, and, with the exception of surface decay, was quite sound. The renewal of the west front is still in progress. The jambs of the central porch with the canopies and mouldings have been renewed. Destructive work of a similar nature to that already mentioned is also being carried out elsewhere about the building.

Hardwick Hall, Derbyshire.—Extensive work of repair has been carried on during the past year on the lines of the Society's report. The external facework and mouldings have largely decayed owing to sulphurous pollution of the atmosphere. Much has fallen at touch, and more required to be removed before any lasting repair could be attempted. But no stone, or portion of stone, has been removed which it was thought possible to preserve by chemical treatment, and the result is that the hall, though looking somewhat cleaner than before, owing to the use of these preservatives, still keeps its authenticity, both in fact and appearance. Tiles bedded in lias lime and sand, and wedged into grooves, have been employed for the greater portion of this work, but in places exposed to the action of wet or exceptional strain Birmingham patent waterproof cement has been used in place of lime. Professor Church's baryta treatment, followed by a coat of lime water or Perpetium patent fixative, has been used for the chemical preservation of the sounder sur-

faces. In this way the north and west fronts have been dealt with, and it is hoped to complete the work on the other fronts before the autumn. Serious cracks, extending in many cases from top to bottom, exist in most of the turrets. The turrets have been tied by iron tie-rods, their outer portions buried in cement-concrete, and the cracks themselves have been tied externally with tiles across the joints and thoroughly grouted up. Internally much of the work of repair has been occasioned by the decay of the oak lintels, from leaky roofs or want of ventilation. Thus in the western turret a lintel has its end completely rotted away, and is being replaced with reinforced concrete. In the picture gallery all the floor and ceiling beams were examined. They appear to have been put in green—in such a hurry was Countess Bess to finish her building—and have twisted and shrunk to an extraordinary degree; but they have been carefully attended to in the past. Such places as were overlooked have now been repaired, and the plaster floors and ceilings made good. More serious was the condition of the oak beams across the bay windows and the arches above which carry the back sides of the turrets overhead.

Hardwick Old Hall, Derbyshire.—The ruins of the older hall have been repaired simultaneously with the newer building of Countess Bess, but on different lines, owing to the different state of the buildings. No attempt has been made to repair any of the ornamental work, but the work confined to merely keeping the walls together. The trees and vegetation have been removed from the tops of walls, which have been covered with cement-concrete, covered in turn with a layer of turf. The rotten oak lintels have been replaced with reinforced concrete. The remains of the modelled plaster frieze in the "Forest Great Chamber" and modelled overmantles of other rooms have been protected by small pent roofs of tiles, grooved and copper doweled into the wall above them, and the plaster itself treated with a special lime wash.

Iffley Church, Oxfordshire.—The Norman tower was found to be in an exceedingly unsatisfactory condition: cracks had appeared in the walling of the belfry stage, near the angle stair turret, and elsewhere, and the ashlar facing showed marked symptoms of decay. Inspection by one of the professional members of the Society disclosed the fact that the bell frame—badly framed and much decayed—was in actual contact with the south wall of the tower, and was obviously doing great mischief to the stability of the structure. A report, setting out the defects in detail, with suggestions for their treatment, was sent to the vicar, who with great energy set about raising funds. The work was put in hand last June, and all that the report advised has been done, under the constant supervision of the architect.

Langport Church, Somerset.—The tower is about 80 feet high, 19 feet square internally, and appears to have been erected in the fifteenth century. It is built of coursed lias limestone. The structure was in good condition, except where the limestone was eaten away at the joints by the action of the weather. The scaling surface of the stonework was cleaned off, and in those places where the decay was deep the joints were cut out to a sufficient depth and width to take pieces of slates or tiles bedded in blue lias lime mortar; these were inserted to form a proper key for the subsequent pointing. Five coats of baryta water were then brushed over the whole surface of the tower, and the joints were filled in flush with lias lime mortar. As many as thirty to forty coats of baryta water were sprayed on to the pinnacles and niches of the belfry and ringing chamber stages.

Oakham Castle, Rutland.—The committee state that the works of repair which they advised have recently been carried out by an architect in consultation with the Society. The chief work to the fabric consisted in arresting the thrust from the eastmost bays of the two arcades which divide the hall lengthways. The massive semicircular arches spring from carved corbels in the east wall, with flat buttresses on the outside. The thrust of the arches was pushing the wall outwards, and causing serious cracks in the arches and the wall over. It was found necessary to strengthen the east wall by the removal of the rubble core rendered loose by the forcing of the wall outwards, and to rebond the outer and inner faces together with blue lias lime concrete—from the foundation upwards. The wall was further strengthened by building up the six-light seventeenth-century window, which was a great source of weakness. The displaced stones in the arches were refixed in position, and the open joints grouted in afresh. The walls above the arches were then strengthened by the insertion of a horizontal brick lintel between the outer and inner facing stones, which will help to relieve the arch of the weight of the wall and the roof over

it. It will also act as a tie to the east wall, and prevent further movement.

Salle Church, Norfolk.—Previous to the Society being asked to undertake the necessary works of repair there had been, unfortunately, considerable restoration. The roofs over the north and south aisles afford an excellent example of the result of the Society's method of repair as against "restoration." Here are two roofs erected at the same period, and practically in the same condition of decay. The north one has been carefully repaired, and every portion of the old oak retained that was possible, with the result that it looks as if it had never been touched since its erection. The south one looks modern—as it is—for in the process of "restoration" the roof was taken down, and it requires to be closely looked at to see the few remaining old portions which are entirely lost among the new. Needless to say, the restoration work was carried out under a contract, and probably cost twice as much as the repair work. The roofs to the north porch and the south transept have also been repaired in a manner similar to that described in the case of the north aisle. The different methods of dealing with the work is also shown in the parapets on the north aisle and the nave.

Court Lodge Farm, Udimore, Sussex.—It is very distressing to have to report that this fine old house has been dismantled, and by the time this is printed will no longer be in existence. The National Trust and this Society have taken action from time to time for many years with a view to the preservation of the building. This Society even went as far as to prepare a scheme for adapting the building as cottages, but the owner could not be persuaded to agree, and a valuable record of ancient building methods and art has therefore been destroyed. It is understood that two new cottages are to be built from the proceeds of the sale of the old material.

St. Swithin's Church, Worcester.—The committee has much pleasure in reporting that the proposed scheme for the "restoration" of this church has been abandoned, and that the necessary works of repair are being carried out under the Society's auspices.

R.I.B.A. EXAMINATIONS.

THE FINAL: ALTERNATIVE SCHEME OF TESTIMONIES OF STUDY.

IN accordance with the notice already published in the "Kalendar," the alternative Scheme of Testimonies of Study for the Final Examination will come into operation at the option of the candidates in November next, and after the end of the year 1913 the existing Testimonies of Study for this examination will be abolished. Six alternative problems in design will be set by the Board of Architectural Education each year, and candidates for the final examination must submit designs in answer to at least four of these problems. These alternative problems will be published twice a year, three sets in January and three in July. This is done for the convenience of candidates, but it must be distinctly understood that the time for sending in the designs in answer to these problems is strictly limited. Thus the designs for Subject IV. must be sent in to the Secretary R.I.B.A. by August 31, 1912; those for Subject V. by October 31, and those for Subject VI. by December 31. (This time will be extended for students in the Colonies; see dates following list of subjects below.)

The drawings must be on imperial sheets and candidates must affix their full name and address to each drawing submitted.

The subjects for the second half of the year 1912 are as follows:—

Subject IV.

(a) A senate house, on an isolated site, for a modern university, to consist of a council chamber to seat sixty persons, with ante-room, waiting-room, and cloak-room, and two committee rooms each to seat twenty persons round a table. Plans, sections, and elevations to be to $\frac{1}{8}$ scale. Details both external and internal to $\frac{1}{2}$ -inch scale and shaded.

(b) A bridge carrying a road 25 feet wide between parapets over a canal 40 feet wide. The bridge may be built of brick, stone, or ferro-concrete. Drawings to be to $\frac{1}{2}$ -inch scale and to show complete construction. Important details to 1-inch scale. Calculations to be given.

Subject V.

(a) A picture gallery in a public park, consisting of six galleries of varying size, but of not more than 8,000 sup. feet

in all. The galleries are to be arranged with cloak-rooms, &c., so that they can be used for receptions. A room for a curator and a packing room are to be included. Plans, sections, and elevations to be to $\frac{1}{2}$ scale. Details both external and internal to $\frac{1}{2}$ -inch scale and shaded.

(b) A village church to seat 300. May be in any style, but with complete details of construction. Drawings required to $\frac{1}{2}$ -inch and $\frac{1}{4}$ -inch scale.

Subject VI.

(a) A colonnaded screen, 100 feet long, joining two wings of a public building 60 feet high. The screen to have two carriage entrances through it. Shaded drawings to $\frac{1}{4}$ -inch scale with 1-inch scale details.

(b) A fire-resisting lock-up warehouse on a site 40 feet \times 80 feet, with two frontages 40 feet wide to two parallel streets. The site is between buildings so that no light can be obtained on the 80 feet sides.

The building is to have six storeys, and each floor is to be capable of sustaining a load of 4 cwt. per sup. foot. Drawings required $\frac{1}{2}$ -inch and $\frac{1}{4}$ -inch with $\frac{1}{2}$ full-size details of important parts of any steel construction.

N.B.—A sketch perspective may be included in any of the foregoing, but is not compulsory.

Dates for Submission of Designs.

	Subject IV.	Subject V.	Subject VI.
United Kingdom...	August 31, 1912.	October 31, 1912.	December 31, 1912.
Johannesburg ...	October 31, 1912.	December 31, 1912.	February 28, 1913.
Melbourne...	November 30, 1912.	January 31, 1913.	March 31, 1913.
Sydney ...	November 30, 1912.	January 31, 1913.	March 31, 1913.
Toronto ...	September 30, 1912.	November 30, 1912.	January 31, 1913.

The attention of candidates is called to the revised syllabus of the Intermediate and Final Examinations which comes into operation in November next. The syllabus is published in the "Kalendar." Attention is especially called to Subjects I., II., III. (F) of the Final.

THE MADRAS ARCHITECTURAL SOCIETY.

WITH a view to facilitate the general advancement and study of architecture, engineering, and other arts and sciences connected therewith, a Society under the above designation has been organised. The necessity for one has long been felt, and the above is the outcome of the spontaneous exertions of all those who are interested in the art. The first general meeting of the Society was held on March 15, in the Mahajana Sabha Hall, Mount Road, Madras.

The general meeting commenced at 6 p.m., when there gathered a large number of gentlemen on an invitation issued by Messrs. R. J. P. Enright and V. T. Srinivasa Aiyangar, B.A., B.C.E., of the Public Works Department.

Mr. W. J. Waghorne, F.R.I.B.A., occupied the chair.

Mr. C. L. Narasimhayya briefly explained the objects of the Society, and read out its draft rules, which called forth some discussion.

Mr. V. S. Gnanaprakasam Pillai, C.E., in a short speech, proposed Mr. W. N. Pogson, F.R.I.B.A., to be the President. The proposal was seconded by Mr. V. Daivasikhamani Pillai, A.M.I.C.E., and unanimously carried.

Mr. W. J. Waghorne, F.R.I.B.A., and Mr. W. G. Molesworth were elected Vice-Presidents of the Society.

Mr. R. J. P. Enright and Mr. C. L. Narasimhayya, B.A., B.C.E., were elected Joint Secretaries.

The following gentlemen were elected as members of the Executive Committee:—W. N. Pogson, Esq., F.R.I.B.A. (President), W. J. Waghorne, Esq., F.R.I.B.A., and W. G. Molesworth, Esq. (Vice-Presidents), R. J. P. Enright, Esq. (Secretary), M. R. Ghadi Ali, Esq., B.Sc., M.R.S.I., M.R.Ry. V. T. Srinivasa Aiyangar, Avl., B.A., B.C.E., M.R.Ry. R. Narasimha Aiyangar, Avl., B.A., B.C.E., M.R.Ry. P. A. Venkatarama Aiyar, Avl., B.C.E., M.R.Ry. S. Rajagopalaswamy Mudaliar, Avl., B.C.E., M.R.Ry. V. Daivasikhamani Pillai, Avl., A.M.I.C.E., M.R.Ry. V. S. Gnanaprakasam Pillai, Avl., C.E., M.R.Ry. P. C. Gopalaswamy Naicker, Avl., M.R.Ry. T. M. Daivasikhamani Achariar, Avl.

Mr. T. M. Daivasikhamani Achariar moved a resolution requesting his Excellency Lord Carmichael to deliver an inaugural address before his departure from Madras.

After some introductory remarks, he spoke as follows:—Gentlemen,—You are already aware that his Excellency is considered as second to none in matters artistic—the mistress art of architecture—and that he takes a very keen

interest in all matters tending to promote such arts during his all too short a tenure of office. It was only a few months ago he presided over the deliberations of experts regarding the museums and their management. He said in his opening speech that he spoke there only as an amateur. But, in fact, as one of the experts present pointed out, his Excellency's speech was a suggestive one, indicative of a masterly mind. It created in the minds of many a hope that the deplorable gap left by Lord Napier would soon be filled up by his Excellency Lord Carmichael after a lapse of about a quarter of a century. That was not to be. Possibly we may have to wait for another quarter of a century before we could get a Governor who may unreservedly open up his mind to the public at large, as was done by Lord Napier on building matters. He delivered a series of lectures on fine art and architecture, and in the latter he deplores the lamentable plight of Madras and the crass ignorance—nay, the indifference—of the people of this Presidency on building matters and the choice of suitable styles and materials for their dwelling-houses. He also touched upon the various styles of buildings as best suited to the conditions and the requirements of the Indians, and chalked out an even course for the builders and designers of Indian buildings. He exhorted the Indians to consult an expert architect or a master builder to assist them in planning their houses according to the modern needs. Gentlemen, he readily admitted the insuperable difficulties attached to the planning of Hindu houses in consistency with the principles laid down by the great "Manai Shastra," or the Hindu Science of Building, which enjoins on all Hindus to adhere to some particular dimensions, style, and the number of pillars, valleys, openings, &c., on pain of disastrous effects on the delinquent owner.

Gentlemen, we find, however, that these sorts of obstacles were overcome by some of the architects, such as Messrs. R. F. Chisholm, Brassington, and others, who have successfully adapted Anglo-Indian styles in designing some important buildings. These gentlemen and other toilers in the same field laboured with a diligence beyond praise, but the work was too great for individual exertion, and much of their work remained fragmentary and incomplete.

Gentlemen, the question of paramount importance to-day is not who is to be blamed for the existing state of things, but what policy is to be adopted so that, as far as possible, the Madras Presidency may be spared some of the worst features of the modern hideous styles with the help of the great traditional architecture which she still possesses. The indigenous architecture, including town-planning and temple-building, in India generally flourished under the patronage of kings and princes, and the decay or degeneration which began in the time of Aurangzeb or Raja Raja Chola of the Dravidian country still accelerates.

Now, gentlemen, the signs of the times are very favourable both to the European architects and to the Indians of this Presidency. Madras is passing slowly through a period of transition, the ultimate upshot of which none can foresee. There has been a vast change from the Madras of those days to the Madras of to-day. What was prohibitive to the conservative Hindu mind some twenty years ago is recognised as almost a necessity to-day. It only requires some ingenuity and effort on the part of the designer to reconcile the Indians to the European methods of designing, and Hindu gentlemen are perfectly satisfied provided they are given a sufficient accommodation and a presentable frontage consistent, as far as possible, with their traditions. It is high time now, gentlemen, that we should work in that direction, and attempt at the refining and remodelling of the domestic architecture of the Hindus in this Presidency by teaching them to aim at simplicity and dignity, availing ourselves to the full extent of the magnificent resources of the country as regards materials and workmanship, rather than leave them to dabble with all styles and proportions, only to puzzle the historians of a future age. We are the custodians of our own age, and posterity will rightly blame us if, by our own neglect, we forego the opportunity of sitting at the feet of the best authorities on building matters and listening to the words of wisdom issuing from their lips. We have now the good fortune to be able to listen to the expositions of the learned men of the profession. How could we Indians achieve the end in view unless we invite the best exponents of the art like his Excellency, and draw inspiration from their edifying speeches? This is not only one of the best ways of educating public opinion, but also of fostering the growth of a good architectural training in this country on indigenous lines.

In support of my view, I beg to quote from the annual report of the architectural work in India for 1909-10 by

Mr. J. Begg, F.R.I.B.A., the head of the architectural profession in India, who is bestowing his attention to the training up of many Indian architects. The scheme which he proposes is a different one, but the necessity for the remedial measures suggested by him is clearly dealt with in it from a different standpoint of view. He says: "There are at present so comparatively few good architects' offices in India that we can do but little, but what little we can it behoves architects to do in the direction of encouraging the growth in the country of the profession on indigenous lines. Whatever we can do to induce members of the better educated community to put their sons into the profession will be all for the good of the country, and will tend to open up careers for a number of those who at present flood the overcrowded professions of the law, medicine, or who seek employment as Government clerks. Moreover, it would tend in the right direction in the interests of the profession itself. It would help to create a class of efficient assistants, the want of which in this country is perhaps the cause of the greatest difficulties with which the architect in India has to contend, whether he be in Government employment or in the private practice. It is our own work that we have to regard as our first care. I am inclined to think that a special effort should be made at this juncture to induce Indians to come forward."

Gentlemen, as this Society intends also to supply the gap in the present architectural education in this Presidency, we shall hope for a day when we may confidently anticipate the gradual growth of a new culture and style combining all that is best in Eastern practice and ideals, revitalised by transfusion with Western ideas through the instrumentality of this Society, for no one here can deny that societies of this kind may not serve to attain perfection and make one reach the height of one's ambition. The very desire in one to excel when accompanied by earnest work must tend at least to improvement, and every step gained in the ladder of knowledge will give additional pleasure, for the higher one mounts the more beautiful and the more extended does one's view become.

The meeting accepted the resolution unanimously, and the Chairman was authorised to communicate the resolution to his Excellency.

Mr. Pogson, F.R.I.B.A., President-Elect, rose amidst loud cheers, and made a happy and interesting speech, in the course of which he thanked the members for the honour done to him in electing him as President. He emphasised the importance of harmonious co-operation of both the architect and the engineer in this country, inasmuch as the architect could not do without the engineer any more than the engineer could do without the architect. He hoped that under the auspices of this Society classes would be started for architecture and the allied arts, and looked forward to the final affiliation of the Society with the Royal Institute of British Architects, London. The Society should for this, in his opinion, look forward for help to the Fellows of the Royal Institute of British Architects, one of whom was the Society's Vice-President, Mr. W. J. Waghorne. He then dilated upon the importance at present of the study of different styles and upon the facilities afforded therefore by the new city of Delhi, which he hoped would be a living history in brick and stone of the happy fusion of India and England. He then referred in thankful terms to the energetic endeavours made towards the formation of such a unique Society like this in India. He thanked all present for their co-operation in the work of the Society, and gave an assurance to contribute everything in his power towards the well-being of the Society. In concluding, the Chairman referred to the excellent work which was being done by the Royal Institute of British Architects, London, and the Architectural Association, London, and he felt sure that this Society also would receive every possible support from them. He laid stress on the importance of co-operation and earnest individual research, without which nothing materially beneficial could be accomplished by way of improving so noble an art as architecture.

The objects of the Madras Architectural Society are:—

(a) To promote the general advancement of architecture, engineering, and other arts and sciences connected therewith.

(b) To afford facilities for the study of architecture and to serve as a medium of friendly communication between the members and others elsewhere interested in the progress of architecture.

(c) To educate public opinion on the question of adopting suitable styles tending greatly to promote the domestic convenience of the citizens.

(d) To establish as far as possible uniformity of practice.

(e) To take such measures as to enable the public to distinguish architects as qualified by a competent authority from those not so recognised.

(f) To standardise the scale of charges for professional aid.

(g) To establish and maintain a library and a collection of designs, prints, &c., of interest, and a model-room for the use of the members.

THE UNIVERSITY OF SHEFFIELD.

THE results of the June examinations, 1912, in the Department of Architecture are announced as follows:—Diploma of Architecture.—First class, John C. P. Toothill; second class, Harry B. S. Gibbs. Certificate in Architecture.—First class, John H. Odom; second class, Henry B. Leighton and George A. Booker (on completion of design).

As the course for the diploma is a five years' one, and as the Department has now been open for five sessions, the Diploma in Architecture of the University of Sheffield is now awarded for the first time. The external examiner was Professor F. M. Simpson, F.R.I.B.A.

ILLUSTRATIONS.

ADDITIONS TO THE SURVEYORS' INSTITUTION.

THE opportunity for extending the building of the Surveyors' Institution arose through the formation of the new street on the south side of Great George Street. The new frontage thus acquired added to the site an oblique piece of land which it was not altogether easy to incorporate in the building as already arranged. The architect, Mr. Paul Waterhouse, has lengthened the big lecture hall on the first floor, and in order to take advantage of the increased space for the extension of the Council room adjoining he has finished the enlarged room with a bold bow window. This room is panelled throughout in oak. Beneath the Council room are additional offices for the staff and a new room for the Secretary is placed beneath the end of the lecture room. The builder is Mr. James Carmichael, of Wandsworth, and the work has been carried out under the superintendence of Mr. D. Kennedy, clerk of works. The following specialists were employed:—Stone and wood carving, R. Bridgeman & Son; fibrous plaster, G. Jackson & Sons; casements, Crittall Manufacturing Co.; sanitary goods, Shanks & Co.; marble columns, wall tiling and parquet, Art Pavements and Decorations, Ltd.; wrought ironwork, Hart, Son, Peard & Co.; heating, J. Jeffreys & Co.; electric lighting and telephones, Belshaw & Co.; chimneypieces and grates, Shuffrey & Co. and Bratt, Colbran & Co.; Council room tables and chairs, Maple & Co.

A KENSINGTON INTERIOR.

THE picture from which our illustration is taken is exhibited in this year's Royal Academy, and has been purchased by the trustees of the Chantrey Bequest. It is interesting also as an example of interior domestic architecture.

THE NEW OXFORD CIRCUS, LONDON.

THE corner of Oxford Circus shown is occupied as the premises of "Madame Louise," and is intended to be reproduced on the other angles as shown in Mr. Henry Tanner's drawing which hangs in the Architectural Room of the Royal Academy this year.

ENGLISH INTERIOR DECORATION.

THE drawings of No. 17 Fleet Street were made in connection with Mr. Bullock's series of articles on "Interior Decoration," now appearing in our columns, and will be found described in a chapter on British work which will subsequently appear.

It has been decided by the Cathedral Board, which was constituted for the building of the new Cathedral of St. Paul, Dunedin, New Zealand, to proceed with the building of the nave as soon as the necessary details and specifications can be provided by the architect, Mr. Edmund Sedding, F.R.I.B.A., of Plymouth. Otago stone will be used throughout, and as much of the local material as possible. It will be necessary to remove the existing pro-cathedral altogether.

INTERIOR DECORATION.—II.

By ALBERT E. BULLOCK, A.R.I.B.A.

FRANCE.—II.—THE EIGHTEENTH CENTURY AND AFTER.

(Continued from last week.)

STYLE has been said to be the elimination of the inharmonious and the unfit. One may however so rigidly apply the principles of a style as to lose much of its spirit and charm—the rhythm and decorative effect of its purpose—resulting in hard unsympathetic lines, even in the ornament and other parts intended to relieve the sense of monotonous repetition of features and parts. One rarely finds in French decorative work anything incongruous; each example taken on its merits presents a theme, complete in itself, testifying to the decorative instinct of the artist, his sense of proportion and knowledge of the limitations of his system.

Every style has its own stages of development, and perfection is not attained without that toning down which systematic elimination gives. The art lies in the knowledge of the extent to which such elimination shall extend. There is in the history of the art of any nation no century which more clearly exemplifies this theory than that of the period with which we are about to deal, which commences with the Régence and ends with the Empire styles of French art.

It would seem that the age of Louis XV. aimed at obliterating the work of his predecessor in the desire to produce the exuberant pleasure houses and palaces, the decorations of which frequently exhibit great want of repose. It was not until the latter half of the reign that decoration really settled down to a systematic expression worthy of a great nation, which was at once a refined edition of Louis XIV. work, chaste in detail and dignified in design, under the commanding genius of Gabriel.

The Petit Trianon, begun in 1762, and Rousseau's Hôtel Salm Salm, completed in 1786, give just those qualities which make for a permanent living architecture, and indicate the high-water mark of the French development in art. The decadence depicted in much of the later work must be put to the credit of the political struggles which followed, such work being carried out under the direction of men of the stamp of Boulée and Chevalier. The triumphal return of the soldiers from Italy after the conquests referred to in the last article was akin to the incident of biblical record of the Israelites' return from viewing the "Promised Land." The new art was taken up with zest. Its application was at first direct, inasmuch as native talent from Italy and elsewhere was invited and encouraged in France. The establishment of Colbert's school at Rome under Errard, de Troy, and their successors, however, gave the opportunity to students to train on the native soil the best examples, prior to their employment on the national monuments where "le style Français" was gradually developed. The activity of the François Première period was eclipsed by Louis XIV. The glory of Meudon was surpassed by Le Brun at Versailles. The evolution from the transitional stage has been traced by other writers from the old fort of Langeais (1460) to Gaillon, Blois, Azay-le-Rideau (1526) and other château of the Loire valley.

It is characteristic of French architecture, and decoration in particular, that throughout all the periods of the Renaissance art there are traceable certain recurring forms of ornament and decoration. It has been shown elsewhere that the so-called Mansart roof was practised at the Louvre by Lesnot; the familiar oval ornament which carries a festoon practised by Gabriel had appeared with Perrault's work there, and the panel treated with small mitred angle breaks so frequently used in Louis Seize decorations existed in a coarse form at Alençon. Throughout the period of Louis XV. one may trace the influence and the repetition of many exact features from Louis XIII. examples and earlier, only more highly floreated, in the rocailles and scrolls. The same may be said of the planning of rooms, especially bedrooms, which latter retained the alcove partitioning from very early times throughout each era even to modern days.

The example of the Henry IV. room, for instance, illustrated in the last article, is typical of the plan referred to here. These bed recesses are open to the room, but closed in on the other three sides, there being a passage on one side forming the entrance. This room forms one of the earliest examples in which embossed and painted leather was used as a decoration. The use of leather was adopted very largely in later decorations, being carved and moulded into various shapes and patterns, in much the same manner that papier

maché was in England in the sixteenth century for ceiling decoration, before plaster came into general use.

The opening years of the eighteenth century witnessed a series of European wars consequent upon the mistakes made by Louis XIV., which resulted in the formation of the Grand Alliance of England, Holland, and Austria. Of the wars which ensued the most decisive was that of Blenheim, when Vienna was saved by Marlborough and Gibraltar fell into the hands of the English nation. The Peace of Utrecht, signed in 1713, recognised the Hanoverian succession of England, settled for a time the general European status, and was the signal for much colonisation in Canada and elsewhere.

In the latter part of this reign the elderly Fleury undertook the task of steering the country through a maze of threatened wars and intrigues, France being at peace with England, partly from a necessity which was patent to both Fleury and the Parlement, and also because his policy was never of an aggressive nature, which necessity was the national deficit of 78,000,000 livres bequeathed by Louis XIV. upon his decease. Cheese-paring usually leads to cheap art, and the striving after a sumptuous effect which is so distinguished a feature of the productions of the reign of Louis XV. was doubtless largely due to this cause, together with the reaction consequent upon the absence of the former controlling power in matters relating to the arts of decoration and design. The period was largely the opportunity of the painter, as is evidenced by the tapestries of Boucher and others. In the following reign strong verticality is observable in the architecture, the decorations, and the upholstery.

The three reigns from Louis XIV. to Louis XVI., however, really form one organic style, the change apparent in the reign of Louis XV. forming the transition, from which the terms Régence, Rococo, and Rocaille express the feeling of the art. Much of the early work was restored in subsequent years, as, for instance, Goujon's vault to the great staircase at the Louvre built in 1662, which was restored and completed by Félix Duban as late as 1849-53 (see also *The Architect*, 1894, November 23, p. 330). While the luxuriance of the early years of the century is responsible for the appellations above referred to there was much simple work done also in panelled rooms at Versailles, Fontainebleau, the Petit Trianon, and the Louvre, which strike a quieter note. During the Régence of Philip of Orleans (1715-22) the chief exponents of the style were Robert de Cotte and Germain Boffrand. There are many examples of very good work of this period of the type of Madame Du Barry's residence at Luciennes, &c. This was followed by the Rocaille style practised by the decorator Nicholas Pineau and his son Dominique, the typical features of which are the sculptured dado mouldings and the frequency of mirrors. At the Château de Rambouillet the Petit Salon is carved in wood in this style.

Pineau went with Le Blond to Russia in 1716 and continued the work at Potsdam upon the death of Le Blond in 1619, where he carried out, *inter alia*, the decorations to the music room in the Altes Schloss. He returned to France in 1729 and worked in the Salle d'Hercule, Versailles, which is one of the last instances of the extensive use of marble as a decorative material practised in the reign of Louis XIV. under Le Brun and Mansart. The theme here is green and gold on a white background. There were two large paintings by Paul Veronese, which formed part of the decorative scheme and were set in frames by Verbrecht and supported by gilt-bronze ornaments by Antoine Vassé, a pupil of Puget. One of these pictures is now at Fontainebleau and the other in the Salon Carré, Louvre. An example of Pineau's work also exists at the Hôtel d'Evreux (now the Elysée), begun by Mollet in 1718. Pineau's decorations were carried out when Madame de Pompadour was owner of the residence. He was a great friend of Jules-Hardouin Mansart and worked with his son Dominique in 1750 at Asnières on Mansart de Levy's château for the Marquis de Voyer; and the Hôtel de Luxembourg contained some of his work and later received alterations by Carpentier, a pupil of Jacques Jules Gabriel. The grand salon here was decorated by Natoire and Hallé. Both these buildings have since been divested of their decorations.

The Hôtel de Soubise contains many rooms of this period. In 1702 Gabriel Blanchard worked there, Natoire from 1736-39, and the sculptors Lambert-Sigisbert Adam and Jean François Lemoyne about the same time executed the groups in the Salon Ovale. The interior decorations were in active progress from 1702-45. A bedchamber from this building indicates the prevailing method of treatment and is taken from César Daly's work. Boffrand, who built the façade to the Arsenal in 1718, succeeded Delamare in the decorations to the Golden Gallery at the Hôtel de Toulouse, which was

commenced by Robert de Cotte in 1717. The decorations to the Salle des Manuscrits at the Arsenal date about 1745.

(To be continued.)

ARTISANS, CABINET MAKERS AND TRADES.

Jean Cousin (Painter of Glass and Sculptor)	1500-1589
Bernard Palissy (Huguenot Glass Painter)	1510-1588
Claude Mollet (Gardener to Henry IV.)	-1613
Claude Ballu (Jeweller)	1615-1678
Jean Lepautre (Designer)	1617-1682
César Bagard (Wood Carver)	1639-1709
André Charles Boule (Chief Cabinet Worker)	1642-1732
L. Vander Meulen (Carver)	fl. 1645
Guillaume Dupré	fl. 1650
André Charles	fl. 1648
Daniel Marot (Designer and Architect)	1650-1700
Claude Ballin (Goldsmith)	1660-1754
Jean Tijou (Metal worker) in England from	1687-1711
C. C. Saumier (Cabinet Maker)	-1752
Thomas Germain (Architect, Sculptor and Goldsmith)	1673-1748
Jacques Caffieri (Cabinet Maker)	1678-1755
P. E. Babel	-1761
François Richard Lalonde (Cabinet Maker)	1685-1765
Charles Cressant (Mounts for Furniture)	1685-1768
J. F. Oeben (Cabinet Maker)	-1767
Le Sieur Dagly (Gobelins, Japan Ware)	fl. 1713
La Jone (Painter of Architecture)	1687-1761
Nicholas Lancret (Painter)	1690-1743
Jean Dubois (Cabinet Maker)	fl. 1760
Vernis-Martin (Carriage Painter)	1701-
A. Weiswiler (German Cabinet Maker)	-1778
Jean Jacques Caffieri (Cabinet Maker)	1725-1792
Ferdinand Berthoud (Swiss Jeweller)	1727-1807
Jean François Riesener (Cabinet Maker)	1735-1806
André Jacques Roubo (Cabinet Maker)	1739-1791
Salembier (Decorator)	fl. 1775
Le Quay (French Gilder)	fl. 1775
J. E. Leleu (Cabinet Maker)	fl. 1775
Jean Guelder Oppenord (Cabinet Maker)	fl. 1775
Roucel (Jeweller)	fl. 1775
P. Gouthière (Metal Worker)	1740-1806
David Röntgen (German Cabinet Maker)	1743-1807
Thomire (Metal Worker)	1751-1843
G. C. Erasmus (Dutch Furniture Maker)	fl. 1780
Martin Carlin (Cabinet Maker)	fl. 1780
François Gamain (Ironworker)	fl. 1760-1799

THE NAMES OF ARTISANS OF WHICH THE DATES ARE UNCERTAIN.

François Chef-de-Ville (Gem Cutter)
 Domenico Cucci (Joiner)
 Claude de Villers (Silversmith)
 Bailly (Tapestry Weaver)
 Philibert Balland (Embroiderer)
 Etienne de la Belle (Engraver)
 The Camaye (Tapestry Weavers)
 The Comans (Tapestry Weavers)
 Jean la Croix (Tapestry Weaver)
 Debonnaire (Silversmith)
 Galle (Cabinet Maker)
 Simon Jaillot (Ivory Carver)
 The Kellers (Bronze Workers)
 François de la Planche (Flemish Tapestry Weaver)
 Louis Dupont (Tapestry Weaver)
 Pierre Dupont (Tapestry Weaver of the Savonnerie)
 Simon Fayette (Embroiderer)
 Gachetti (Florentine Lapidary)
 Jans (Tapestry Weaver)
 Alexandre Fortier (Jeweller)
 Van Kerchove (Dyer)
 Jacques Somer (Parquetry Worker)
 J. W. Meil
 Baudren Yvart (Designer of Tapestries)
 Megliorini (Florentine Lapidary)
 Merlin (Silversmith)
 Mynuel
 Warin (Master of the Mint)
 Viancourt (Silversmith)
 J. Francart (Designer)
 Pierre and Jean Lefebvre (Flemish Weavers)
 Simon Lourdet (Tapestry Worker)
 Mosin (Tapestry Worker)
 Remy (Embroiderer)
 Pierre Gabriel Berthault (Engraver)

Duplessis (Bronze Worker)
 Winant (Bronze Worker)
 Hervieux (Bronze Worker)

THE LONDON SOCIETY.

A MEETING of this Society was held at the Royal Society of Arts, Adelphi, on Thursday, June 27, when there was a discussion on Mr. Raffles Davison's paper read at the previous meeting, entitled "London as it is and as it might be." Professor Beresford Pite, F.R.I.B.A., occupied the chair.

Colonel R. C. Hellard, C.B., opened the discussion by explaining the principles on which the recommendations as to the proposed new roads in the report of the Traffic Commission have been made. In his opening remarks, he said that he proposed to consider some of the matters which affected the bulk of the inhabitants in their everyday life, and to deal with them from a practical standpoint. There had been numerous schemes for the betterment of London, but in his opinion all such proposed expenditure should be based on some utilitarian gain. There were two things absolutely essential to successful improvement. The first was a general scheme to which all improvements should conform, and the other was co-operation between the different authorities. A great deal of preliminary investigation has already been made, from which other people might draw profit. There were, for example, the annual reports issued by the Board of Trade, and particularly those for 1910 and 1911, in which road plans for the whole of London are given. The preliminary investigations which had to be made before such a road plan could be prepared were very numerous. In those reports, he said, a general plan embracing the whole of the London area was for the first time laid before the public. In every case the ground had been walked over very carefully either by himself or by Lieutenant Fishbourne, R.E. He was satisfied that there were no very serious engineering difficulties involved along any of the proposed lines; but they might be blocked by new buildings at any moment. He deplored the production of mere paper schemes, the preliminaries of which had not been worked out on the ground. In one instance, the proposed road was represented by a geometric circle, and would be absolutely impossible to carry out. Such schemes distracted attention from properly-thought-out ones. The only chance for success was to get each portion of the general plan accepted in principle by all those interested, and to concentrate attention on it and to secure the co-operation of all concerned. A few years hence, if no such scheme were adopted, the town-planning schemes would have matured independently on local lines, regardless of the general requirements. Of the 125 miles of new road suggested, something like forty miles passed through areas of town-planning schemes now under consideration, while at least another twenty lay across open agricultural ground. Besides these sixty miles of comparatively inexpensive road that might so easily be made, some twenty-five miles of road was already under the consideration of the authorities—namely, the Brentford by-pass, the Cromwell Road extension, the Croydon by-pass, and the Kingston and Surbiton by-pass. These figures reduce the original mileage to very much more negotiable proportions, and should allay exaggerated estimates of costs. It was unfortunate that the first road to be considered should be the one starting from Cromwell Road and going on to Brentford. The cost of this was estimated at £1,750,000, although the road was only ten miles long. In this case each of the two miles to be carried out in the County of London would cost £500,000, the next two miles £250,000 each, and the remaining six miles £250,000 altogether. So much of the roads suggested by the Board were to be made in the country that it might be safer to judge its cost from comparison with the last six miles just mentioned. As regards the improvement of existing main roads, it was of great importance that building lines should be laid down, so that when leases fall in advantage might be taken of setting back the frontage to conform to the scheme of widening. This suggestion applies particularly to villages and to such roads as are flanked by forecourts or gardens and by one-storeyed shops. There are many other points which might be advocated, such as the reservation of prominent sites for important buildings and the formation of grass verges and the planting of trees and shrubs, so as to ensure dignified approaches to London. No important site should be allowed to be occupied by some hideous small building which will spoil the

* A report of this Paper and the subsequent discussion appeared in *The Architect*, May 31 and June 7.

aspect for ever. It had been suggested that no plans of commercial buildings should be passed unless they made provision for the unloading to be clear of the street. Provision for such loading and unloading might be insisted on, with great subsequent advantage.

Mr. Paul Waterhouse, M.A., F.R.I.B.A., said he fancied that all who were gathered there that night were practically so united that difference of opinion would be more or less impossible. They were met to discuss the masterly paper delivered at their previous meeting by Mr. Raffles Davison, and he should like to thank Mr. Davison for having put before the public the aims and the scope of the London Society in such a way as was calculated to lure their attention. Nothing could be done without an absolutely solid basis of fact, especially with regard to those difficulties which are the driving forces for the improvements to which the members looked forward. An immense amount of work had been done in a most tremendously conscientious way in the preparation of the Traffic Reports by the Board of Trade. Colonel Hellard had deprecated certain kinds of improvement schemes. One of the cheapest of the smaller pleasures of life was to make imaginary displays of ingenuity when sitting comfortably in a chair with a pipe, a pair of dividers, and a map. Personally, though something of a sinner on that score, he quite realised that it was a very futile sport unless such schemes are followed up by hard walking and hard riding over the ground. All those studies should be based on practice. In architecture, which he took to be the greatest of all arts, they had an extraordinary conviction that beauty and utility could go hand in hand. He believed that the problem before them was the same as architecture on a small scale, and that it was the duty of the London Society to see that the whole of the solutions put before them should be wrought out as works of art. If the art did not exist now there was no reason why it should not exist in the future. The maps from the Traffic Board's reports which had been shown by Colonel Hellard revealed in a most extraordinary way where the shoe pinched. If the shoe did not pinch, those of them who loved London would say "For Heaven's sake leave her alone." But they knew that they could not leave her alone for she was in agony, and something must be done. It was fitting that the birth of the London Society should coincide with the moment of extreme agony. He would like to plead very urgently for the use of by-passes in the villages on the outskirts of London to which allusion had been made. In Edgware they had an instance of what a terrible thing it was to mutilate a village street. Use and beauty would both be served by employing the by-pass system. A good street might in that way be formed parallel with the principal street. Such a course would save it. The Euston Road was about to become a most successful instance of what could be done. It was the last chapter of a very sad history. The Act of Parliament was intended to preserve a comfortable width; but the Act was powerless against the local authorities. The London Society would help in the future to stiffen public opinion and prevent a recurrence of calamities of that sort. In February of last year he had read a paper on London Improvements before the Royal Institute of British Architects. It had then occurred to him that being really an artistic problem, in the large sense, it was one in which the work of art at which they aimed must be in the long run carried out by artists. If the public sought for artists, some of them must be architects. His own suggestions were that there would be no difficulty as regards the actual house-building in exercising a censorship over designs, just as now the district surveyor does over the observance of the Building Act, and the borough surveyors do over the sanitary matters. The authorities should engage someone to see that the plans are at least up to a certain standard. It seemed to him that there would come a point where an artist or artists must be engaged.

Mr. Arthur Crow, F.R.I.B.A. (District Surveyor of Whitechapel), said that the roads recommended by Colonel Hellard were all excellent for taking people into and out of London, and that was, of course, absolutely essential. He hoped that something would be done to put the tramways on a better footing. At present something like £100,000 was contributed by the trams towards the improvement of the roads. But the tramways did no harm to the roadway, while the motor buses who contributed nothing, did. What he complained of was that the main question of the traffic problem in the centre of London was left untouched. There could be no doubt that the volume of traffic through central London would be increased very largely after the construction of the proposed docks. That problem called for immediate attention, and the roads should be dealt with in order

to give increased facilities. Mr. Crow then placed on the screen views of possible improvements and illustrations of defects in the existing law which permitted buildings to be re-erected to excessive heights on narrow streets, and the perpetuation of extremely awkward projections.

Mr. H. H. Gordon, L.C.C., said that the Road Board could only make a grant of one and a half millions towards the cost of the improvement. That amount had to be allocated among any number of local authorities. The question which first arises before each local authority concerned is "How much are we likely to get out of it?" The London County Council argue that it should be allocated in proportion to the cost which the scheme entails in each locality; some local authorities answer, "No, we want it in proportion to the population"; while others wish it to be divided in proportion to the rateable value. Every scheme is therefore at once divided by the different opinions held. All the efforts of the Road Board seemed to be concentrated on the provision of exits out of London. But it appeared to him that the improvements needed in the centre of London were far more important than those on the outside. Those who had to execute improvement schemes had to reckon the cost. The party now in power in the London County Council hold that improvements must on no account exceed a 5d. rate, no matter how urgent they may be. He believed that the amount which was lost by the non-improvement of London far exceeded the amount paid in actual rates. He calculated, for instance, that the speed of motor-buses in the central area surrounding the Bank was something like three miles an hour. If by means of widening they could attain a moderate result of six miles an hour the London General Omnibus Company alone would save £50,000 a year. The latter figure was apart from the saving of time by the passengers. Merchants complained of the cost of getting goods through London. If one aggregated all these and other items, one would arrive at an enormous total, far exceeding a 5d. rate. The preliminary step towards putting an end to this seemed to him to be an administrative one. They would never have an improved London as long as they had a London that was not unified. There are at present too many conflicting authorities. It was essential that the control, maintenance, and provision of highways should be under one central body. That conclusion had also been arrived at by persons like Sir John Wolfe Barry, who had studied the question purely scientifically.

Mr. Raymond Unwin, F.R.I.B.A., remarked that they might remember the experience of another great capital, and the steps its inhabitants had taken to meet their difficulties. Berlin used to have a frightful congestion of traffic in the centre, and likewise a multitude of local authorities carrying out town-planning schemes. Things were getting so hopelessly muddled that they held a competition which proved that nothing but a central authority would do. Now whenever a local authority forms a town-planning scheme it must embody the main lines of the central scheme. In London also they must constitute a central authority. But the present Government declare that they are not prepared to have any body created like the Water Board. What the Society should do would be to go to the Government and ask what they were going to do in the matter—pointing out that some central authority was essential. A question which had to be considered was whether in a city like London it was the best policy to unite its railway stations or to scatter them. In Berlin the general scheme seemed to be to save the road traffic from station to station. In London they had got to test whether it was the right thing to take Charing Cross station across the river, or to link it up with St. Pancras, Euston, and the other stations north of the Thames. These, and similar problems could only be adequately investigated by a central authority. He would suggest that the London Society should concentrate all its efforts to inducing the Government to create such a body as being the first step towards the improvement of London.

Professor Beresford Pite, F.R.I.B.A., in putting the vote of thanks, said he would like to give what weight he could to the remarks made by Mr. Unwin. They realised what the Government had done in forming the Traffic Department of the Board of Trade. Colonel Hellard had put a magnificent scheme before them. The point he wanted to emphasise was that no power existed for giving effect to these schemes which the Government have prepared for the public information. There was a serious need for legislation for London at the present moment, not only for the creation of the roads described by Colonel Hellard, but for the harmonising of the different interests which circle round the great Metropolis, and which concentrate themselves on this great

question of road-making. They were gathered together to discuss the London of the future—not merely a more useful London, but a more orderly London.

Colonel Hellard, in acknowledging the vote of thanks, said that the expense of dealing with roads in the centre of London was regarded as so prohibitive that he had concentrated his remarks on the outskirts. For a given sum of money, one got ten times the result on the margin of London that one would in the inside. Probably twenty times would be a correcter estimate. If the present town-planning schemes were not availed of, the citizens would never get another opportunity.

THE PAINT AND VARNISH SOCIETY.

(Continued from last week.)

THE testimony of officials in the Admiralty supported the other witnesses to the durability of leadless glazes, but both the Admiralty and Prisons Department had found such ware 10 per cent. dearer. The War Office Report was not exactly favourable to it. The evidence of the Post and Telegraphs Department "considered the products were quite equal to those glazed with lead, and not more costly"; and the salt glazed brown insulators were more efficient than white ones, which contained lead; though subsequent statements were in favour of using leadless glaze insulators for short rather than long-distance lines. But an expert electrician favours porcelain insulators for high-tension currents, inserted in switchboards of generating and distributing stations, coated with leadless glaze, as answering quite the same purpose.

The conclusion to which we are driven is, manifestly, that a longer trial should be given to leadless glaze.

If it is not yet proven that lead can be eliminated entirely from the potting industries, it is evident that its use should be greatly diminished in many instances, and abolished in others.

And the same may with equal justice be said for the paint-making and painting trades.

These conclusions are substantially in accord with the recommendations of the International Association for Labour Legislation, as adopted by delegates at their meeting, held in Lugano in September, 1910.

That conference recommended the enforcement of special rules for the whole of the potting trades throughout; and as regards Great Britain, the Factory Department Draft Regulations (a copy of which has been furnished to me, for consideration, in view of my writing this paper) comprises such a voluminous document as to provide ample occupation for at least one very competent person in a factory without intermission.

If the paint and painting industry is to be favoured with a pamphlet of no less than 23 pages, consisting of regulations, the observance of which is compulsory, I venture to express an opinion that zinc paints will forthwith be held up to unqualified admiration by some of the very same persons who consider to-day that lead paints are absolutely indispensable.

The National Federation of Building Trades Employers of Great Britain and Ireland are a body of Centres and County Federations. The Midland Centre publish a Year-Book at their office in New Street, Birmingham. Representatives meet on an Executive Council from Birmingham and towns in the surrounding district as far distant as Derby, Leicester, Newark, Nottingham, Worcester, &c., some twenty cities and towns. This Executive Council recently memorialised H.M. Home Office—the Factory Department—that they, the Council of the Midland Counties Master Builders, would recommend and prefer the prohibition of the use of lead compounds in paint rather than restrictions and regulations for the painting industry.

Nevertheless, unless prohibited altogether, the use of white lead and red lead in paint and plumbing, gas and water fitting, must indeed be restricted and regulated by law.

The Organs of the Body Affected by Lead Poisoning.

Lead poisoning of the most serious nature is produced by the repeated absorption into the human body of minute quantities over a lengthened period.

It is a question of elimination failing to keep pace with absorption. Poor food and poverty are predisponents. Females are far more liable to it than men, and this is true of the lower animals. Abstinence from tobacco and alcohol have been proved to lessen the danger of lead poisoning, as also does personal cleanliness. The length of exposure to lead, required to produce the symptoms, has been

known to vary greatly; females have died in England after three months, negroes in America in less time.

Mention should be made of Mr. Kenneth Goadby's experiments with gastric juice, reported in the *Journal of Hygiene*, April, 1909, with the object of determining the degree of danger—namely, by the solubility of the lead compounds in the secretions of the body.

These experiments do not show that lead sulphate is less soluble, but no doubt it does not evolve nearly the amount of toxic fumes when applied in fresh paint.

Channels of Entrance into the Body.

Lead enters by the skin, the lungs, and the alimentary canal. As poisoning takes place through drinking water or beer that has stood in lead pipes or by lead dust dissolved in saliva and swallowed, a series of digestive experiments were made by Professor Bedson and Dr. Best at Armstrong College, Newcastle, for Sir Thomas Oliver.

It appeared from these tests that in the absence of food, lead carbonate soon becomes chloride in the human digest, which is soluble and diffusible. But if food is present the hydro-chloride acid is used up in the conversion of the proteid into acid albumen and peptone, leaving (therefore) the lead unacted upon, which has therefore nothing to prevent its passage from the stomach, along with the chyme, into the intestine, and so it gets eliminated. Recommendations were based on these experiments, that all who use lead should take food before commencing the day's work.

The Danger of Metallic Lead.

In addition to the danger of salts of lead, the presence of the metal itself, such as shots or bullets in the body, has resulted in lead poisoning years after the date of the injury.

The Symptoms and Pathology of Plumbism.

Of these, pallor, sallowness, distaste for food, sickness, constipation, lassitude, restless colic, the Burtonian blue line on the gums, with ulceration, loss of teeth, and in women intense uterine and pelvic pain.

Chronic cases develop persistent severe headache and listlessness.

Pallor in lead workers is accompanied by deficiency in red corpuscles of the blood. Instead of there being five millions per cubic millimetre, there may be but half that number, and Continental observers attach great importance to this proof of plumbism; but one of our greatest British specialists thinks it doubtful evidence, and difficult to detect with certainty. It may occur in other conditions; therefore the surer proof would be the presence of lead in the urine and fæces.

Effect of Lead upon Motherhood.

In 1898 in North Staffordshire, whilst 4.9 per cent. of men employed in lead or dangerous processes suffered from plumbism no less than 12.4 per cent. of women thus employed became ill therefrom.

Twenty-three persons died in a few years in Newcastle-on-Tyne from lead poisoning—22 were women.

Twelve persons died in the Potteries from this cause, of whom 11 were women.

It is almost impossible for a woman who is working in lead to be the mother of a healthy child. If a child is born when it should be, it is badly nourished, and soon dies in convulsions.

But, some time after ceasing lead work, such women have been known to have given birth to healthy living children.

"Lead acts prejudicially upon the offspring, both through the mother and the father, but its harmful influence is, as might be expected, greater through the mother. When both parents have been lead-workers, the power for harm is then greatest."

The more, by his occupation, a man is exposed to lead, the more harmful are the effects upon his progeny.

Amongst those who furnish the largest number of reproductive failures are painters and plumbers, printers, and, formerly, pottery dippers.

Of the children of paint grinders, an eminent medical authority found that 40 per cent. die of convulsions during the first year of life.

Professor Lewin, a French medical man, showed in a tabulated record that seven women married to men working in lead bore only two living children; but that had their husbands not worked in lead, the number of children born to them would in all human probability have been 32.

I again draw attention to Sir T. Oliver's recent address on "Lead Poisoning and the Race," printed in the *British Medical Journal*, No. 2,628.

Dr. Prendergast, of Hanley, also testifies that the children born to lead-poisoned parents, who survive infancy, are of

inferior physique, are handicapped in their start in life, and subsequently exhibit symptoms of mental and physical deterioration, or both.

Pathology.

Long exposure to lead injuriously affects the organs of elimination, and there is excess of albumen in the urine. After a time the lead poison gets stored in the system, and then favours the retention within the body of poisons generated by the individual himself.

Sometimes lead is found in the brain and cerebellum. In females there may be hysteria, though not a frequent symptom of lead poisoning, yet often a precursor of speedy death.

Loss of vision and hearing follows on severe headaches or convulsions, either lifelong or only temporarily.

Amongst 130 persons exposed to lead, and whose eyesight had become injured, 34 were painters and 20 were white-lead workers, according to Professor Lewin. In the Newcastle Infirmary 114 persons were affected; 40 did recover their sight, 22 partially, 36 became blind, and 16 died prematurely.

Claims under the Workmen's Compensation Act are liable to become lengthened, because lead is retained within the body for abnormally long periods of time. Even after ceasing to work in lead for sixteen months abdominal pains and sickness recurs, and lead has been found in evacuations.

Sometimes elimination of lead may cease for many years. A patient suffered from colic, mania, and blindness, but recovered. Subsequently she bore six children, of whom five survived, and she was several times laid aside ill.

Seventeen years after leaving the lead work, an attack of saturnine poisoning recurred, proved by the presence of lead in the urine.

Some chemical change in her system had dissolved the lead that had lain dormant or inert, and this, entering the circulation, produced fresh symptoms of lead poisoning.

A labourer, aged 41, had suffered from paralysis, wrist-drop, &c., eighteen years previously. Some potassium iodide was given him, and this was followed by considerable elimination of lead in the urine and recurrence of other symptoms of lead poisoning.

Wrist-drop was traced to plumbism many years ago by French physicians. It is accompanied by wasting of muscles. Sometimes death occurs by paralysis of the respiratory muscular system.

The left-hand muscles being subject to most fatigue in file cutters, consequent on tight grip of the chisel, they suffer more in that hand and wrist. Dr. Ludwig Teleky, of Vienna, has written an account of his studying this question after closely watching forty cases of lead paralysis.

Many instances of ankle-drop have also occurred in persons who used lead.

Plumbism and Gout.

Sir Alfred Garrod found that 33 per cent. of his gouty patients were lead poisoned.

Sir Dyce Duckworth certified that 18 per cent. out of his 136 patients in gout had been more or less affected by lead intoxication. But even though there be no constant relationship between the two maladies, yet, probably, the elimination of uric acid and lead is inversely related the one to the other.

In health, 6 to 7 grains of uric acid are thrown off daily by the kidneys; in lead patients the amounts eliminated varied from 12 to 21 grains, without any signs or symptoms of gout. But this was on Tyneside where gout is infrequent.

Death Caused by Lead Poisoning.

Absolute evidence is obtainable by finding lead in the internal organs.

A woman had worked in lead two and a half years. The distribution of lead in the internal organs of this person, and of two others, was tabulated by Professor Bedson and printed in the "Dictionary of Applied Chemistry" (Thorpe's), Vol. II., page 445. Expressed as metallic lead in parts per million, as much as 24 parts were found in the intestines, 15.5 in the kidney, 14.7 in spleen, 47.7 in liver, and nearly 150 parts per million in the brain, cerebellum, and pons.

Sir William Gowers mentions five grains of lead as being found in a human brain.

It is in the marrow of bones that red-blood cells are formed. German observers have found lead in both the bones and the marrow.

Dr. Hume, of Newcastle, attended a plumber, aged 35, in the Royal Victoria Infirmary. This patient became unconscious and died. The general appearances were those of a healthy person. It would not have been possible to diagnose

the cause of death, had not the pathologist examined and found lead in the internal organs, viz., brain, bladder, kidney, and spleen.

Effect of Occupation on the Form which Lead Poisoning Assumes.

This depends on whether the occupation be indoor or outdoor work. Also, inhalation of fumes or of dust of lead. Inhalation of dust or fumes of salts of lead—that is, oxide, carbonate, sulphide, sulphate, &c.

Apparently, working with metallic lead produces severe paralysis; whereas working with salts of lead involves colic or brain disease of great severity. Women are twice as susceptible to lead mania as men.

When is a Workman Really Suffering from Plumbism?

A greenish-blue line on the gums is also observed in copper workers, so it is not an infallible sign. Nor is the deterioration of the red blood corpuscles.

But the presence of lead in the urine is good evidence. Professor Bedson analysed the urine passed by 23 male lead workers—in the morning—before commencing work; also of three paint grinders in another factory. The lead found varied from 0.40 to 2.40 per million parts. In one man, who had worked in lead (both red and white lead) 33 years, was found the most, there being 2.75 parts per million in his case.

These traces of lead are found long after the patient has retired from lead working, especially after the administration of iodide of potassium. But none of the 23 men, the analysis of whose urine was recorded, complained of ill-health. But had one of them been suffering from colic or weakness of the muscles, and exhibited a blue line on his gums, then the detection of lead in the urine would have been almost conclusive evidence of plumbism. The malady may be latent, but awaiting the fall of a spark to light up an explosion, for lead in the bladder means lead in the other organs of the body.

None of the 23 lead workers above referred to may die of lead poisoning, but all of them would have their recovery from any incidental illness retarded by the lead in their system. There are, therefore, two forms of lead poisoning, actual and potential. There is actual plumbism (with its symptoms), and potential plumbism, awaiting an alteration of the internal chemistry before symptoms can be lit up.

Is the potential form of plumbism to be regarded as a disease under the Workmen's Compensation Act? It may never become actual. Yet, all the same, pathological changes are silently taking place within the body; the consequences of which may be even more disastrous, ultimately, than were the malady to have revealed itself earlier, by symptoms, and have been treated.

Of course there may be other metals present in the urine, and when a claim for compensation is advanced, these should be looked for, before the pathologist can say definitely that lead is the only cause of the trouble.

Lead poisoning in relation to the British Workmen's Compensation Act of 1906 is a subject too varied in its scope to deal with in this paper.

The treatment of lead poisoning, both preventive and curative, is also not within the scope of anyone except a qualified medical man; unless, perhaps, to refer to the importance of cleanliness, and loyal adherence to the observance of regulations drawn up by H.M. Medical Inspectors—such as the use of soap, respirators, and exhaust ventilation in factories.

But I do consider that medical examination is most desirable in the paint and painting trades.

In Milan, a clinical institute has been opened for the study of industrial diseases. And a Museum of Social Service has been founded in Budapest, where old and dangerous processes can be contrasted with modern and healthier ones, and lectures delivered, upon occupation diseases, to the industrial classes.

A similar museum exists in Amsterdam.

Dr. Kaup says that in 1908 Prussian workpeople spent 21,000 days in hospital, and during five years no less than 122,000 days. But at least three and a half times as many persons suffer from plumbism at home who do not enter hospitals; so that in Prussia alone, in five years, the time spent in hospitals by workpeople suffering from lead poison, amounted to about 1,170 years.

What appalling mortality and suffering and injury to the nation, and its advancement, must this pernicious racial poison be causing.

Our Government might easily buy up and put an end to the whole production, and forbid the importation of red

and white lead, rather than suffer this state of things to continue.

It is vested interests that block the reformers' pathway; in fact, self in one or another shape and form. Let us seek to live a little more for others.

(To be continued.)

COUNTRY HOUSE ALTERATIONS WITHOUT AN ARCHITECT.

MR. H. W. VEREY, High Court Official Referee, concluded on July 2 a hearing lasting twelve days of an action brought by Messrs. John Thompson & Co., builders and contractors, of Wood Street, Peterborough, against Mr. George Thompson, of Sutton Marsh, Long Sutton, for the recovery of the balance of an account for alterations and additions to Wryde House, Thorney, Peterborough. The parties were not related. This house, standing on the borders of Lincolnshire, was acquired by the defendant as a residence for his daughter, who in the spring of 1911 was married to Mr. H. S. Dixon-Spain, land agent to the Earl of Leicester. Built in 1862, the place had been a farmhouse. Mr. Compston, counsel for the plaintiffs, stated that no architect had been employed on the job from beginning to end and, save for a rough plan, no plans were ever prepared but by the plaintiffs, who, therefore, had had to be their own architects as well as contractors. The work, according to counsel and the witnesses he called for the plaintiffs, was of such a character that no complete specification could ever be made.

Mr. Herbert Smith, counsel for the defendant, called evidence to allege that the charges were unreasonable and excessive. Mr. Compston suggested in cross-examination to defendant's witnesses that these prices were reasonable in that the defendant would have had to pay them if an architect had been employed in connection with what counsel described as the conversion of an ugly building into a pretty villa.

Witnesses on behalf of the defendant's case included Mr. John Edwin Dixon-Spain, architect, brother of the defendant's son-in-law, and practising at 19 Hanover Square. He stated that when he was first consulted in this dispute he was anxious that the affair should be settled with as little friction as possible between the parties; but the plaintiffs, when he communicated with them, said they could not give any further information than was contained in their account, but they offered him access to their books. There were two methods of arriving at a fair conclusion as to a fit charge for the work. The first was to make a personal inspection of the premises and to form a mental estimate of what one considered a fair amount to charge for the work. The other method was to send a quantity surveyor to measure up and price the work. Anxious that the matter should be settled, the witness took the first course and visited Wryde. The work was fully described to him by his brother, who knew all about it, and the witness came to the conclusion that £1,200 would be ample remuneration for the work done. His pronouncement, however, not having been accepted by plaintiffs, witness sent a quantity surveyor, a Mr. Venning, to measure and price the work. Mr. Dixon-Spain added that he had considerable experience of the alteration of old houses, and he was of opinion that the work at Wryde did not offer any unusual difficulties.

In answer to other questions the witness said it was not usual for architects to take measurements. They only made notes upon which to form judgments. If measurements were necessary, they sent for quantity surveyors.

Mr. Dixon-Spain, in cross-examination by Mr. Compston, stated that he had been in practice for himself for about ten years. His brother had given him all the information he required in order to enable him to estimate the value of the work.

Was it not necessary for somebody to give you information about the hidden work?—Not at all. I had all the information I needed, and even if I had had no information at all, it would not have been difficult for me to arrive, as an architect, at a fairly accurate estimate of what the work was. Continuing, he said that he had taken into consideration everything which had been brought to his notice or which he had noticed himself. He had not borne in mind the alleged rebuilding of a gable end, because, to be frank, he did not think it had been rebuilt. If witnesses for the plaintiffs, however, stated that it was rebuilt he would accept the statement, as it was comparatively a trivial matter.

Mr. Harry Selwyn Dixon-Spain, son-in-law of the defendant, also gave evidence. In cross-examination by Mr. Compston, the witness said he supposed he had intended the plaintiffs to be architects as well as builders so far as architectural work was necessary. He acknowledged that he had intimated that as the old tenant of the house was still in occupation, there could be no specifications, and, therefore, no contract.

Mr. Compston: Therefore you knew that you would have to pay for labour and materials?—Yes, I suppose so, in reason.

Asked if, as there was no architect employed, he did not expect to have to pay for architectural work and advice, the witness replied in the negative. He had expected that it would be taken into account in the ordinary allowance for profit.

Sir A. Brumwell Thomas, F.R.I.B.A., carrying on business at 37 Old Queen Street, Westminster, stated that he had visited this house, for the purpose of giving evidence, in company with Mr. Venning, a surveyor, with whom he went through the bill of quantities. If anything, witness should say that the price of the work assessed by Mr. Venning on behalf of the defendant was a high one.

Asked to point out what the difference would be like between a contract job and a day-by-day job, Sir Brumwell replied that as regarded materials there should be no difference. Regarding the labour element, he said that if each workman wasted an hour and did not exert himself each day, the cost of labour would be affected 10 per cent. roughly. It would affect the whole job by 5 per cent.

Mr. Herbert Smith: What do you say with regard to the necessity of a foreman on the job?—Quite necessary. There ought to be a general foreman who should give his whole time.

Mr. Smith: Plaintiffs' witnesses have said that if this had been a contract job they agree there ought to have been a foreman, but as this was a day-by-day job there was no necessity for one. What do you say?—That has nothing whatever to do with it. A foreman is as necessary in a day-by-day job, in fairness to the employer and the employed. Answering other questions, the witness said he did not see why this work could not have been done in five weeks. Control and organisation, in his opinion, would be the secret of getting this work performed with due expedition. He rejected the proposition that to do this job in five weeks would be a tremendous hurry and drive. In his opinion, Mr. Venning had been quite able to measure and value the work, having regard to a plan he had had, showing what was intended to be done in the case.

In answer to Mr. Compston, Sir Brumwell said that extra works ordered by the clients, including a marble staircase, were responsible for the difference between the final and contract price in respect to Belfast City Hall, for the designing of which the witness was responsible.

Answering another question by Mr. Compston, Sir Brumwell Thomas said that he had not, previous to this case, been called into a case in which he had not been concerned as architect, and there had been no architect.

Mr. Compston: I understand you to say that when once you have settled your measurements your prices would not vary more than 10 per cent. between the two independent surveyors?—That would be a reasonable presumption.

Witness, in re-examination, stated that the majority of the drawings in this case were setting-out drawings which would be included in the ordinary work.

Mr. Smith: Would plaintiffs be entitled to charge extra for them?—I think not. Answering counsel, Sir Brumwell humorously remarked that he had learnt a good deal about construction in this case.

Addressing the Official Referee at the close of the evidence, Mr. Herbert Smith said that his client, Mr. Thompson, had tried to find out what work had been done by the plaintiffs and what he ought to pay them. He had called in the very best expert evidence he could get in London, and professional gentlemen had gone down, at frightful expense to him, to the house. Having investigated everything, they had advised him that a sum of £1,230 was an outside figure and would not suggest that he should pay a penny more. Defendant had, however, for the sake of peace offered £1,400 to the plaintiffs to get rid of this costly litigation. Plaintiffs, however, would have their "last ounce of flesh" out of this unfortunate man.

Mr. Compston, replying on behalf of the plaintiffs, said that his clients were a firm of very high repute and he resented the assertion that his clients sought to extract the

"last ounce of flesh." He also protested against other attacks which had been made against his clients and some of their witnesses. The plaintiffs identified themselves with their men, who had been with them for many years and in whom they had the utmost confidence, and they did not and would not believe that these men, whom they trusted, had been putting down time that had not been worked. The defendant had not desired to have an architect or a clerk of the works; yet the plaintiffs had been attacked unmercifully. It was hard on them that they should be compelled to undertake the duties of an architect in this case and, if the defendant could have his way, without remuneration, and then to have their designs and construction attacked. Counsel reminded the Official Referee that his clients had been entrusted with cathedral restoration work of the highest class. Counsel submitted that the calculations of the time occupied were more or less guesswork on the part of the defendant's representatives, and based on estimates that had not been verified and which might either be accurate or very inaccurate. Counsel submitted that in the circumstances of this case the prime cost basis was the only possible basis. He invited the Official Referee to say that, having heard the witnesses, he was satisfied that the times charged for and worked were accurate, and that plaintiffs were entitled to the full amount of their claim—£1,741.

The Official Referee, in giving judgment, said there was nothing in the whole case to lead him to think that the plaintiffs had the slightest intention to overcharge or to deceive. They were a firm of very high repute, and it was admitted that this work was a good class of work. Witnesses on behalf of the defendant, however, had testified that they had measured and valued the work, and he did not see how he could disregard their evidence, unless he thought they had said what was not true, which he could not think. He found as a fact that the £1,400 paid into Court by the defendant was sufficient to satisfy plaintiffs' claim, and he must, therefore, give judgment for the defendant with costs, after deducting therefrom plaintiffs' costs up to the time of the payment into Court.

ART A LA CONNARD AT THE LEICESTER GALLERIES.

In entering upon a criticism of the works of Mr. Philip Connard, it may be permissible to refer to the somewhat inflated prefatory notes, accompanying the catalogue of the Exhibition. Mr. Oliver Onions has obviously a right to his opinions; but is he well-advised to have such very antediluvian opinions on the subject of the "fundamentals"? We read that Mr. Connard's "greatest strength is his single reliance on the first function of the eye, which is seeing what is placed before it," and we are further told that "this strength is so great, that he can afford to dispense with well nigh everything else."

Truly Mr. Connard dispenses with well nigh everything else, and (to our mind) also with "seeing what is placed before" the eye. Consider No. 17, "Morning"; are we really to believe that either of these females is "what is placed before" Mr. Connard's eye? If so, let us pity the eye so afflicted and also pity the artist who cannot find more attractive models, a criticism that applies throughout, by-the-bye. It is not with genre work as with portraiture, for whereas the latter should give faithful presentments, in genre works the artist should idealise an indifferent model, except where idealisation would destroy the character of the story.

We observe that elsewhere Mr. Onions remarks that Mr. Connard's "processes are uppermost and the outward appearance of things must be painfully sought for, if not missed altogether." And, ah! how painfully we sought; and, ah! how we missed! Further, we are told that "the Exhibition must speak for itself"; speak? why, it shouts for itself; look at "The Supper," "The Marionettes," and others!

The conclusion of Mr. Onions' whole matter is that "Mr. Connard is no *Futuriste*. Above everything else he is an *Aujourdhuiste*." Let us thank Heaven fasting, that he is an *Aujourdhuiste*, if by this we may gather that such Art will survive to-day.

But be it understood that whilst thus we are in all honesty obliged to animadvert so strongly upon this *Aujourdhuiste*, there is good work in the Exhibition, and there are also good ideas in evidence. For our artist can paint sunny effects and breadth of foliage, and he can and does paint flowers with a breadth and a vitality that leave nothing to

be desired. See, in support of this, "Flowers of Spring," "Flower Group," "Still Life" (18), "Still Life" (13), and "Flowers and Fruit," but the fruit in the last two is not satisfactory.

So, too, can Mr. Connard paint textile fabrics well, as in "The Lilac Gown," "The Toilet," and "Morning."

In "A Backwater" we are confronted by the best landscape on exhibition; this is one of the few really passable pictures; there is composition, good massing, good object-reflections and living interest.

But what shall we say of such works as "Femme nue" and "The Model," except that the latter is posed well and its general colour-scheme is pleasing; but the drawing, the light and shade, the modelling of these and other works not mentioned! Ah, let us pass beyond the veil outwards, once more to refresh our eyes with the animated and artistic work of Lady Butler, not yet removed from the Leicester Galleries.

HISTORICAL BUILDINGS IN WESTMORLAND.

THE members of the Westmorland County Council have received a report prepared by Mr. J. F. Curwen, F.S.A., on behalf of himself and Mr. W. G. Collingwood, F.S.A., and Professor Haverfield, F.S.A., on the ancient buildings, earth-works, and other monuments of antiquity in the county. The writers point out that the schedule is quite tentative, but a thorough archaeological survey is in progress. The Committee continue:—

"We would ask you not to deem any item as unworthy of protection because it is little known or scarcely visible to the eye. Forming as they do landmarks of topography and history, each one contributes to our knowledge of Westmorland, and, however doubtful some may be, until further explored, they are all the more worthy of care because they have not yet told their story. We have desired to schedule mediæval grave slabs and also sculptured fragments at present sheltered in the churches. At first sight this may appear unnecessary, but sculptured stones are protected in the Scottish churches, and without this there is nothing to prevent any incumbent from turning such relics out of doors.

"It is also hoped that the schedule will be of considerable use to your Council in the working of the present 'permissive' Acts, by which the county councils have power to become the guardians of any ancient or historic monument that an owner cares to hand over to them, and to spend money on its preservation. So far there is no compulsion, and it is only possible for the Councils energetically to invite the attention of owners to the real scope and intention of the Acts. But there is a bill now before Parliament so to extend them as to make them compulsory, under certain conditions, to secure that historic monuments shall be preserved both from wilful destruction and negligible decay.

"However careful the present owners may be, it does not follow that the monuments will not, at some time, pass into the hands of those who have no interest in them, and the fact is indisputable that each year numbers of earth-works are destroyed, and, by gradual splitting, masonry falls to the ground. For example, the keep of Brough Castle is bound to collapse before long unless attended to, and Arncliffe Tower is in considerable danger."

The following are among the more important parts of the schedule:—

Abbeys, &c.

Shap Abbey.—Premonstratensian, founded by Thomas de Wyrkington, 1191, and dedicated to St. Mary Magdalene; St. Mary's Chapel, Askham Hall, dating from time of Henry IV., now used as a dairy.

Bridges.

Nether Bridge, Kendal, grant of pontage for its repair made in 1376; Devil's Bridge, Kirkby Lonsdale, grant of pontage made in 1275; Levens Bridge.

Castles of the Norman Period.

Appleby, 1174; Brough-under-Stainmore, 1170; Brougham, 1220; Kendal, 1184; Pendragon, 1180.

Crosses and Carved Stone Monuments.

Those of the pre-Norman period—from the eighth to the eleventh century—comprise twenty items, including hog-back built in St. Michael's Church, Appleby; the Round Devil shaft, a shaft at Redman House, and a fragment on Mr. J. Harrison's house, all at Kirkby Stephen. Post-Conquest crosses and monuments include the two market crosses at Appleby, market cross at Ambleside; boundary

cross at Bampton School from Knipe Scar; Norman knights at Bolton Church, the Cauld Stean at Kendal, market cross with foot shackle rings at Milnthorpe, and portions of crosses at Cliburn, Brougham, Kirkby Stephen, Lowther, Milburn, Newbiggin on Eden, Ormside, Warcop, and Ravenstonedale.

Fortresses and Earthworks.

Under this heading there is a very long list of nearly a hundred places. They include Castle Crag, Mardale, Castlesteads on Helm, Kendal; and Croglin Castle, Kirkby Stephen; Castle Hill, Dallam Tower, Castlesteads, Lowther, King Arthur's Round Table and Maybrough, Eamont (both now protected), Loscars and Moorland Head, on Newbiggin Moor; Maiden Hold, Bongate, and Coupland Beck, Warcop.

Holy Wells.

There are ten holy or historic wells in the list, at Asby, Bampton, Brougham, Clifton, Kirkby Stephen, Newbiggin-on-Lune, Patterdale, Smardale, Witherslack, and Casterton.

Pele Towers and Megaliths.

There are fifteen pele towers scheduled, all now uninhabited, including Clifton, Lammerside, and Wharton. Of megaliths there are stone circles on Lowther Scar and Knipe Scar, the remains of the great circles and avenues represented by the Goggleby stone and various thunderstones at Shap, and various kinds of megaliths at Clifton, Crosby Ravensworth, Raisbeck, Cliburn, Eamont, Adlendale, Gunnerkeld, Tebay, and High Street.

Roman Monuments.

This section includes the permanent fort still visible near the Castle at Brougham; the camp at Brough-under-Stainmore; Redlands Camp, Crackenthorpe; the fort at Whelp, Kirkbythore; forts at Low Borrow Bridge, a little to the south of Tebay; Maiden Castle, Stainmore Common; Borrans Ring, Ambleside; and Watercrook, Kendal.

COMPETITION NEWS.

COLWALL.—In a recent limited competition for the sewage disposal of Colwall, near Malvern, the scheme submitted by Messrs. Taylor & Wallin, of Newcastle and Birmingham, has been premiated, and the firm engaged as engineers for the execution of the scheme. The disposal works will be on modern bacterial lines of the most up-to-date description.

DUNFERMLINE.—Fifty-four competitive designs for the proposed Netherdown Institute for the Carnegie Dunfermline Trust were submitted. The trustees have decided to accept that of Mr. James Lindsay, A.R.I.B.A., 248 West George Street, Glasgow, for the erection of the building. Mr. Auldjo Jamieson (of Messrs. Sidney, Mitchell & Wilson, architects, Edinburgh), who acted as assessor, has awarded the premiums offered to the following:—First premium (£20) to Messrs. Williamson & Reid, 6 High Street, Inverkeithing; second premium (£15) to Mr. James D. Cairns, 63 George Street, Edinburgh; third premium (£10) to Messrs. Walgate & Clough, 13 Lamond Road, Chelsea, S.W. It is estimated that £7,300 will be required to complete the building in accordance with the accepted plans.

HULL.—Mr. E. Cooper, F.R.I.B.A., of Gray's Inn Square, London, the assessor of the designs submitted for the "Homes of Rest" to be erected in Pickering Road, has made the following awards:—First, Mr. H. T. Hare, of London; second, Messrs. W. S. Walker & Sons, of Hull. The work is estimated to cost between £25,000 and £30,000.

LONDON.—The committee of the Mural Painting Exhibition at Crosby Hall announce the following further results for the competitions:—Church of St. Jude-on-the-Hill, No. 21, Miss Mabel Esplin; and Sutton Valence School, No. 85, George Haghe Day. The names of the other prize-winners were given in our issue of June 21.

MOTHERWELL.—The Dalziel School Board will proceed with the erection of a high school off Hamilton Road, and have appointed Dr. J. J. Burnet, A.R.S.A., F.R.I.B.A., Glasgow, assessor. Plans are to be invited from local architects and from a few of the best known in Glasgow and Edinburgh. Premiums of £50, £30, and £20 are to be offered.

OLDHAM.—Mrs. Councillor Lees, of Oldham, has offered prizes of £100, £50, and £25 for designs for a housing and town-planning scheme. The Housing and Town-planning Committee have decided to allow until October 31 for plans to be sent in.

SHEFFIELD.—In the competition for the new Dore and Totley Union Church, the assessor, Mr. Norman M. Doncaster, has made the following award:—First, Messrs. Chapman & Jenkinson, Sheffield; second, Messrs. Gibbs, Flockton & Teather, Sheffield. The building is to be proceeded with at once, under the direction of the architects placed first.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The New R.I.B.A. Council.

SIR.—I am very glad to notice the letter in your last issue of "R.I.B.A." I presume from the letter that the writer is neither a Fellow nor an Associate, but one of those gentlemen who has the proud privilege of placing the word Licentiate before the magic letters. Well, Sir, I am without the fold, but nevertheless I have always taken a certain amount of interest in the doings of our Royal Institute, and have most regretfully noted its shortcomings. Having taken, as I state, an interest in its proceedings, I have, of course, been compelled to be aware of the name of Mr. E. T. Hall, one of the most regular attendants, I believe, at the meetings. I have attended more than one meeting as a guest, and I can remember the feeling that always impressed me, that he was essentially a strong man, a man with convictions which he was not afraid to express, and I most heartily endorse the remarks of "R.I.B.A." that it is a pity that such services should be lost to the Council. I am not complaining of the gentlemen who have secured "the seats of the mighty"; they are, I believe, "good men and true," even if I am not fully in sympathy with their exclusive views.—Yours truly,

OUTSIDE THE CAMP.

SIR.—I was much interested to read in the present issue of your paper a letter signed "R.I.B.A." respecting the new Council. I may say that I have read both bye-laws 27 and 35, and may express my frank disapproval of the method of allowing a 50 per cent. drain off the Council before re-charging the system. The customary and desirable method is by co-option on the part of the remaining Councillors as each vacancy occurs.

Still, Sir, were it not invidious to do so, I could suggest that half of the present Council might well retire, to give Mr. Hall a renewed chance, if he would consent to re-nomination. Need I add, Sir, that from that percentage I omit your name, as I should deeply regret your absence from the Council.—Faithfully yours, Also R.I.B.A.

BOOKS RECEIVED.

"Building Structures in Earthquake Countries." By Ing. Alfredo Montel. Translated from the Italian, with additions by the Author. With forty-two Diagrams in the Text and one Plate.

Monday, July 15.

Royal Society of Antiquaries of Ireland : Munster Meeting at Waterford and excursions (six days).

Wednesday, July 17.

Northern Architectural Association : Annual Excursion.

THE HISTORY OF ARCHITECTURE IN INDIA.

THE history of architecture in India may be said to commence with the reign of Asoka from about B.C. 265 to 228, at which time Buddhism became a State religion, and appears to have reigned almost supreme in India, although there is no reason for believing that the Vedic religion or Brahmanism then vanished. Mr. Fergusson, in his "History of Indian and Eastern Architecture,"* tells us that "During four or five centuries after the Asoka era we have not a trace of a Hindu building or cave, and, so far as any material evidence goes, it seems that Buddhism at the time was the predominant religion of the land. It is not, of course, to be supposed that the Hindu cult was wholly obliterated, but it was dormant and in abeyance." It is not to be assumed that there was no architecture in India before the days of Asoka, but it was a timber architecture, of which the remains and records have vanished, so that as the earliest political and ethnographic history of India is, for want of records, obscured in a haze of overlaid traditions, so the architectural history commences with the stone buildings first constructed during the Buddhist supremacy.

The various objects of Buddhist art are classed by Mr. Fergusson under five groups—(1) Stambhas or Lāts, pillars common to all the styles of Indian architecture; (2) Stūpas or Topes, dome-like monuments containing relics of Buddha or of some Buddhist saint, or erected to commemorate some event or mark some sacred spot dear to the followers of Buddha; (3) Rails, one of the most important features of Buddhist architecture; (4) Chaityas or Assembly Halls, corresponding very nearly to the churches of the Christian religion; (5) Vihāras or monasteries.

In common with other objects of Buddhist architecture, it is at least probable that the lāts took their form from a wooden original, although there is evidence in the decoration of some of the earlier ones of Assyrian influence. Of Buddhist topes the most extensive group now remaining is at Bhilsa, on the north border of Bhopal, but in all probability there were many other groups of even greater importance, as there are said to have been 84,000 topes erected by Asoka. The rails of Buddhist architecture which, as at Sanchi, were sometimes extended into great gateways, were usually the occasion for much sculpture, sometimes expressive of tree and serpent worship, at

others representing scenes from the career of Buddha or of contemporary life. The chaitya halls are mostly represented by rock-cut buildings, but a few structural examples remain sufficient to prove that what is carved on the rock-fronts of the cave buildings was a replica of the form of those constructed in the open. The chaitya seems to have been usually apsidal ended on plan, frequently with aisles and pillars, and to have been roofed with a circular timber roof or brick vault covered with plaster. The vihāras or monasteries were in Buddhist architecture, like the chaityas, either independent structures or rock-cut dwellings, and the appearance of the former may be gathered from the description of the Chinese traveller Hiuen Tsiang in the seventh century, quoted by Mr. Fergusson. "In the different courts the houses of the monks were each four storeys in height. The pavilions had pillars ornamented with dragons, and had beams resplendent with all the colours of the rainbow—rafters richly carved, columns ornamented with jade, painted red and richly chiselled, and balustrades of carved open work. The lintels of the doors were decorated with elegance, and the roofs covered with glazed tiles of brilliant colours, which multiplied themselves by reflection and varied the effect at every moment in a thousand manners." The rock-cut vihāras seem to have usually consisted in plan of a more or less rectangular pillared hall, surrounded by cells and with a verandah in front. Sometimes there was a distinct shrine or enlarged cell as a sanctuary or chapel.

An interesting section of Mr. Fergusson's history is the section on architecture in the Himalayas, where in the valley of Kashmir exists a complete and homogeneous group of temples extending through about five centuries (A.D. 600 to A.D. 1100), singularly uniform in their development and very local, being unlike any other style known in India, and having besides an impress of Western civilisation in quasi-Grecian forms reminiscent of the Doric, Ionic and Corinthian orders. In Nepal the remains of Buddhist architecture are for the most part more modern than in Kashmir and tinted by Tibetan and Chinese influence.

Hindu architecture Mr. Fergusson divides into three styles—Dravidian in Southern India, Chalukyan in the Central Provinces and Indo-Aryan in the north. An outstanding feature of Hindu architecture is the preponderating use of the horizontal or corbelled arch and of the bracket. One of the consequences of this mode of construction was that all the decoration of the Indian domes was horizontal, or, in other words, the ornaments were arranged in concentric rings, one above the other, instead of being disposed in vertical ribs as in the Roman or Gothic vaults. Another result was the tendency of the

* *History of Indian and Eastern Architecture.* By the late James Fergusson, C.I.E., D.C.L., LL.D., F.R.S., F.R.I.B.A., Member of the Society of Dilettanti, &c., &c. Revised and edited, with additions. "Indian Architecture," by James Burgess, C.I.E., LL.D., F.R.S.E., &c., &c., and "Eastern Architecture," by R. Phené Spiers, F.S.A., F.R.I.B.A., &c., &c. With numerous illustrations. In two volumes. (London: John Murray. 42s. net.)

FROM SKETCHES SUBMITTED BY MR. J. R. LEATHART FOR PUGIN STUDENTSHIP, 1912.

temples or monumental buildings to rise to a considerable height in a succession of storeys or bands gradually diminishing to the crown or apex.

Dravidian architecture is practically that of the Madras Presidency or the country inhabited by people speaking Tamil or cognate tongues, who, thinks Mr. Fergusson, are descendants of aboriginal races of India. Until they came in contact with the Muhammadans all the architectural efforts of the Dravidians were devoted to the service of religion; their civil buildings, therefore, are in a new and different style of architecture from that employed in the temples, and are in what we may call a pointed-arched Moorish style, with the whole of the ornamentation worked out in exquisitely fine stucco.

The Chalukyan style was naturally evolved from the Dravidian, and although most of the earlier and the finer examples of its architecture perished during the early Moslim invasions, is neither the least extensive nor the least beautiful. Elegance of outline and marvellous elaboration of detail, with marked horizontality of receding storeys, are prominent features of Chalukyan temples and shrines.

In using the term Indo-Aryan to distinguish the architectural style of the Hindus of Northern India, Mr. Fergusson is careful to explain that he does not thereby imply Aryan characteristics or influence, but as the origin of the Northern Hindu style was to him a mystery, he chose the term as indicative of locality, although wave after wave of incursions of Turanian peoples had during the building ages reduced the people of pure Aryan blood to a very small proportion of the population. The Indo-

Aryan style can be best seen in its purity at Orissa, as far as temple architecture is concerned, but there are a number of extensive and beautiful palaces which, although altered and enlarged at various dates, distinguish in a marked degree the architecture of Northern India from that of the South.

Buddhism and Hinduism do not exhaust the religions of India. We have also that of the Jaina sect, closely resembling the Buddhists, and that of the Muhammadans, both with well-marked architectural characteristics, as to which we must refer our readers to Mr. Fergusson's exhaustive volumes. Enough has been said to show that Indian architecture is an exceedingly complex study; indeed, we find that in Muhammadan or Saracenic architecture alone Mr. Fergusson distinguishes no less than thirteen divisions, each with local peculiarities, and including some of the most noted and beautiful buildings in India. We have also the variants in style to be found in Further India, Burma, Cambodia, Siam and Java, so that it is easy to understand there are many architectures in India, and that a thorough comprehension of the art there manifested is no easy matter.

NOTES AND COMMENTS.

THE School of Civic Design at Liverpool University has justified its existence. The annual prize donated by Sir William Lever produces designs from students that are worthy of execution. Last year's winning scheme for Port Sunlight was admirable; this year's successful design for laying out a portion of land bounded by Brownlow Hill, Mount Pleasant, and Bedford Street is

FROM SKETCH SUBMITTED BY MR. C. PEAKE ANDERSON FOR PUGIN STUDENTSHIP, 1912.

even more so. The conception of admirable schemes is, however, but one part and the easiest of town-planning. The estimation of their cost and the proof of their financial possibility is another question and the more crucial. A town-planner to be worth his salt must be a financier, and genius in finance is even more important than imagination in plan.

London University's new home is still in a distant and dubious future. The principal suggestions that have been made are as follows: (1) A site on the vacant land, belonging to the Duke of Bedford, at the back of the new British Museum extension; (2) the Crystal Palace; (3) the Botanical Gardens of Regent's Park; (4) a corner site near the Gray's Inn Road; (5) the site now occupied by the Foundling Hospital in Bloomsbury; (6) a site adjoining the new London County Hall by the Thames at Westminster. Serious objections exist against all except the first and last on the ground of situation, and the first is now practically out of court for reasons of finance. The last, though to our mind a less attractive locale than the first, has nevertheless many points in its favour from the point of view of London town even more than of London University. The town would be benefited by the improvement of the southern side of the Thames, and the University, if not so readily accessible as in Bloomsbury, would at any rate be in the public eye.

The proposal for a National Provincial Art Gallery to be located in London has scarcely, we think, a logical basis. It infers, what is not the fact, that art produced in the provinces has not an equal chance of being exhibited with that produced in the Metropolis, even when it is of equal calibre. On the contrary, the exhibitions held in London, from the Royal Academy downwards, are national, and much of the best work shown in them comes from the provinces. A National Provincial Art

Gallery would inevitably be the receptacle of work that is not good enough to hold its own in the present exhibitions, and to be included therein would soon be taken as a mark of inferiority. The provincial work that is not good enough for the Royal Academy stands a far better chance of appreciation in a provincial show, where local sentiment would be to its faults a little blind.

Mr. Tarrant, of Byfleet, a speculative builder of good-class houses, has recently expressed his view of the practical working of the land taxes in their effect upon the building industry. He says that the land taxes took from him the opportunity of using thousands of pounds on terms much more favourable than anything he was able to arrange now, because the land taxes have reduced the security of land. It is the loss of this security which has reduced the price of land and buildings erected thereon. The fact that land and buildings have lost some of their security justifies and enables capitalists, &c., to ask a higher rate of interest for their cash than they either asked or were able to get when they held a perfect security. This increased rate of interest not only affects the person who builds houses, but it affects all those allied trades which produce the builders' materials. All those industries either have to have large tracts of land, like brickmakers' works, or large workshops, such as paint or joinery factories. There are very few traders but either have a mortgage on their premises or occasionally deposit their deeds with their bankers, so that almost every trader has to pay higher interest charges now than he had. So it comes about that the blow to security which has cheapened the building land has raised the price of the materials which the builder uses, and has raised the price of the food and clothes necessary to enable the workman to live. He says that he has carefully worked out the figures connected with one of his average houses, value about £3,000, and finds that since

the Budget he can get the land for this sized house at about £150 less; but materials cost him at least £175 more, solicitors' costs about £5, stamp duties on sale and mortgage £22, interest during building £20, and valuations average £4 more, so that his finished building costs £226 more than it did against a saving of £150 on the land. But the most serious factor is that the increased interest does not stop when the building is finished, but goes on, and is likely to get still higher, so that the house is saddled with an increased annual expenditure of something like £15 to £20.

An interesting article appears in *The Connoisseur* this month on Lincoln's Inn and its Treasures, in which the old buildings as well as some of their more curious and valuable contents are described and illustrated, which include works appertaining to architecture and other arts. Other articles in this month's issue deal with the current exhibition of miniatures at Brussels, old Staffordshire pottery figures and old lacquer, with special reference to Chinese work.

The British Fire Prevention Committee announce that to meet suggestions from several foreign Government Departments and other public authorities abroad who are desirous of following the results of the Committee's research work—but frequently have to contend with linguistic difficulties—a supplementary summary in the German language is being added to the Committee's publications. We do not propose to reprint these translations, but are pleased to know that our British work is appreciated to such an extent as to make them desirable. We understand that translations into the French language will shortly follow.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE have received but few drawings of sundials, which appears to form a subject that is rather outside the usual range of our students' work, but these adjuncts are often the objective of excellent craftsmanship and design, and besides furnish points of interest in a building or its surroundings. The drawings we have received are, however, though few in number admirable in quality.

"Alpha" has illustrated three examples of sundials, one a detached pedestal dial in the garden of the vicarage at Ryton-on-Tyne, and the others wall-dials at Heriot's Hospital, Edinburgh, and South Church, Bishop Auckland, respectively. The conditions of our competition limit each student to one subject only, and "Alpha" pins his faith to the Heriot's Hospital example for the competition and submits the others *hors concours*. The competitive drawing shows a double dial on two faces inclined at an obtuse angle, an instance of the making of difficulties in which seventeenth and eighteenth century diallers delighted to show their skill. The gnomons are not quite correctly shown in "Alpha's" plan and elevation. It is important in studying dials to get the plan and angle of elevation of the gnomon absolutely correct, as upon these points depend the accuracy of the dial as a time-keeper. The example which "Alpha" illustrates from Bishop Auckland is interesting as bearing a statement on the inscription of "Latitude 54° 49'," the determining factor of the gnomon's angle, any given gnomon being only suitable for a particular latitude. The example from Ryton is a good illustration of the usefulness of a sundial as a motif for a scheme of garden planning.

Mr. Chas. H. Roberts has drawn an interesting dial on three rectangular faces from Wimborne Minster, Dorset, with gnomons on the west and east as well as on the south, another piece of difficulty making. Mr. Roberts has wrongly named his east and west elevations and the lettering of the hour lines on the real west elevation is incorrect. Mr. Roberts' perspective is a good and effective drawing.

Mr. E. H. Gibson has found in a Harrogate curio

shop the sundial which he has measured and sketched. It is in the not uncommon form of a hollow sphere, specimens of which are more usually nowadays to be seen inside buildings, preserved as curiosities rather than fulfilling their appropriate function out of doors. This example is mounted on an enriched and well-designed Portland stone pedestal, and is said to have been removed from Maidenhead. As the latitude of this place and Harrogate differ considerably it would be incorrect at the latter place.

We have awarded a prize of one guinea to Mr. E. H. Gibson and half a guinea each to "Alpha" and Mr. Chas. H. Roberts.

This month's work concludes the competition for *The Architect* Travelling Studentship for 1912, which has been won by Mr. E. H. Gibson, who has contributed regularly throughout the year, and whose work, although not always securing a monthly prize, has been consistently good.

SOME ACETYLENE PLANTS.

FOLLOWING on the series of articles by Professor Vivian B. Lewes on Acetylene Lighting, which appeared in *The Architect* issues of May 31, June 7, 14, 21, and 28, we now give particulars of the apparatus supplied by some of the leading acetylene lighting firms in this country. It will be remembered that Professor Lewes drew a distinction between "automatic" and "non-automatic" generators, the distinction being that the former "have a storage capacity for gas less than the total volume the charge of carbide is capable of yielding, and which will depend upon some mechanical contrivance for stopping contact between the water and the carbide," whilst in non-automatic generators "a holder of sufficient capacity to take the gas given by the full charge of carbide is employed." The distinction in terms is, however, a little likely to confuse, as "non-automatic" generators can be and are, for the purposes of the user, made to work automatically. One may perhaps more clearly understand the essential difference between the two types if we say that the "automatic" generator makes acetylene gas only when there is a demand by the burner, whilst the "non-automatic" makes and stores gas whether there is any immediate consumption or not.

The generator of the Acetylene Corporation, Ltd., is of the "non-automatic" type, but works automatically in that when you have put in the charge of carbide and turned on the water tap the machine does the rest and goes on working till the gas in the whole charge is generated, washed, purified, and stored in the gas-holder and cooled ready for use when required. An important feature in generators, as pointed out by Professor Lewes, is the working pressure; it is stated by the Acetylene Corporation that in their plant there is an internal pressure of five inches water column only, with 2½ inches at the burners. This low pressure makes for purity of the gas produced. The carbide supplied by the Corporation appears to be of high quality capable of a production of 5.38 cubic feet of acetylene per pound, but, as Professor Lewes points out, this is the theoretical maximum for carbide and no generator can be expected to produce without some loss. The Corporation's plant, however, seems to give every promise of a high efficiency.

The plant of the "Bon-Accord" Acetylene Gas Company includes a generator of the "automatic" type, or rather twin generators, which do not work simultaneously, but alternately, by which means some of the defects of the type pointed out by Professor Lewes are obviated. Provision is made for the storage of the gas evolved after the water supply has been shut off, and the generators are surrounded by water jackets having a constant circulation of cool water by connection with the water tank, thereby keeping the temperature as low as possible. By the use of twin generators one can be recharged without interfering with the lights, while the other is supplying gas. The pressure in the apparatus is stated never to

exceed $1\frac{1}{2}$ lb. per square inch, and the yield of acetylene is guaranteed at 90 per cent. of that obtainable from the carbide used. Thus it will be gathered that whilst the advantages of an "automatic" type of generator are maintained, the disadvantages described by Professor Lewes are minimised.

The "Incanto" system of the Thorn and Hoddle Acetylene Company, Ltd., uses a plant with a generator which may be described as a compromise between the "automatic" and "non-automatic" type in that a moving gas-holder is provided, but the flow of water to the carbide is controlled by the demand for gas. Thus provision is made in the apparatus for the storage of gas due to after-generation, and it is stated by Professor Lewes that the "Incanto" generators "work automatically in a perfectly satisfactory manner without any sign of over-heating, whilst the yield of gas is from 95 to 99 per cent. of that possible to be obtained from the carbide used." The objectionable features of "automatic" generators, of which Professor Lewes speaks in his articles, appear therefore to have been overcome in the "Incanto" plant whilst the advantages of the type remain.

It is scarcely necessary to say that in each of the three typical examples of acetylene plant to which we have referred high importance is given to the purification of the gas after generation. Each manufacturing firm has its own favourite special mixture of purifying material. It is fortunate for acetylene that the burning of impure gas is unendurable, as plants must be made to prevent this effect, and so the use of acetylene for lighting results in far less vitiation of the atmosphere than does the burning of coal gas.

THE EFFECT OF WATER PRESSURE IN PREVENTING THE TRANSMISSION OF HEAT FROM STEAM THROUGH SURFACES.*

I HAVE been interested in the question of heat transmission for a great many years, and in making various tests of the apparatus have been somewhat troubled at times to find the cause for variable efficiency, and I came to the conclusion that where head pressure on the water side existed it had to do seriously with the efficiency of the steam pressure on the other side.

In a paper I read before the Manchester Association of Engineers in February 1897, I gave a brief series of tests of the efficiency of steam, varying from 5 to 40 lb. per square inch, which went to show that whilst the thermal unit value of a pound of steam did not vary very much, the efficiency of pressure to transmit itself through surface was a very important point.

It has been the practice in heating water for use in public buildings to use steam of a low pressure, probably through fear of putting too great a tax on the strength of the apparatus employed. This is a false policy, as will be seen by the following table. The heating efficiency of steam goes up in proportion to its pressure, and high-pressure steam means much more compact apparatus.

Table Showing the Efficiency of Heating Surface at various Steam Pressures.

Steam Pressure in lbs. per sq. in.	5	10	15	20	25	30	40
Quantity of water raised from 50° Fah. to 180° Fah. in gallons per square foot of heating surface per hour	35	42	56	62	80	93	103

I recently made a series of tests to substantiate or dismiss this theory, and obtained valuable help from Mr. L. Holm Lewis, M.I.Mech.E., chief engineer of the Manchester Corporation Hydraulic Power Department, inasmuch as he placed at my disposal a test apparatus of very steady hydraulic load on the water side. He also took a keen interest in the matter, and in collaboration we carried out a series of tests, commencing with 100 lb. steam pressure and 100 lb. water pressure, then changing the water pressure every few pounds down to 5 lb. This showed that as the head pressure of the water was taken off the efficiency of the steam in transmitting the heat units considerably increased, showing a very interesting curve.

Another series of tests was made with steam at 50 lb. pressure, starting with 5 lb. water pressure, and going up to 50 lb. This also made a good curve, but in raising the water pressure from 50 lb. to 100 lb. there seemed to be no difference in results. A third series of tests was made with steam at 25 lb. pressure and water from 5 to 25 lb. pressure.

As a result of the tests it is found that the reduction of heat transmission as indicated by a diagram follows a curve until such a point at which the water pressure becomes equal to steam pressure, and after this point any rise in the water pressures does not seem to produce any decrease in the heat transmission. As the decrease in the transmission of heat ceases when the water pressure equals the steam pressure, we may assume that as the point at which the decrease ceases is the point where the possibility ceases of the steam within the tube producing air bubbles on the outside of the tube, that the decrease in efficiency is due to the gradual reduction as the pressure increases on the water side of that proportion of the tube which is capable of producing on its surface on the water side minute air bubbles. This must be taken as a theory capable of clearer light on further investigation.

GREAT AND LITTLE BOOKHAM.*

IN preparing this paper upon Great and Little Bookham I found it was a less easy task than I expected, for every fact had to be dug out, and this entailed a good deal of investigation. The name *Bookham* was spelt in various ways—such as *Bocheham*, *Bokham*, *Bowkham*, and *Bokeham*. The probable derivation of the word is "Boc-land," which is explained as "Book-land," or land held by a charter, from "boc," a book or writing. Next to "ton" the commonest English suffix is "ham," which occurs in the names of insignificant hamlets, and even of isolated farms, denoting the house or "home" of an early settler. This may be the explanation of *Bookham*; that is, a place or enclosure of Chertsey Abbey—and, in the case of Little Bookham, the home of Halsard, who held it of William. This seems to me to meet the case, though I admit it does not appear to be the true meaning of the word. The word "boc," again, also applies to beech trees, but there are very few beech trees in this part. In an old dictionary it was given: "Such land as is held by charter, or instrument in writing, which cannot be conveyed to another either by sale or gift, but must descend to the next heir, an hereditary estate." The entry in Domesday Book is:—"The land of Chertsey Abbey in Fingeham Hundred, Bocheham (Great Bookham). The abbey itself holds Bocheham. In the time of King Edward it was assessed for twenty-six hides and now for thirteen hides. The land is for nineteen ploughs (team ploughs). In demesne there is one plough and thirty-two villeins, and four bordars with eighteen ploughs. There is a church and three serfs, and a mill worth 10s. and six acres of meadow. Wood for eighty hogs. From the herbage thirty hogs. Of this land Gunfrey (Gunfrid) holds one hide, and he has there one plough. The whole manor in the time of King Edward was worth 16 pounds, now 15 pounds." The mill mentioned in the Domesday Book was doubtless the water-mill at Slyfield on the river Mole, which was still in use within living memory.

St. Nicholas, Great Bookham.

I have taken the following description of this church from the paper written by the late H. G. Quartermain (September 30, 1893), having obtained permission from his widow to do so. The earliest mention occurs in Domesday as "the Manor, the Church, the Mill, and Wood, the whole worth in Edward the Confessor's time £16"—about £960 of our money. The oldest part of the church is the south of the nave; this may be even part of the church mentioned as of Edward's time, and, therefore, of Saxon work built under Norman influence. The pillars are massive, with flat cushion caps and plain semicircular arches over, similar to those at Little Bookham and Fetcham near by. These, again, may have been cut through Saxon walls early in the twelfth century. We can find reason for believing that the floor level has at some time been altered. The church measures 110 feet by 60 feet. The western bay of the south aisle, part of the earliest work now standing, is very narrow (5 feet 9 inches), as were nearly all early Norman aisles, with small and narrow Norman windows at end. The tower walls probably belong to the same period. They are massive, and may have been built only to their present height on account of the difficulty of obtaining stone; they are sur-

* Abstract from a Paper by Mr. O. M. Row, President of the Institution of Heating and Ventilating Engineers.

* Read at a meeting of the Upper Norwood Athenæum by Mr. T. C. Thatcher.

mounted with timber framing and spire. The belfry, you will notice, is one peculiarly characteristic of Surrey, and especially of the Surrey Weald.

The church is crowned by a small wooden bell-turret, and surmounted by a shingled spire, apparently perched, as seen from the outside, on the roof ridge of the nave, but really supported by massive timber framing or by tie-beams in the building below; this framing is placed at the west end of the nave. There are so many other instances of this form of construction that the builders appear to have distrusted their walls, and carried the bells on oak framing instead, such as Horley in Surrey, Sutton and Horndon-on-the-Hill, Essex. The pillars on the north side are octagonal and half-octagonal; with this variety of light and shade there is a better appearance. The type of cap to these columns with the arches indicate the change in style in building from Norman to Early English. But the design has been to keep the walls of similar height, and this has shortened the pillars. The chancel was built by the Abbot of Chertsey in A.D. 1341, who had undertaken its repair. This date is indicated by an inscription in Lombardic letters, cut on slab and built into the east wall of the chancel on the inside face of the south-east corner. This inscription has been noticed by Manning and Bray, and Aubrey, and is here given:—

Hec domus Abbate fuerat constructa a Johanne

de Rutherwyka, decus ob Sancti Nicholai

Anno Millesimo, tricensimo bis viceno

Primo: Xpc (Christus) ei pariet hinc sedem requiei.

It was very clearly cut (on clunch stone), but is now rather damaged in one part. It is an interesting and

we may take Abbot Samson, of St. Edmundsbury, to have been, to whom Carlyle introduced us in his "Past and Present."

In 1537 Chertsey Abbey and its possessions were surrendered to Henry VIII., when its annual income was valued at £660 per annum, or according to Speed, £744 18s. 6d., equal to about £1,300 or £1,500 of our money. Part of an old oak screen, said to be the parvise glazed with common glass, forms a lobby or porch to the south entrance, and it was from here the Shier monument now in the north aisle was removed. The south porch is of later Decorated work. It is of two storeys; the upper one was probably intended for the use of a chantry priest. There is a narrow door in the wall of the south aisle, now blocked up, and another to what would have been the room above the east face of the west wall of the aisle. The roof of the south aisle is of oak, about 1390.

The Slyfield family, whilst they held Slyfield, built a chapel for their own use on the south side, and the work, except where repaired, remains unaltered. Traces of a private entrance, now built up, are visible both outside and inside the south wall of the chapel. There is the lower portion of oak screen remaining, said to be part of the old rood screen, and there are a few fragments of stained glass from the south window, which have been preserved.

There are some paintings of the fourteenth-century pattern decoration on the screen in the south aisle, and there is a fine trefoiled piscina on the south wall. The oldest brass remaining, that to the memory of Elizabeth, wife of Thomas Slyfield, date 1433, is in the body of the church near

GREAT BOOKHAM CHURCH.

valuable record, because there are but few buildings possessing such recorded dates. There is a rare one in Holy Trinity Church, Clee, Lincolnshire, A.D. 1192; another at St. Mary's, Rolvenden, Kent, A.D. 1344; and at the most westerly church in England, St. Sennen, Cornwall, A.D. 1533. There is a peculiar one at Monken Hadley Church, Herts, where the date of the fifteenth century is given in figures, but in place of the ordinary figures four eights are cut in half, and there is an enamelled brass with date, I believe, at Cobham Hall. John de Rutherwick, Abbot of Chertsey, whose name is inscribed on this stone as the builder of the chancel, is otherwise recorded as being most active in such works. He appears also to have been a clear-headed ruler. His works were not extensive in themselves, but rather such as a master mind would find to do, in additions, repairing, and keeping all in order, over a large district. There are many records of the works done by him to the buildings which the abbey held, such as at Epsom, Ewell, and Egham. He was building a chancel just about this same time at Egham. But building was not his only work. He planted and enclosed, obtained remissions from the king and license to appropriate. He purchased the profits of Ewell Church, he obtained charters, bought lands and tenements. He gave Church vestments and a pastoral staff, thus looking to smaller matters. Doubtless his rule was very strict, and his labours unremitting. Elected in 1307, he died about 1346. In fact, he is just the sort of man

the pulpit, and is believed to be the oldest mention of this family. It has other memorials in the chapel floor, to Elizabeth, wife of Edmund, and also Henry Slyfield and his wife Elizabeth. The font is about the same date as the north arcade, and is a rather small one of hard Sussex shelly limestone, usually known as Petworth marble, found at Petworth, Chiddingfold, Bethersden, and elsewhere. This is of a similar nature to Purbeck, but of a much coarser description, containing larger shelly formation. I believe it was in 1845 a new aisle was built. This work has no claim to our notice. One of the bells in the tower, cast by the most celebrated of Surrey bell founders (says Mr. Daniel Tyson in his account of the "Church Bells of Sussex"), has this inscription on it: "William Eldridge made mee 1575." At the confiscation, the church, as part of the Abbey of Chertsey's possessions, was seized by Henry VIII., and for a short time transferred to Bisham in Berkshire, which in its turn was also dissolved (1539). Soon after, the advowson of the church was granted to Richard and John Savile, who sold it to Sir Christopher More, of Losely. He again sold it within a short time. In the inventory made by order of Edward VI. there is mentioned one chalice and "aulter" front, with the vestment for the Communion table and four bells. The brass or latten, which had not been stolen, was sold to the parishioners for forty-five shillings. The window at the east end of the chancel is to the memory of Charlotte Sophia, Duchess of Beaufort (1856); the one at the east end of

Slyfield Chapel is to Lord Raglan, the Crimean hero (1859) ; and the one in the aisle to Major-General Howard Vyse (1853). Several of the Howards of Effingham are buried here, and several of the Bonsor family. In this chapel are buried the successors of the Slyfields—"Here lyeth the body of Robt. Shiers, of the Inner Temple, London, Esqre., 1668" (1660). He was second son to George Shiers, Esq., who

GREAT BOOKHAM CHURCH.

purchased Slyfield Place, and he succeeded upon the death of his father, his eldest brother having died previously. There is a floriated cross on a slab in the churchyard, near south porch, of fourteenth century date, and in 1627 an elm was planted at the south corner of the churchyard ; the trunk is still standing and is sending upwards a group of sturdy branches—probably the identical elm that was planted, according to the parish register, during the churchwardenship of Ralph Hilder. The rough translation given by J. E. Morris, B.A., of the inscription on the slab in the interior east wall, to the south of the table, runs : "This house was erected by Abbot John de Rutherwyke, to the honour of St. Nicholas, in 1341. May Christ give him rest for this good work."

The inscription on a brass plate to Edmund Slyfield, who died in 1590, has a long and curious rhyming account of his virtues, &c., amounting to no less than twenty-eight lines. I have taken a few of the lines:—

"Of Slyfield Place, in Surrey solle here Edmund Slyfield lyes ;

A stout esquier who allweys sett Godes feare before his eyes."

And again :—

"He toke Elyzabeth to wyfe—a dame of famous rase,
She of the Pawletts dyd dissend, and Capells in like case.
And he with her, and she with hym, thaire dayes in love dyd pass.

In wedlock she brought fourthe to hym 5 sones and daughters 11,

Whiche carefullye they dyd instruk to serve the God of heaven."

In 1890 Major Heales remarked that the east end of the south aisle was parted off by a "mutilated screen." The lower part, still remaining, is of fifteenth century workmanship ; on the top of this is fixed a small brass plate, bidding us pray for the soul of John Barmsdale (d. 1481) and "Marion his wyf."

The Rev. J. Charles Cox in his paper on "The Religious Houses of Surrey" mentions Bookham : "In 1292 the Bishop of Winchester permitted the Abbot and Convent to retain in their own uses the church of Bookham, which was of their patronage, provided they presented a suitable person as vicar, with a sufficient income, to perform Divine service there. It was stated as a reason for this concession that the funds of the monastery (Black Monks, or Benedictines) had lately decreased, by exactions, by pestilences, and by the inundations of water that affected animals, flocks, and other property of Chertsey. Among the churches thus appropriated in Surrey in addition to Bookham were those of Cobham, Coulsden, Epsom, Ewell, Horley, and Waltham." The estates of the Abbey of Chertsey were free from the bailiff's jurisdiction.

There have been families of note in this village, as you have seen from the various memorial tablets in the church, and the most noteworthy are the Howards. There are several stones to members of the family of Howard of Effingham, formerly of Eastwick Park and lords of the manor of Great Bookham. On the floor south of the altar is a slab to Sir Francis Howard (1651), grandson of Lord Howard of Effingham who commanded the English Fleet against the Spanish Armada, and great-grandson of Thomas Howard, Duke of Norfolk. In the churchyard is a large vault, now completely covered and turfed over, containing seventeen members of the Howard family, mostly of the eighteenth century. On the floor at the east and west ends of the north aisle are two good armorial stones to Mary (1663), wife of Sir Henry Jerningham, and to William Wilder (1659).

In the parish register there is an interesting entry of the excommunication of the wife of an earlier George Shiers in 1633, and again in 1634 (she having apparently been absolved meanwhile), and of the husband also in the latter year, but for what offences does not appear (Sharp). There is a white marble tablet to Lord Downe, 1760, and other members of the Dawnay family, formerly of Bookham Grove. A monument to Cornet Francis Geary, 1776, eldest son of Admiral Sir Francis Geary. The cornet was killed in the American War. The Gearys lived at Polesden Lacey in

GREAT BOOKHAM CHURCH.

this parish till they sold the property to Richard Brinsley Sheridan.

The lych gate was erected in 1897 to commemorate the sixtieth year of Queen Victoria's reign. A stone coffin lid lies in the chancel, supposed to be that of John de Rutherwick. All the stained glass is modern.

Fanny Burney resided in this village for a short time, at a place called "Fairfield." The early days of Fanny

Burney were passed with the Thrales, at Streatham; with the Crisps, at Chessington; with the Lockes, at Norbury, near Dorking. At the Court of King George III. at Kew a tedious time was passed in the quiet retreat of a country home, living, as she expressed it, "without form or ceremony of any sort." It was, however, at Mickleham, near Dorking, and at Bookham, situate in the most picturesque part of the county, that much of her time was passed in literary work, and in friendship and intercourse with noted men and women of the day. At Mickleham her marriage with Monsieur D'Arblay took place in the year 1793, and a sojourn there of some years has claimed for this part a distinct and lasting memorial. It was here (Bookham) that the plans for writing her novel "Camilla" were considered. In 1796 the book was published by subscription, and dedicated to Queen Charlotte; and from this spot Madame D'Arblay set out to present the first copy to the King and Queen at Windsor, by whom it was most favourably received. The Surrey home which has the greatest interest in her career was "Camilla" Cottage, situated at West Humble, on land adjoining Norbury Park, the residence of Mr. Locke. The D'Arblays lived here till 1802, when they left for France, and Madame D'Arblay never resided in Surrey again.

St. Nicholas, Great Bookham.

"Thys inventory indentyd and made of all the ornamentys pertenying to the church of grett Bokham the X day of March in the iiij. yer of the reygne of Kyng Edward the VI. wytneth her of Sir John Hylton vycar, Rycharde Arnold, John Martyr, Rycharde May, John Hudson, Raff Stevyn.

Fyrst one chalys of sylver
Item iiij. corporas with casys
Item a pyx of coper and gylt
Item iiij. candylstyches of latyn
Item iiij. altar clothes
Item a curtyn of grene and blue satyn
Item another curtyn of sylk
Item a vestment of red velvett with a sute
Item a vestment of grene satyn with a sute

churchwardyns

Nicholas Leigh
William Saunder
Thomas Martyr
Rycharde May
John Hudson.

It is recorded that the churchwardens of Great Bookham "Fyrst paid for the boke of Common Prayer iiij. viij. and for keping of the belles ijs."

"To the vijth and last article we say that there be no goodes imbeselyd nor left out of the inventorye to our knowledge otherwyse then afore ys declared

Sum receyved vjs. viij.

Sum paid vjs. viij.

And so neyther the churche ys not indettyd to the churchwardens nor the churchwardens to the churche."

There is a similar statement made with regard to Little Bookham, except—"Nothing was received and nothing paid." The Parliamentary survey of church lands in Surrey was made between 1649-1658, the Jurors being sworn in at Kingston-on-Thames on February 25, 1657.

"15.—Also wee present Richard Carter is present Incumbent of Great Bookham and is worthe flortie poundes by the yeare the patron thereof is Samuel Rouse Esquier. 16.—Lastly wee present that Mr. (blank) Henley is p'sent Incumbent of little Bookham and is worthe aboute fiftie poundes by the yeare the patron thereof is the Countesse of Peterborough and is halfe a mile distant from Great Bookham and very good way both winter and summer. In testimony whereof wee the Jurors aforesaide have hereunto sett our handes and seales this present Eighteenth day of Marche in the yeare of our Lord God 1657."

It may be interesting to note that the Surveys, bound in Volume 21 of the Lambeth Library, all are of parchment with the signatures appended at the foot of each.

Bokham Magna.

Wardens—John Hudson, John Marter.

Deliverid into the churchwardens there the xvij day of Maye anno regni regis Edwardi Sexti septimo by Sir Thomas Carwarden Knight Nicholas Leigh and William Saunder esquiors commissioners of our soveraign lorde the King among other to that effect these parselles of churche goodes here after ensuing

Imprimis a chalice poiz xiiij oz.

Item an aulter front and a vestment for the communion table.

Also remaining in their charge to the kinges use iiij belles in the steeple.

Sales.

All the ornamentes then sold to the parishioners with the grasse and latten for xlvs. Summa patet.

(To be concluded.)

ART EXHIBITION AT MUNICH.

THE Board of Education have been informed, through the Foreign Office, that the eleventh International Art Exhibition will be held in Munich from June 1 to the end of October 1913, under the patronage of H.R.H. the Prince Regent Luitpold of Bavaria. The exhibition, which is organised by the Munich Artists' Association in union with the Secession of Munich, and with the assistance of the Royal Bavarian State Government, will be held at the Royal Crystal Palace of Munich. Works of art in the different branches of painting, sculpture, architecture, engraving, and art industry are admissible to the Exhibition. The management of the Exhibition is vested in the Central Committee at Munich, and further information can be obtained on application to the Secretary of this committee.

ILLUSTRATIONS.

DOORWAY, QUEEN'S HOTEL, YORK.

THE drawing shows one of the doorways in the dining-room on the first floor of the hotel. The room is lofty, and is treated in bays, formed by pilasters of the Corinthian order, surmounted by a rich entablature, above which the ceiling is coved. The inter-pilastration is filled by a large panel, below which is a smaller one. The ceiling is slightly modelled. The whole of the woodwork is painted white. The building was once the town house of the Duke of Sutherland, and dates back to the time of Charles I. An interesting feature of the building is the spacious staircase in the hall. The drawing reproduced was submitted in one of the monthly competitions of *The Architect Students' Sketching and Measuring Club* by Mr. E. H. Gibson, who has been awarded our Travelling Studentship for this year.

FRENCH INTERIOR DECORATION.

THE ceiling of the boudoir of Madame de Serilly was formerly at 106 Rue Vieille-du-Temple, Paris, and is now in the Victoria and Albert Museum, South Kensington. The centre painting is by Jean Jacques Lagrenée, called le Jeune.

The library of the Montagnacs was formerly at 52 Rue de Grenelle, Paris, and is now at the salerooms of Messrs. Litchfield & Co., by whom the photograph was taken.

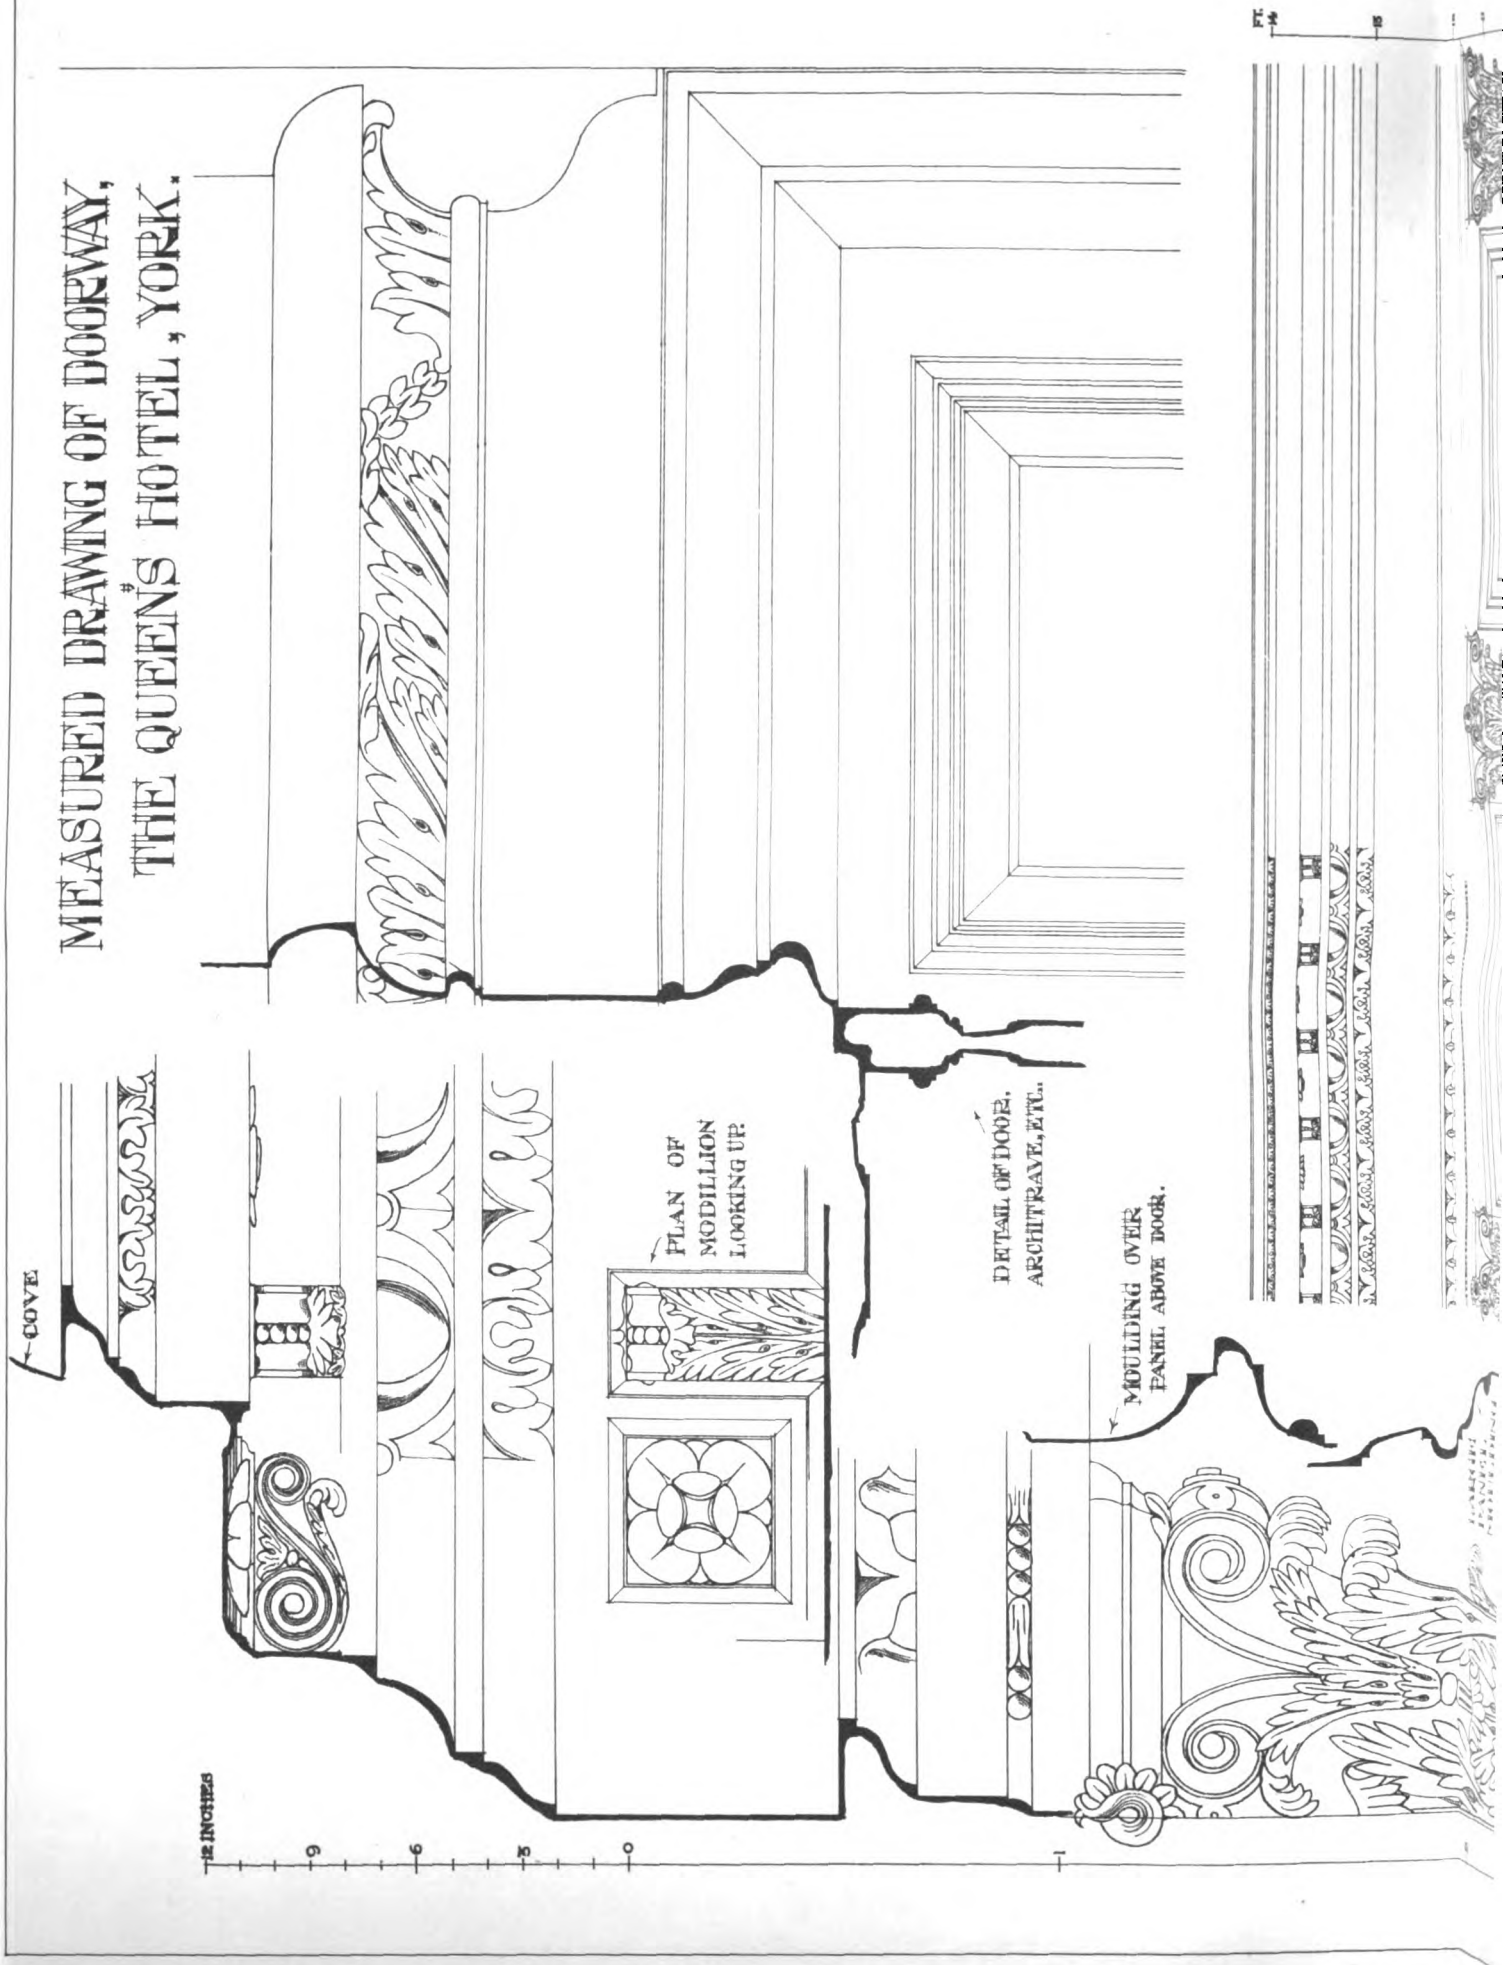

BOROUGH OF STOCKPORT ELEMENTARY SCHOOLS.

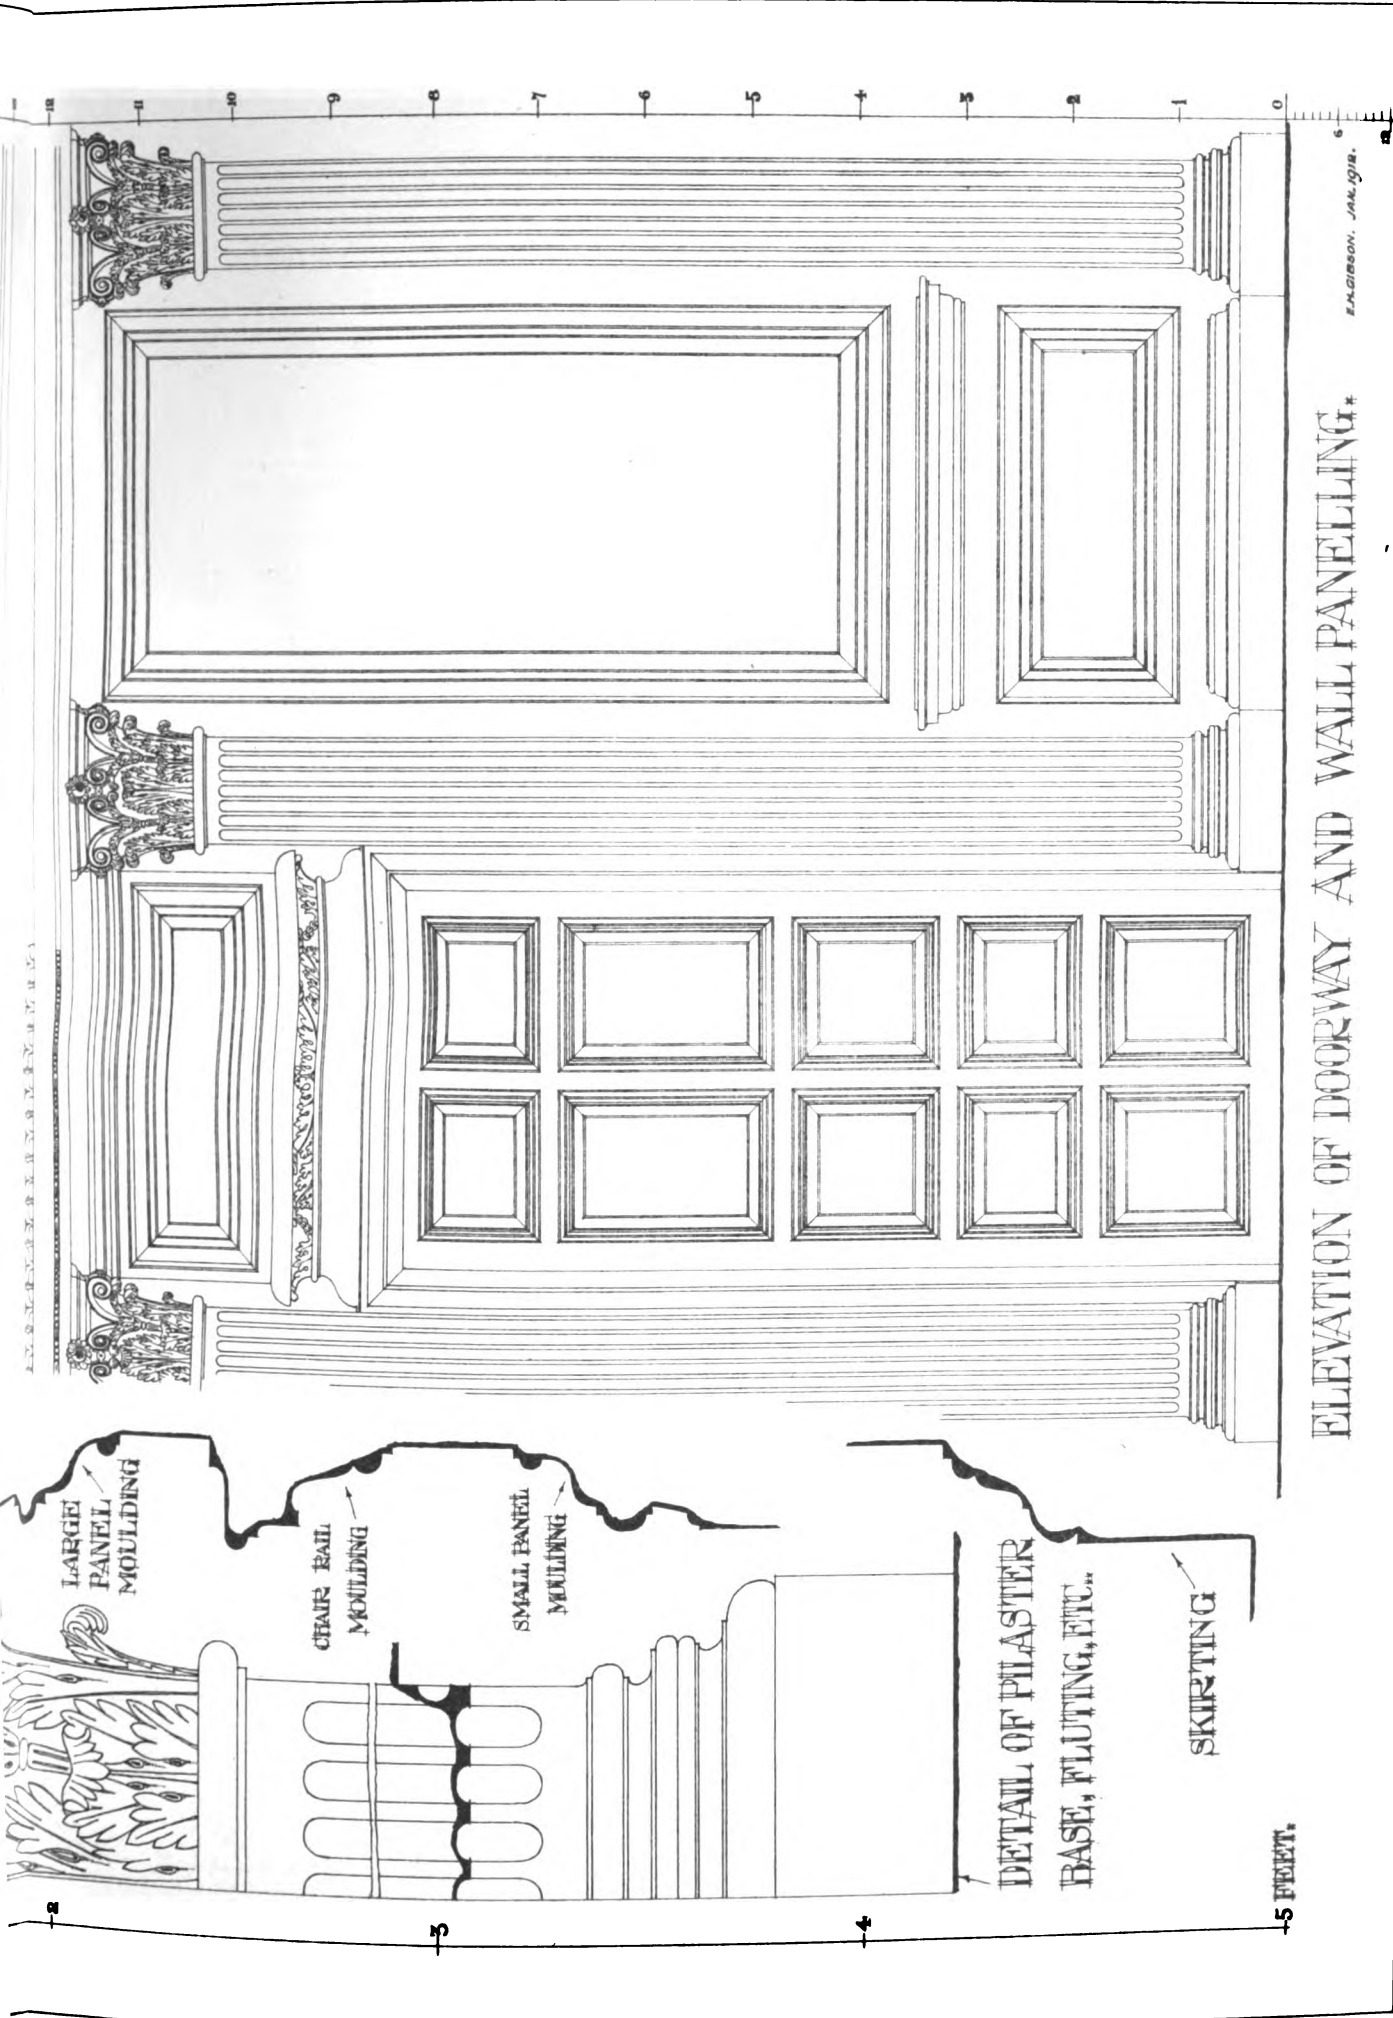

THIS school design by Messrs. Reginald H. Spalding, A.R.I.B.A., & Ernest G. Theakston, is a good example of the new type of elementary school plan.

INTERIOR DECORATION.—II.

By ALBERT E. BULLOCK, A.R.I.B.A.

FRANCE.—II.—THE EIGHTEENTH CENTURY AND AFTER.

(Continued from last week.)

THE tapestry industry established by Francis I. at Fontainebleau with Flemish workmen was carried on by Henry IV. The factories of the Gobelins at Bièvrebach and the Savonnerie at Chaillot date from about 1630. Carpets were chiefly manufactured at this latter place in the seventeenth and eighteenth centuries. There were also factories at Beauvais, where Oudry superintended, and at Aubusson, where Jacques Bertrand worked on the designs of Corneille, and also those at Felletin. Besnier succeeded Oudry at Beauvais about 1734, and Boucher superintended other departments. The industry suffered much at the hands of Colbert's successor, Louvois, who is credited with little taste for art, and much less commercial instinct than Colbert. He had a friend in Mignard, the rival of Le Brun, who died in 1690, and Mignard five years later. Villacerf succeeded Louvois, and the Duke d'Antin became director of the industry. He employed Robert de Cotte to superintend the execution of the work, a post the architect maintained until 1736. About 1713 Le Sieur Dagly, who lodged at the Gobelins, introduced the making of Japan ware, which was later developed by Vernis Martin, a carriage painter, born in 1706. The name Vernis de Gobelins is given to work of this class.

André Charles Boulle, the well-known joiner and cabinet-maker, practised in inlaid veneer work known by his name, consisting of marquetry laid on a ground work of parquetry ornamented with chased and shaped metals, tortoise shell, pearl and ivory inlaid between the hardwood veneers. The designs were usually cut in pairs and counter-changed in the manner known in joinery as quartering. Daniel Marot has been reserved to this paragraph on account of his connection with Boulle, although he really belongs to a previous generation. His style of decoration exists at the Elysée in the Salon des Aides, the fine shell carved panels having been brought here from the Château de Bercy, built by François Mansart for M. Paris. Marot went to Holland upon the revocation of the Edict of Nantes, where he made the acquaintance of our William III., who employed him as his architect. He and the younger Berain made many designs for Boulle work.

The illustrations of Versailles are from Rouyer. The Salon de la Guerre was painted by Blanchard under Le Brun; the carved oval of Louis XIV. is by Coysevox, who also modelled the bronze figures. The Louis XV. example is from the Salon des Médailles, Adelaide wing, showing a typical casement and chimney-piece. The illustrations from Pfno's "Fontainebleau" show the decoration in the gallery of Henry II., Martin de Freminet's work in the chapel of Henry IV., Saint Trinité in 1608, the throne room of Louis XIV., and a small example of Louis XV. period from the council chamber. This latter room was designed by François Boucher, the panels being painted by J. B. M. Pierre, and the flowers by F. Peyrotte. Christophe Huet was responsible for the ornaments; he was particularly skilled in arabesques and designs for tapestry. There are examples of his work at the Château de Chantilly, in the Cabinet des Singes, where the little monkeys sport themselves with all the cheek of the life, and at the Hôtel de Rohan, where are also to be seen examples of the style called "Chinoiserie," a light style of ceiling and mural decoration practised by Le Brun, Leseur, Coppel, Vouet, and Natoire. Berain's ceilings were of a light Italian style, while the work of Watteau, Huet, and J. B. Leprince followed the school of Mantegna, with trellis work prominent in the design.

The salon of Louis XV. at the Louvre, executed about the same time as Huet's Cabinet des Singes, is a distinct contrast, exhibiting a much severer style, a plain wainscot, and a rather heavy ceiling. The wrought-iron grilles of Jean Lamour at the Place Stanislas, Nancy, laid out by Emmanuel Héré, and the balustrade to the Hôtel de Ville built by Héré de Corny are examples of the late work of this reign. The staircase rail at the Petit Trianon is a late work by François Gamain; in the salle-à-manger of Marie Antoinette here the chimney-piece is the work of Honoré Guibert. The steel and iron gilt rail to the staircase at the Palais Royal is the design of Coutant d'Ivry, and was copied at Chantilly for the Duc d'Aumale. The subject of English ironwork has been recently dealt with by Mr. J. Starkie Gardner, in which several French examples are referred to.

French sculptors are legion. Many worked at will on the

softer materials of decoration of the plastic order, and it is not a little difficult to bifurcate them. The names of Pajou, Lecomte, and Moineau stand out prominently, as their work was very popular. There are statues by them in the dining-room of Madame Du Barry's château at Luciennes. The ceiling of the room is a painted Olympus; the walls are of marble, with Corinthian pilasters having gilt bronze caps and bases. The bas-relievo frieze is framed in gilt mouldings, and crystal chandeliers are attached to the mirrors. There are similar specimens of this style of decoration at Choisy, Gaillon and Rambouillet. A late Louis XVI. dining-room exists at the Palace of Compiègne, which is decorated with fluted Ionic pilasters in pairs the full height of the wall to the entablature. The carved panels to the over door and the chimney-piece are in grisaille, by Sauvage. The later work at this palace is a trifle stiff in treatment. The bedchamber of Marie Antoinette here is attributed to Rousseau (de la Rottière), and, if so, it compares rather unfavourably with his earlier work at Fontainebleau and elsewhere.

The family of the Caffieri figure prominently in the annals of French decoration. Philippe Caffieri was brought from Rome by Mazarin, and was installed at the Gobelins by Colbert, who employed him at Versailles and Dunkirk, at which latter place he acted as sculptor to the vessels then in course of building. He was succeeded by his eldest son. His fifth son, Jacques, the father of Jean-Jacques, was gilder and carver to the King. Philippe Caffieri II. and Jean-Jacques were brothers. The latter was an eminent member of the family who was brought into distinction by his noted altar of St. Louis des Français at Rome. Another distinguished family are the Audrans, of whom Claude the second (1639-84) distinguished himself in fresco work under Le Brun. He painted the chapel of Colbert's château at Sceaux, the gallery of the Tuileries, the grand staircase at Versailles, and other works. At the Tuileries he was assisted by the artists F. Bonnemer, Monier, the younger Corneille, and the younger Vouet on the ceiling of the King's audience chamber. This work is now destroyed, as is also the gallery of the Hôtel de Bretonvilliers in the Ile St. Louis, where nine compartments of the ceiling were painted by S. Bourdon, who was also a skilled engraver. Fortunately, his designs were engraved by Friquet de Vaurose, a pupil, prior to the demolition of the work. Some very interesting lists of artists and workmen who left Paris for St. Petersburg in 1716 with Le Blond and Pineau to work at Potsdam, of the Gobelins officials, and of French cabinet-makers from "Le Mobilier au XVII. et au XVIII. Siècle," are given in the appendices accompanying "French Decoration and Furniture in the Eighteenth Century," written by the late Lady Amelia F. S. Dilke, 1901.

It is not the intention to treat the different styles of French furniture which accompany each period of decoration, as has been common among writers on the subject previously, partly on account of the limited space available for the purpose, the magnitude of the subject in hand, and largely because the practice has gone out of vogue in consequence of the expense attached to securing genuine examples of such work and the unsuitability of much of it to modern requirements. The museums already mentioned contain examples *in extenso*, and the work last referred to, together with "The Decoration of Houses," by Miss Edith Wharton and Ogden Cotman, junr., and many other like works, contain numerous illustrations showing the application of the furniture of each period in connection with the architectural decoration of the same.

The chief cabinet-makers besides those already mentioned were Slodtz, Riesener, Oeben, Petit, Thomire, Martin Carlin, and many others. Thomire was also a painter of porcelain for the Sèvres works, with Boizet, Carlin, and Paftrat. De la Fosse, Jacques Caffieri, and others executed metal work. The manufactory of Sèvres, which owes its success so much to the patronage of Madame de Pompadour (d. 1764), who set the fashion in art during the reign of Louis XV., was established between 1753-56.

Coppel's original cartoons for the tapestries illustrating the life of Don Quixote are at Compiègne. The subject occupied the looms nearly one hundred years, i.e. from 1735 to 1830, the works being then under the management of the Comptroller, General Orry.

THE WORKS OF THOMAS GIRTIN AND OTHER ARTISTS.

WE believe that it was Sir Gilbert Scott who said that if a man had not made a name or position for himself by the time he was thirty years of age he was a failure. Perhaps Scott did not word it quite so baldly or broadly, but that is the effect of the statement. In Thomas Girtin (1775-1802) we are confronted by a brilliant instance of early fame, for he was an artist of note before he attained his majority, and he was in the zenith of his powers when he died. Early fame, yes! But where are those who now think or speak of Girtin, except the few art-historians and the fewer veteran artists? *Eheu! fugaces labuntur anni.*

At the exhibition of works now on view at the Leicester Galleries there are altogether close upon one hundred and fifty pieces, and of these eleven are the work of Edward Dayes and twenty-two are the work of Thomas Girtin.

And we will first consider these two artists, just noting an interesting similarity in the experiences of Thomas Girtin and Benjamin Franklin. The latter was subjected to the harshness of a brother, to whom he was bound apprentice, and who jealously resented the attention paid to the latter

for his natural gifts; so, too, did Edward Dayes act towards his apprentice Girtin under similar conditions.

Girtin kept for a time remarkably close to Dayes' methods of workmanship and style of work, but later on he broke fresh ground, and was accorded the general approval for his work on independent lines. So much (or so little) by way of history.

One great point of similarity between the work of these two artists was the particular method of delicately touching-in the skies. As regards Edward Dayes, he had a happy knack of giving the effect of "haze" to the atmosphere; "Old Aberdeen Cathedral" and "Dunfermline Abbey Church" show a yellow haze, whereas in "Pluscardine Abbey, Elgin," the effect is blueish, and in "Elgin Cathedral" it is grey. All these works date from 1792. "The Observatory, Greenwich," "The Market Place, Salisbury," and "Castleacre Priory, Norfolk," are too clear-cut in technique to be altogether pleasing.

Of Girtin's works now exhibited the better are mostly to be found amongst those painted during the last three years of his life. "St. Vincent's Rocks, Clifton" (1802), is perhaps the best; there is very little light in the treatment, but the shade effects are good, and the bold cliffs, with the river coursing through the deep gorge, provide a tout ensemble altogether impressive. "The Valley of the Wharfe" (c. 1800) is also in gloom, and is equally impressive in its pictorial display; "Landscape with the Wooden Bridge" (1802) is very pretty, and is softly toned. One of Girtin's earlier works, "Helmsley Castle, Yorkshire" (1792), is reminiscent of the Dayes' influence, and the snow-clad ruins are excellently portrayed. "Carnarvon Castle" (1801) is noticeable for the good "scale" which the building provides in the picture.

From the work of other artists architects will select with interest specimens by George Dance, R.A., and Paul Sandby, R.A., the latter's "Rochester," with its blue distances, healthy foreground tree, and cloud-bedecked sky, providing a truly worthy sketch. A curious picture is J. C. Ibbetson's "The Artist Sketching," where the said artist is seated in the middle distance with his back towards us, and obviously not in a position to portray both the foreground and the background, except he were Mr. Facing-both-ways, and obviously in the present instance not in a position to portray the foreground, towards which his back is squarely set. We much admire H. Bunbury's "Three Dancing Girls" for the graceful posing, the delicate tinting, and the pleasing vignetting. For T. Rowlandson we can never feel enthusiasm; if we say that in some of the exhibits he is not intolerable 'tis but damning with faintest praise. But there is an exception, for whereas the "Interior of the British Institution" is quite unpleasantly and completely Rowlandson, "Shipping," by the same artist, is quite as pleasantly un-Rowlandson.

D. H. McKewan's work is worthy of note. "Tapestried Bedroom, Cote-Hele," being attractive in its delicate colouring, its chiaroscuro, and its well-depicted hanging draperies. "At Knowle," by the same artist, might be the work of John Nash himself, but it proves less pictorial than the last, though it is so good. J. R. Cozens' "Lake Albano" is on a level of excellence with the "St. Vincent's Rocks," by Girtin, and G. A. Fripp's "Near Tintagel" is very fine, and is full of artistry; the water is tonefully realistic, but the rocks would bear strengthening.

P. de Wint's "Wenlock Abbey" has, like so many on show, pretty evening colouring, with all the evening calm suggested. Notice must be accorded to the joint composition of two Associates of the Royal Academy; "The Falls of the Tay," by J. W. North and F. Walker, is truly delightful, and the swirl of the waters could not be better depicted. There is nothing more worthy of notice than H. Gastineau's "Richmond Hill" (1852); it is a perfect poem of idyllic beauty. G. Barret's "Classical Landscape" is good, whether viewed in regard to its clear evening sky, its water, or its architecture.

There is but one example of John Ruskin, and that not admirable, "Glacier des Bossons, Chamounix," being a very confused colour sketch. Mr. J. M. Swan's, R.A., zoological studies are all thoroughly good, and well modelled. Of the fifteen pieces by W. Callow three alone prove of interest, and of these only one, "Leicester Almshouses" (1856), is really pictorial. H. G. Moon's two studies of orchids are excellent. A. N. Roussof's "A Side Canal, Venice," is a charming little wayside colour-piece; this and F. Mura's "A Winter's Day" are two of the comparatively few pre-eminent exhibits. The latter is very telling in free sepia, with the lights beautifully managed. The show is one well worthy of close and prolonged inspection.

THE PAINT AND VARNISH SOCIETY.*

(Concluded from last week.)

THE President (Mr. J. Russell Thornbery) said he felt that although much of the matter introduced by Mr. Line into his paper had gone far outside the actual subject under discussion, it was not to be regretted, as it would not be well for the Paint and Varnish Society, in considering the toxicity of white lead, to shut their eyes to the fact that strong objections were raised to the use of lead in other industries, on account of the bodily suffering caused to a great number of individuals engaged in trades in which lead in various forms was employed. So far as he was concerned, he was not interested in white lead, and had nothing to do with it in his business. He, personally, could hardly understand any but decorators or ignorant people making use of it for decorative work in such towns as London or Sheffield, as, in his opinion, other materials could be used with a greater advantage; but, although there were differences of opinion in the paint and varnish trade upon that question, he felt sure that all were much more interested in the wider subject of doing everything possible to guard the interests of all workers in lead, and that vastly larger number of human beings who, in one way or another, came in contact with it. The personal interests of the members of the Paint and Varnish Society were small compared with the benefit of the human race, and he thought the Society should not allow that consideration to be excluded. Mr. Line was obviously an enthusiast on the abolition of white lead, and from many passages in his paper it would appear that he went much farther, and would like to prohibit the use of lead in any form for any purpose. The President said he was not one of those who objected to enthusiasts or fanatics; he always felt that they had studied their subject, although it might be only one view of the subject, still they had specialised in a part, and it was always well to hear a specialist. Mr. Line's propositions were far-reaching, inasmuch as the lead trade entered into an enormous number of industries. In linking up the particulars of the ill effects of lead as Mr. Line had done, and in the marshalling of his statements and figures, he had succeeded in putting before the Society an appalling tale of suffering. In the bulk the figures were impressive, but if they were spread out over the whole of the very large area represented by the trade in lead they would not afford much covering. Mr. Line had also furnished information from all parts of the country and all over the world, even from America, and although we had no control over what other countries were doing, lessons might be learned from them. The fact that Mr. Line had mentioned the great reduction in cases of sickness which had been effected by one method or another, proved that it was the conditions under which people worked in lead, rather than the material, which were at fault. What was required in the case of the use of lead was that attention should be fixed upon the improvement of methods, and not upon the abolition of the use of the material. The speaker was not impressed by the comparative figures, as between 1910 and 1911, inasmuch as such figures might easily be affected by fluctuations in trade. There had been a gigantic increase in employment in certain industries of late years, and the enthusiasts for the abolition of lead held up hands of holy horror at the appalling increase in lead poisoning. The increase might have been proportional, but the only way to make comparisons was over a lengthy period allowing for fluctuations in trade. Had the figures been taken for a period of, say, 20 years, he believed that it would be found that with increased attention to ventilation and general care and cleanliness in the conditions of the workers, there would not in the near future be much to grumble at in the conditions of the lead worker or user.

Mr. J. G. McIntosh objected to the compliments paid by the author to the work of Sir Thomas Oliver, whom he regarded as being ignorant of what happened when a drying oil dried. Had he been conversant with, and realised the fact that the atmosphere was robbed of its oxygen, he must, perforce, have come to quite different conclusions to what he had done. The oil absorbed oxygen, and in a confined atmosphere it would be chiefly the inhalation of an atmosphere with nitrogen in far greater excess than usual that would play such havoc with the red corpuscles. The coach-painting trade afforded an instance of the absorption of

oxygen, and of working in such a confined, warm atmosphere, with nitrogen in excess, and oxygen not in sufficient amount to aerate the blood. It was untrue to say that white lead paint gave off lead fumes. Even Professor Baly himself had retracted. Pure alcoholism was often confused with lead poisoning, and many authorities (medical) asserted that were alcoholism done away with lead poisoning would disappear. He did not think that Mr. Line had been quite fair in his quotations from Sir Thomas Oliver. He omitted the fact that the latter had given $\frac{3}{4}$ oz. of white lead to a rabbit in 18 months, without any sign of plumbism; whereas it was on record that 7 grains of zinc oxide had killed a rabbit. The speaker denied that there was an ever-increasing danger of plumbism; as Mr. Line had said, State regulations had enormously diminished plumbism all over Europe. The speaker referred to Dr. Goadsby's experiments, in which the latter found that lead sulphate was more soluble in the gastric juice than litharge or white lead. He had himself dealt with the subject in lectures delivered at the Regent Street Polytechnic 27 years ago, and in which he predicted this same result. As the chairman had remarked, other substances than white lead were poisonous. Sir Robert Christison, one of the most eminent of British toxicologists, had chronicled the case of seven men totally paralysed in the lower part of the body, from the waist downwards, in one factory in Glasgow, due to working with black oxide of manganese. Lithopone, as a pigment, was even worse than zinc oxide, and neither constituted a substitute for white lead at all. It was a well-known fact that an equal number of coats of white lead and zinc oxide did not cover the same surface, as many as four coats of zinc oxide being required to cover the same surface as three coats of white lead. With regard to the Pasteur Institute experiments, the French practical paint experts on the committee had themselves condemned these experiments, and withdrawn from them in disgust. As all would be aware, zinc oxide was attacked by sulphurous acid. It had been the burden of all the experiments made hitherto to prove the impossible, viz., that zinc oxide was better than white lead. In applying zinc oxide and white lead paints authorities were agreed that zinc oxide paint required quite different treatment altogether from white lead paint; and if white lead were forbidden working painters would never take kindly to zinc oxide paint, as the difficulties in its general application were very great.

Mr. W. F. Reid referred, in the first place, to the assimilation of the lead in the system. It had been stated that sulphate of lead was assimilated more than white lead, but the speaker did not consider that in all cases it was the gastric juices that assimilated the lead; the greasy secretions of the skin were most active in this respect. Lead was absorbed in the same way as mercury, by mixing it up with the fat. Persons secreting greasy matter in the perspiration were particularly liable to the absorption of lead in contact with the skin. He had, indeed, made tests of individuals susceptible to lead poisoning. The method was to take a piece of coloured tissue paper and press it against the portion of the body secreting perspiration, especially the nose or temple. On holding it up to the light after drying it would be found that little globules of fat had been absorbed by the paper. As had been pointed out, the expansion or diminution of different industries had a greater effect than the greater or less use of lead. Lead, for instance, was not made in Newcastle to the same extent as formerly; and he did not think the lead poisoning of painters was capable of comparison with the lead poisoning of factory workers; the factory worker might handle tons where the painter handled pounds, the same quantity of lead, therefore, coming into hundreds of hands instead of one pair. Painters, of course, handled the material very intimately. He could not otherwise account for the large number of cases of lead poisoning in the coach-building industry than by suggesting that it was due to the rubbing down of numerous coats of paint, which produced a dust that was inhaled. The speaker had been in the habit of oxidising large surfaces of linseed oil, which had been treated with lead driers. He had worked about a dozen buildings, each having a surface of 600,000 square feet. The air was saturated with a volatile product which, he might say, was chiefly acrolein. It might be thought that with such a large area there would be numerous cases of "lassitude and sickness," but he had never met with any evil symptoms among the workmen excepting violent irritation of the mucous membranes, particularly of the eyes and nose. He thought the question of leadless glazes had been overdone. Our Government had done as much as any Government to diminish sickness caused by dangerous occupations. Generally speaking, lead poisoning was often attributed to certain

* Discussion on a Paper entitled "The Toxicity of Lead," by Mr. Charles A. Line, which appeared in instalments in our issues of June 21 and 28, and July 5.

occupations, when it might have been derived from other sources. The action of lead had to be considered on what Metchnikoff had called the "flora" in the human bowel. Some of the diseases caused by minute quantities of lead might be due to the poisoning of this flora, which, as recent investigations had proved, had a great influence upon health. A small quantity of lead or mercury might cause the destruction of these minute beneficent organisms.

Mr. C. A. Klein said that it would be a matter of interest if the author could show the method by which he had been able to foreshadow the report of the present White Lead Committee. The speaker had been a witness before that committee, and certainly considered that until a report was published it was incumbent on all to avoid expressions indicating their ability to foreshadow the conclusions of a committee whose proceedings were as yet private and confidential. It was therefore surprising that Mr. Line considered that he was able to forecast the findings of the committee. He did not think that Mr. Line had added anything to the report of Sir Thomas Oliver made to the Bureau of Labour at Washington. Indeed, the lecture was a résumé of this report, with no additions of any real value by the author. Those who knew that report would feel that Sir Thomas Oliver had not been altogether impartial. A ghastly array of figures and statements had been presented which did not represent the present position of affairs, as was obvious when one found that the figures of Mr. Line were incomplete and not up-to-date. It was only necessary to read the first ten pages of the report to realise that technical inaccuracies were frequent, even with regard to such details as the descriptions of the processes used in the manufacture of lead products. Mr. Line had stated that British lead was mined in a metallic state, and that the freedom of the British miner from poisoning could be explained on this account. This was but one instance showing the course adopted by the author—namely, the repetition of other people's statements without verification. The statement in question was due to Sir T. Oliver, page 4, Bulletin, Washington. The lead was mined as galena (lead sulphide), and the comparative immunity of the miner from lead poisoning was not difficult to explain. It was well known that lead sulphide was probably the least soluble lead salt in general use in consequence of the fact that the process of solution in the gastric juices was limited by the reversible nature of the interaction in which equilibrium was readily established. Advantage had been taken of that fact in more than one lead works in England, where the men had been supplied with sodium sulphide pills, so as to produce lead sulphide, which was insoluble, or practically insoluble, beyond the equilibrium stage in the gastric juices. The experiments of Dr. Goadby supported these conclusions. When dealing with basic sulphate of lead Mr. Line was by no means clear in his remarks. In one part of the paper he had said that lead sulphate was not as soluble as lead carbonate, but later on he had quoted Dr. Kenneth Goadby in this relation, but had not given any figures or shown how the experiments were carried out, and the speaker felt he must protest against this irregular way of presenting figures. The experiments were, however, of vital importance, and should be properly recorded, because they were the only experiments on record in which human gastric juice had been used; in all other cases artificial gastric juice had been employed. The juices had been obtained from patients in the hospital, and had been used to determine the solubility of red lead, litharge, white lead and sulphate. The figures showed that (see Appendix Vol. II. Pottery Report, Cd. 5219) even allowing for experimental error lead sulphate was more soluble than white lead or litharge. It was perhaps necessary to point out that the speaker was not personally interested in the manufacture of basic lead sulphate, so that his remarks could not be influenced by any bias. The most important aspect of the question was brought to light when one considers the dangerous position to which the painter was exposed if he relied on some of the current statements in which basic sulphate is regarded as being harmless. The experiments of Dr. Goadby had afforded an explanation to white lead manufacturers as to why the old practice of giving sulphuric acid drink was useless, and in many works this had been abandoned. The blue line on the gum was no positive proof of lead poisoning, and the English Home Office no longer regarded this line as absolute proof of lead poisoning. The blue or black line was found to result from contact with the products of other metals, and was not observed in workers who took care of their teeth. The speaker was interested in Mr. Line's remarks as to the toxic fumes. The author had stated that Professor Baly, of Liverpool, had been able by chemical and spectroscopic tests to show

that white lead gave off toxic emanations. All that Professor Baly had shown was that volatile products were formed during the drying of linseed oil as contained in the paint; but it was impossible either by chemical or spectroscopic methods to determine that such vapours were toxic in their effects. This feature must be reserved for animal experiments, and, further, the practical conditions must be borne in mind in such experiments. Professor Baly had last year read a paper in which he showed that white lead (not basic sulphate nor zinc white) gave rise in the course of drying to volatile products, and definitely stated that these volatile products contained lead. As a sequel, however, the Professor had read another paper, in which he had said, "The greater the improvements in the analytical method the less lead was found, until none was found, in the volatile products." That was important, because it showed that the vapours from white lead did not contain lead. Years ago Mulder showed that acetic and formic acids were present in the vapours produced in the drying of linseed oil, and Mr. Reid (Journ. Soc. Chem. Ind., 1898 (17), 75) had recorded that there was considerable loss of weight through volatile products in the oxidation of linseed oil. Genthe (Zeits. fur. Chem., 1906 (19), 2,087) stated the volatile products formed in the drying process are equal to 15 per cent. of the weight of oil. In his second paper Professor Baly recorded that volatile products are produced by zinc oxide and basic sulphate of lead, though not at the same rate as is observed with white lead. The formation of volatile products during the drying of linseed oil has been long established, and could be easily seen by investigations as to the change of weight observed in the process of drying when it is found that the increase in weight by no means agrees with that demanded by the theoretical oxygen absorption. The observed increase is invariably much lower whilst volatile products can and are readily collected. Professor Baly also recommended the use of zinc oxide, basic sulphate without a drier, because he found that a drier increased the quantities of volatile products. The speaker asked members to imagine a shop in the Strand painted with zinc oxide without driers, and suggested that it would be a pleasing sight in a couple of days. It was necessary when considering such questions to bear in mind practical conditions, because, after all, paint was essentially an article for commercial application. Great stress had been laid on the French experiments, but he thought that while the report was interesting, if not also amusing, it could not be regarded as a serious contribution to science, and it had by no means killed the white lead industry. As Mr. Line had pointed out, experiments were therein recorded stating that the volatile compounds from white lead paint contained lead. Here, again, the speaker must protest against the author's methods in dealing with evidence. He was either not familiar with the French evidence, or for purposes of his own had omitted to mention that Professor Trillat, using his own reagent, was unable to find lead present in the vapours of paint, and, as previously stated, Professor Baly had corrected his earlier conclusions. The author had also gone astray with regard to the oxides of lead, and he had described massicot as litharge, showing that he did not distinguish between two very different products, which were prepared by different processes. With further reference to the array of figures, the speaker felt sure that those members who had been brought into contact with disputed cases realised how easy it was to get a certificate of lead poisoning, because of the difficulty of diagnosis. Medical men had within recent years progressed far towards a real understanding of lead poisoning, and this progress was particularly helpful to those whose interests lay in the handling and manufacture of lead products. This condition had not prevailed long, but the limitation of the present medical knowledge in this connection was now realised, and some very valuable work was in progress. Dr. Goadby had stated before the Pottery Commission that in a post-mortem he was unable to distinguish between alcoholism and lead poisoning unless he knew the history of the case. The history of the case often settled the disputed point. Dr. Goadby a month or two since gave a demonstration before the Physiological Society, taking as his subject the lethal effects of turpentine, and had shown that turpentine produces effects of such a character as to seriously complicate the whole question now under consideration. Mr. Line had dwelt upon the reduction of cases in Newcastle, and the Chairman had supplied the missing link in saying that what was possible at Newcastle was possible elsewhere, a suggestion which evidently had not occurred to Mr. Line. Mr. Line had also quoted certain figures given by Dr. Kaup for Prussia, but these figures represented 1904, before the regulations for painters were introduced. Mr.

Line, however, omitted to state that four years later, after the introduction of regulations, the total number of cases had fallen from 391 to 259, and the number of days of sickness from 12,246 to 6,211. This great reduction showed not only a decrease in the total number of cases, but a diminished intensity of the sickness. It was obvious that incomplete figures gave a distorted view of the real position. Lead poisoning could not be completely wiped out except by prohibition. It must remain a trade risk, but it had been shown that by the application of reasonable regulations it could be reduced to an ordinary trade risk. There was no necessity to make those regulations such as would harass the employer or employed. The Chairman had indicated that considerable loss of life took place in other occupations, and had instanced railway workers. The speaker might state in this connection that the Amalgamated Society of Railway Servants had issued certain figures showing that annually one shunter was killed in every 428, and that one in every 150 was injured, exclusive of railway accidents. In the opinion of the speaker there was little disposition on the part of many of those who claimed to be interested in the paint question to grapple with the real difficulties—they contented themselves with some few obvious truisms and many generalities. Such an attitude was fatal to progress, and only hampered those who desired to obtain a solution of the problem in a scientific manner. As an instance of oft-repeated half truths, one heard constantly that lead was blackened by sulphuretted hydrogen—true; but that zinc oxide was not affected—half a truth. Zinc is affected by sulphuretted hydrogen, but as there is no colour change it is not so obvious. The obvious blackening of lead was frequently quoted as a reason why lead should not be used in large cities; thus the effect of the most important agent of destruction—namely, sulphur dioxide, produced from the burning of coal—was ignored. The speaker quoted this as one instance of the present unsatisfactory state of affairs, and felt most strongly that the only solution of the problem would be the carrying out of a series of large scale trials on impartial lines. The American results were of doubtful value to England, owing to climatic differences, but indicated lines on which an English inquiry might be based. It would appear that in the future it will be necessary in considering the toxicity of paints to take into account the effects of the volatile products formed during drying, not only the linseed oil products, but products from volatile thinners used.

Mr. Noel Heaton said he would have liked to have heard some information about antidotes. He gathered from Mr. Klein's remarks that drinking dilute sulphuric acid had been shown to be useless, and he would like to know what was now considered the best practice as regard antidotes. He believed that some writers advocated potassium iodide, but he could not himself see how it could have any beneficial action.

Mr. Klein here interposed that milk was now the recognised antidote. It formed compounds with the lead which were insoluble. Some firms also used tablets of sodium sulphide, producing lead sulphide, which, although somewhat soluble in acid, soon established a state of equilibrium.

Mr. W. A. Humfrey spoke as a visitor and a white lead manufacturer. He said that there was no reason why the protection of the painter from lead poisoning should take the form of drastic or irksome rules and restrictions. Very simple precautions and regulations should be sufficient to accomplish a great improvement in health conditions. Prohibition was the most childish and foolish remedy imaginable. Surely, if the use of lead was necessary it was impossible to prohibit it, and if it was not necessary then the painter would not use it. In lead works casual employment particularly was objectionable, and the best records were of those works which could keep their men week in week out. The speaker appreciated the fact that this was a real difficulty in the painting industry, but thought it could be largely eliminated. He was certain that a vast improvement could be made in the health conditions of the painting trade if casual labour was reduced, and reasonable precautions taken and ordinary safeguards enforced and observed.

Mr. Line, in replying to the discussion, agreed with the President that it is ignorance that leads to white lead being used for decorative purposes in London, Sheffield, or Birmingham. Far from the figures quoted being so old as to be little guidance, he had carefully brought them up to date; and the more recent figures indicated no decrease of cases amongst painters, because they, as a class, were still exempt from the provisions of the Factory Acts. No doubt, however, the slight increase in the number of cases was partly due to increased trade activity. The lead worker's condition had been vastly improved as regards factory operatives, but

not as regards house-painters. His experience, supported by many others, was that toxic fumes are given off by white lead paint, but he had not dwelt at length on the evidence of Professor Baly, because that gentleman was about to issue a paper on that subject himself. (The paper was published in the *Journal of the Society of Chemical Industry*, June 15, 1912.) Medical testimony was said to agree that females carry lead in their system for many years. To say that lithopone is no substitute for white lead was incorrect, as everything depended upon the thinning materials and drier used. That is to say, lithopone must not be thinned with raw oil, like white lead, but with prepared drying paint oil and soluble cobalt drier, with very little turpentine, and some varnish in the final coat. Three coats of zinc oxide paint, suitably thinned, were sufficient for a durable protective coating, even in an ammonia and sulphuric acid works adjoining a gasworks, and his personal experience of the durability of water-paint on exterior exposed wall surfaces was that its superiority over white lead paint had been fully demonstrated. Lithopone had been used mixed with white lead, in about equal proportions; and, when suitably thinned, was satisfactory; also a mechanical mixture of lithopone and zinc oxide had been made into admirable paint, which proved durable, and did not discolour, after white lead paint had gone chalky, and turned almost black, when subjected to fumes from locomotive engines that were frequently standing in an adjoining railway cutting. It had been said that 7 grains of zinc oxide would kill a rabbit; that might be the case with intravenous injection, but if used externally it might save the animal's life. He would say that oleate of zinc had been found an excellent remedy for the skin. The subject, he felt, required thrashing out, but the essential point was that all concerned should be induced to acquaint themselves with the best methods of avoiding the evils to which so many workers were exposed. In reply to the question bearing upon the term zinc white, he, like Sir Thomas Oliver, had described zinc oxide as zinc white; it was so well known by that name that there was a tendency to fall into the use of the words. He had tested some so-called zinc white (procured by a Birmingham painter), and had found it to consist largely of barium and a little zinc sulphide, with some carbonate—he should judge whiting; there was no lead carbonate, as he had tested the material with sulphuretted hydrogen. He appreciated some of the remarks made by Mr. C. A. Klein, but did not feel free to express in public his opinion about the probable action of the Departmental Committee on the evils attending the use of lead compounds. He, like Mr. Klein, had been called as a witness. The alleged inaccuracies imputed to Sir Thomas Oliver in his report to the Bureau of Labour, Washington, and to the author in his paper, were the result of misunderstanding, as would appear on more careful reading of the published reports. He had not stated that lead was mined in a metallic condition, but that the lead ore that is mined is either galena (the sulphide) or cerussite (the carbonate). And he had pointed out that the high rate of mortality was attributable, amongst British lead miners, to gunpowder fumes, foul air in confined huts, and pulmonary affections, through exposure when fatigued and perspiring to the cold winds of our northern climate, rather than to the inhalation of lead sulphide dust. He considered that it was misrepresenting Professor Baly to make him say that he recommended the use of zinc oxide or basic lead sulphate without the use of a drier, instancing the condition of a shop in the Strand treated thus. Of course dust would rapidly settle upon the tacky paint. What Professor Baly did say was: (1) There was danger in any hydroxy compound being used; (2) it was desirable not to use white lead paint; (3) it was advisable, in any closed room, not to use driers on account of the oxidation process of the same, and the danger was reduced to a minimum with zinc white (the oxide) and basic sulphate of lead. But he (Mr. Line) had carefully avoided misrepresenting Professor Baly, when writing this paper, though he feared some of the speakers had inadvertently done so. (Quoting from a letter of Professor Baly, "I definitely stated that from the samples of white lead used by me, i.e., hydrated carbonate in oil, a certain amount of vapour was given off which exerted a powerful absorption of light, and that it also appeared that this emanation is poisonous.") The details of Dr. Kenneth Goadby's experiments on the solubility of lead with human gastric juice may be read in the *Journal of Hygiene*, Vol. IX., No. 1, April 1909, page 129. The same medical expert's experiments with white and red lead dust are described in the Report of the Departmental Committee on Lead in the Potting Trade, Vol. II., appendices, page 56, published by H.M. Home Office, London, in 1910. He had

made no pretension to being either a metallurgical or chemical expert, but he had not described massicot as litharge. And as to the suggested unreliability of the Home Office statistics of lead poisoning, because it was an easy matter to get a certificate from a medical man, the argument in no way weakens the case against lead. Doctors report only cases that they come across in their practice, if the sufferer has been working in a factory; not otherwise. But the mere fact that the Tariff Insurance Companies demand 50s. per cent. to cover the risk of claims under the Workmen's Compensation Act shows that house painters are exposed to the gravest risks. The reduction of the number of cases of lead poisoning in Newcastle is a credit to the white lead makers, but that does not indicate any means of lessening painters' dangers. It is by observing Factory Act rules that lead operatives are now less exposed to danger, but no such rules can be applied to painters, for the Factory Acts do not protect house painters. Mr. Line was thankful for the reminder that zinc sulphide (white) was formed by the action of the sulphurous fumes in the air of manufacturing towns, when oxide of zinc paint was exposed; but here, again, it is because suitable protective, prepared, drying paint-oils and varnishes have not been used as thinners as it should be (samples were produced). Dr. Klein's reference to the figures furnished by Dr. Edgar L. Collis demand notice. Whatever reduction in the number of cases of plumbism or of days of sickness have been reported since 1904, no such reduction applies to cases in the house-painting trade. But much that Dr. Klein had brought forward was valuable information. It was stated by Mr. Heaton that the analyst should have considered and described antidotes, but he (Mr. Line) had referred to preventive and curative treatment as within the scope of medical men, and he considered that medical examination is most desirable in the paint-making and painting trades. He also quite agreed with Dr. Klein's remark that milk is a good antidote, also cocoa, and that food should always be taken by all lead workers before commencing their day's labour. He was grateful to Mr. W. F. Reid for pointing out that lead was absorbed, like mercury, by admixture with the fatty secretions in the perspirations which are evolved through the pores of the skin. Mr. Reid rightly remarked that painters handle lead much more intimately than workers in lead factories do now under existing conditions; also that lead-oleate dust, due to rubbing down, causes danger to coach painters. He agreed with Mr. W. A. Humfrey's appeal to master painters, and those in a position to control painting, to limit the danger so far as possible. He also referred to the strong recommendation addressed by himself to the Paint and Varnish Society in the first section of his paper, to forestall the Report of the Departmental Committee on lead poisoning, by promptly approaching the members of the painting trade, in order that drastic action, in the nature of precautions, should be taken by painters generally, to minimise the terrible risks of lead poisoning.

On the motion of the chairman, a hearty vote of thanks was passed to the author, and the proceedings terminated.

THE BRITISH FIRE PREVENTION COMMITTEE.*

THE term "fire prevention" is, I am afraid, too often misunderstood, inasmuch as fire extinguishing or, rather, fire brigade work is what the majority has in its mind, and many Town Councils consider themselves well protected if they can boast of an efficiently-manned fire-engine establishment.

In reality, however, fire brigade work, as such, occupies but a secondary rôle in the several systems of fire protection, for really well-protected towns must owe their position in the first place to properly applied methods of fire prevention—namely, preventive legislation and a preventive practice based on the experience and research of architects, surveyors and engineers, fire brigade officers, insurance and municipal officials.

Fire protection, as generally understood during the last decade, is a combination of fire prevention, fire combatting, and fire research; and under the heading fire prevention all preventive measures are classed, including the education of the public.

Preventive measures may be the result of private initiative; but as a rule they are defined by local authorities and contained partly in Building Acts and partly in separate

codes supplemented, if necessary, by rules for the treatment of extraordinary risks, such as the storage of petroleum, the manufacture of explosives, or the performance of stage plays.

The work of the British Fire Prevention Committee relates in the first place to prevention pure and simple, and in the second place to research, whilst what is generally termed fire-combatting or fire-extinguishing only takes a third place in its sphere of activity. Mutual interest naturally brings the committee closely in touch with those who have the actual fire fighting to supervise—namely, the officers of professional, part-paid, volunteer, and private fire services, for just as no fire brigade officer who desires to keep up to date fails to carefully study questions of prevention, so does no municipal engineer, surveyor, &c., fail to become thoroughly conversant with the principles of fire-service work and equipment.

As fire brigade officers in different countries are banded together to discuss subjects relating to fire combatting and to exchange experience, so in England architects, engineers, district surveyors, municipal officers, and the members of the other technical professions interested have joined hands to deal with that part of the general subject of fire protection—namely, fire prevention—in which they are mainly interested. And just as the associations of fire brigades include frequently members of the technical professions who are interested in fire brigade work, either from an engineering, scientific, or some other point of view, so many of the superior professional fire brigade officers and many of the leading volunteer officers actively co-operate with the British Fire Prevention Committee, whose work not only so materially affects the fire hazard of the areas they attend, but, in fact, plays a very important rôle in the safety of public life, and the fireman's life in particular.

Thus I would put to you that if you in Russia, or those who have influence in other countries, can either constitute committees such as ours, or get your fire service societies to systematically develop the fire preventive side of fire protection, you will be benefiting your respective countries and your own technical and fire services. In order to give you some idea of how a committee like the British Fire Prevention Committee can be formed, I propose to give you some particulars of its formation and methods.

The Committee's Formation.—The British Fire Prevention Committee was formed by Mr. Edwin O. Sachs, F.R.S.Ed., after the Paris Charity Bazaar fire of May 1897 and the great Cripplegate fire in London of November 1897, on both of which cases it was obvious to the world that the subject of fire prevention was really in its infancy.

The committee was formed first as an ordinary private society, afterwards developed into an incorporated committee, and now has a membership of some four hundred professional men. The necessary funds for the ordinary secretarial work were raised by a regular annual subscription among the members, and by voluntary contributions of members primarily interested, and latterly regular subscriptions have been obtained from public authorities and others.

A council of influential members was formed, an executive, and also a number of sub-committees, and a small staff of assistants were engaged—namely, an assistant secretary, engineer, and clerk—as much of the work as possible being done by voluntary effort.

The objects of the committee are as follows:—

1. To direct attention to the urgent need for increased protection of life and property from fire by the adoption of preventive measures.
2. To use its influence in every direction towards minimising the possibilities and dangers of fire.
3. To bring together those scientifically interested in the subject of fire prevention.
4. To arrange periodical meetings for the discussion of practical questions bearing on the same.
5. To establish a reading-room, library, and collections for purposes of research, and for supplying recent and authentic information on the subject of fire prevention.
6. To publish from time to time papers specially prepared for the committee, together with records, extracts, and translations.
7. To undertake such independent investigations and tests of materials, methods, and appliances as may be considered advisable.

To what extent the committee has acted upon these objects it would be out of place for me to speak, though I may mention that good hard work has been done by all concerned in its organisation, and that by its popularity among well-educated and technical men, both at home and abroad, it

* A Paper by Mr. Horace S. Folker, F.A.I., Sutton, England, Member of the Executive of the International Fire Service Council, read before the International Fire Congress at St. Petersburg.

seems to have met with the favour of those who are interested in the subject in hand.

Testing Operations.—The tests which have been instituted by the British Fire Prevention Committee have been largely limited to obtaining reliable data on the exact fire resistance of various materials and systems of construction, or appliances used in actual building practice in Great Britain; in other words, they have been limited, so far, to obtaining results bearing on the every-day practice of the building world rather than to dealing with theoretical work.

The reason for these investigations is that sufficient data do not exist as to our methods of building construction, and that the little information available has, to a very considerable extent, been obtained by individual makers or manufacturers in their own laboratories, and that the results thus obtained have not been met with much confidence.

The few official tests that have so far been undertaken in the United States and in Germany have not, so far, been systematically organised, but have simply had the object, as a rule, of dealing with certain specific questions or a certain specific piece of material employed in a particular building rather than of treating the question of fire prevention as a whole.

The series of tests undertaken by the committee hence not only fills a long-felt want, but gives the fire prevention trades an opportunity of obtaining authentic records as to the reliability of their work.

Latterly the testing operations also include tests with fire appliances and with fire-resisting materials in popular use, such as textiles, but this is somewhat of a new departure.

The tests are of an entirely independent character, arranged on scientific lines, but with full consideration for the practical purpose in view. Absolute impartiality is assured, records being mostly taken automatically and by photograph, while the temperatures are carefully regulated and maintained, as the means for applying heat is by the combustion of gas.

All reports on tests solely state the bare facts and occurrences, with tables, diagrams, and illustrations, and on no account include expressions of opinion, nor should any phrase be read as a comparison or criticism.

The general arrangement and direction of the tests is in the hands of the Executive, and in accordance with certain principles laid down after careful study and experiment.

The actual tests are attended by the members of the Council and the members of the committee in rotation, care being taken that the attendance is always thoroughly representative of the technical professions primarily interested in the specific object under investigation.

The present testing station is near Regent's Park. The premises comprise an old villa residence and garden. The principal rooms are used for committee and reception rooms, a museum, laboratory and photographic dark-room, and a residence for a caretaker. The garden is occupied by the huts in which tests are conducted and the necessary plant.

With regard to the financial aspect of the station, the cost was met by special loans from individual members of the committee.

Tests with patented materials, makers' systems, &c., are subject to a scale of charges so regulated as to only just cover the actual cost. The testing station is also open to members for such private research work or tests as they may desire to undertake, at nominal charges for the loan of plant and instruments. The service of the members participating in the management of the station, conducting or attending tests, are given entirely gratuitously, and no out-of-pocket expenses are refunded. About £25,000 has been spent on the testing work, comprising some 200 tests spread over twelve years.

The Committee's Plant.—The plant actually completed comprises a set of testing huts, in which floors, partitions, doors or ceilings can be tested. The huts are laid down in two rows, and the materials used in their construction are stock bricks with lime mortar.

The fuel used is gas, produced on the spot by a generator. The gas is conveyed from the generator by pipes to the several huts, and the supply is regulated by valves and dampers; and as the gas enters the huts from the branch pipes it is diffused by means of mixing chambers of fire-brick.

Each hut has door openings, ventilation, and observation holes, the doors being closed by brickwork during a test, and the ventilation holes blocked according to requirements by fire-brick or fire-clay.

Each chamber for a floor test allows for the floor under investigation to be placed at least 8 feet above the floor of the

hut, and the chambers are roofed in with galvanised iron or tarpaulins when necessary.

Bricks of concrete blocks are used for any loads that may be applied to floors under investigation, and water is applied from an ordinary manual pump equipped with pressure gauge.

Records.—Temperature records are taken, as far as possible, automatically, by electrical pyrometers designed by Professor Roberts-Austen, of the Royal Mint, and are able to record temperatures up to 2,500 degs. Fahr.

Visual observations of work under investigation are also recorded, as far as possible, by photography.

Deflections are measured by level and staff or by weights and pulleys.

Attendance at Tests.—The general arrangement and direction of the tests, as already explained, are in the hands of the Executive, the work being done according to certain principles laid down by them after careful study.

Attendances at tests have to be strictly limited in accordance with the regulations of the testing station, for, quite irrespective of the fact that any crowding disturbs those directing the operations, and that the actual attendance is by no means free of danger, there is the question of vibration; for instance, the movements of people in the house are distinctly felt on such delicate instruments as pyrometers.

For the regulation of the attendance at tests, with due consideration for the representation of the committee—and also of the exhibitor, should it be the case of a patented piece of construction, system or appliance—detailed by-laws are in force.

Every test is in charge of a special sub-committee of the Executive, of whom one acts as the directing member. The complete technical direction is in their hands, and each member of the sub-committee wears a distinguishing badge when on duty.

For the execution of any one test the officers and employees of the committee take their instructions only from the directing member of the sub-committee in charge of that test, and are responsible to him for their due execution.

The Committee's Own Investigations.—Tests of fire resistance of the ordinary building materials or forms of construction which are not subject to any patent or the interest of any special maker, are undertaken from time to time according to the means at the disposal of the Executive for such purposes. It rests with the Executive, either of its own initiative, or at the instigation of others, to arrange for tests of this description, and it is hoped that the various public authorities interested in the subject will, in due course, contribute financially towards the cost of such experiments as they may consider of general public utility.

Up to the present the Executive has tested numerous floors of various construction, as well as many doors and partitions that are in common use. It is needless to say that there are endless questions relating to the fire resistance of ordinary forms of construction that have yet to be solved, and it is hoped that further research will be made in this direction as means permit.

The Executive hopes, in due course, to be able to record the exact resistance of all the more common methods of construction used in the British Isles.

Makers' Official Tests.—As already indicated, quite irrespective of the tests undertaken by the committee with work not subject to patents, or not the speciality of individual makers, the fireproofing trade also has every opportunity of obtaining official and independent reports on its systems or appliances at a fixed tariff.

Before any test with any materials, systems or appliances is started, or the arrangements for such a test are commenced, all contributions shall have been paid in advance, and the ordinary application for a test has to be supplemented by an undertaking on the part of the firm or individual desiring the test to accept all or any reports of the committee, framed on the lines indicated above, and further, to permit the Executive to issue such reports.

Reports.—In framing the reports issued by the committee, it is well again to emphasise the fact that every possible precaution is taken in wording them to avoid any semblance of opinion or comparison. They are drafted solely as a record of facts, and are intended to be read as such.

In the case of makers' tests, the exhibitor has an opportunity given him to put any grievance before the Executive prior to the issue of the report dealing with his individual test, any observations on his part receiving full consideration.

The reports are published at the direction of the Executive, and they are not only distributed among the

members of the committee, but among such non-members as is thought advisable, including the officials of the leading public offices.

In conclusion.—I have entered into detail as to the testing station, for I believe this feature of the committee's work specially claims attention in Russia. This has prevented me from even touching upon other spheres of the committee's work, such as its influence on question of technical legislation, its publication of interesting records of great fires, its collection of statistics and other data, its preparation of detailed reports on the fire protective organisation of other countries. Its work included a fire preventive campaign in connection with the recent Coronation celebrations, a great Congress in 1903, an International Fire Exhibition at Earl's Court, just to mention a few items.

The total accomplished is great, yet with greater funds a yet vaster field might easily have been covered.

I would now propose my resolutions:—

Resolutions:—

1. That the Congress deem it advisable that every civilised country have a society, committee, or institution having objects similar to, and doing work similar to that done by the British Fire Prevention Committee.

2. That such societies, committees, or institutions should be formed of members unconnected with any trade or industry concerned in fire-appliance or fire-resisting construction, and be duly incorporated with an unalterable proviso of this character.

3. That such societies, committees, or institutions, when rationally formed and representative of the technical professions primarily concerned, merit the regular substantial financial support of their respective governments, having regard to the great economy in the national wealth, and conservation of life and property that must result from fire preventive work systematically advocated and developed under the guidance of such bodies.

4. That the constitution of the testing station and successful work of the British Fire Prevention Committee should serve as a basis for the formation of similar societies, committees, or institutions, having regard to the eminently effective record of how the fire loss of England has materially decreased since the existence of the British Committee.

The above resolutions were unanimously adopted at the Congress, which comprised some 1,200 members representative of fifteen different countries.

COMPETITION NEWS.

DUNDEE.—The School Board have decided to invite competitive plans for a new school. The cost of the proposed building is estimated at £4,000.

EDINBURGH.—The Executive Committee of the Scottish National Memorial to King Edward VII., which is to be erected in the vicinity of Holyrood Palace, met in Edinburgh on Tuesday last, and approved the design submitted by Mr. George Washington Browne, R.S.A., Edinburgh. It will be remembered that seven Scottish architects were asked to compete, but that three declined the honour. Two others were appointed in their room, leaving six on the list. These were Mr. Hippolyte J. Blanc, R.S.A.; Mr. Washington Browne, R.S.A.; and Sir Robert Lorimer, R.S.A., all of Edinburgh; Mr. John J. Burnet, LL.D., F.R.I.B.A., and Mr. Henry E. Clifford, F.R.I.B.A., of Glasgow; and Mr. Robert J. Macbeth, Inverness. Shortly after his design was lodged Mr. Macbeth died suddenly. Seven designs were actually received, one of the competitors having lodged two sets of plans. Mr. Browne's design is briefly that of an enclosure of the courtyard in front of Holyrood Palace, with a stone gateway at the Canongate entrance and Doric colonnades at the south and north ends, that at the south to form a site for the monumental part of the memorial. The successful design has the approval of King George, who made certain suggestions with a view to improving it. The bronze group of King Edward receiving a wreath of laurel from Peace and Concord will be the work of Mr. Alfred H. Hodge, of London. The whole cost of the memorial is estimated at £15,000.

FLEET.—Mr. H. Percy Boulnois, M.Inst.C.E., &c., has presented his report as assessor to the Fleet Urban District Council on three competitive schemes for the drainage of the district. The scheme recommended for adoption is that prepared by Mr. T. J. Moss-Flower, C.E., of Westminster and Bristol, which is estimated to cost £29,732. The unsuccessful schemes were sent in by Mr. Mackenzie Richards and Messrs. Lemon & Blizzard.

GLASGOW.—The Corporation last week considered the general conditions, &c., for the competitive designs to be invited from outside architects for the proposed extension of the municipal buildings, a report of which appeared in our pages last week, Supplement, p. 18. After some discussion it was agreed to eliminate Clause 5, which reserved to the Corporation the right on the advice of Dr. J. J. Burnet, their assessor, to invite not more than three well-known architects who may not have submitted designs in the first competition to join in the final competition. Exception was likewise taken to a clause in the conditions which provides that if no instructions are given to the architect to proceed with the building within twelve months from the date of the assessor's award in the second competition, then the architect shall receive payment from the Corporation for his services in connection with the preparation of the competition drawings of a sum equal to 1½ per cent. of £150,000, the estimated cost. It was moved and seconded that the clause be sent back, in order that instead of making payment of £1,800 upon the estimated cost, a definite fee be fixed for services rendered. Mr. Carlton defended the minute. He pointed out that by the time they reached the stage when it was proposed to pay 1½ per cent. the architect would have done a great deal of work, and he was entitled by law to receive payment. The condition was set forth in the minute to make the terms of the competition perfectly clear to the profession. The Corporation was always willing to pay the labourer for his hire, and if they got so much work from the architect he did not think they would object to pay for what they received. Finally it was decided that, instead of paying a commission on the estimated cost of the building, they fix the sum of £500 as the amount payable to the architect in the event of the building not being proceeded with within twelve months.

MANCHESTER.—It has been decided to select the plans submitted by Mr. Alfred Rigby (of the firm of Messrs. Lowther & Rigby, of Hull and Manchester) for a proposed Roman Catholic Church to be erected at the corner of Richmond Grove and Plymouth Grove, Longsight. Three architects were invited to compete.

THE UNIVERSITY OF LIVERPOOL.

The examination lists of the Faculty of Arts School of Architecture have now been published.

Degree of B.Arch. (second examination).—S. H. Lakshminarasappa, A. R. Sykes.

Certificate in Architecture.—(The names in each class are in alphabetical order.)

First Class.—R. F. Dodd, S. A. Harper, S. S. Jones, S. H. Lakshminarasappa, A. R. Sykes, W. H. Thompson.

Second Class.—S. Faraday, G. N. Hill, S. P. Mehta, J. W. Rutledge.

The following awards are made:—The Holt Travelling Scholarship, W. H. Thompson; the Ravenhead Entrance Scholarship, F. Jenkins.

Students who obtain a first-class certificate are exempted from the intermediate examination of the R.I.B.A.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

John Thompson & Co. v. Thompson.

SIR,—From the report of this case given in your paper it would appear that we had employed no foreman on this work.

Will you kindly allow us to correct this, and to say that whilst we did not consider it right to saddle our client with the expense of a "walking" foreman, we had in charge of the work a trustworthy "working" foreman, such as we are accustomed to employ on work of this nature, whether contract or daywork, and in whom we have the utmost confidence?—We are, yours faithfully,

JOHN THOMPSON & CO.

43 Wood Street, Peterborough:

July 5, 1912.

The General Purposes Committee of the London County Council recommend "That applications be invited by public advertisement for the position of chief engineer of the Council and county surveyor for the administrative county of London at a salary of £22,000 a year, and that members of the staff be not precluded from making application for the position."

The Architect.

NEW HEAD OFFICES FOR PORT OF LONDON AUTHORITY.

THE design of Mr. T. Edwin Cooper, which has been selected and accepted in the important competition for the new Head Offices of the Port of London Authority, well merits the position it occupies, both in respect of its general disposition and lay-out of the site and as regards its detailed arrangement of plan. The site, ample in area and demanding the reservation of certain spaces for development as a building estate, was nevertheless not a very easy one with which to deal on account of the restricted frontage to Trinity Square and the awkward angle which this makes with the natural axial lines. It was obvious that for the best development of the spare land the Port of London building should have its main lines square with the natural axes of the land acquired by the Authority. On the other hand, the principal elevation should obviously face Trinity Square on a line at an angle closely approximating 45° with these, and the first problem that competitors had to solve was the reconciliation of these opposing desiderata.

In the final, as no doubt in the preliminary, stage of the competition, most of the participants in the struggle placed one or other of the obvious requirements in the forefront and made it a determining factor in the general conception of their plan. Mr. Cooper has solved the problem by the simple device of planning his building as a hollow square with its sides parallel to the natural axes of the site, and cutting off one corner of the square at an angle of 45° to give the obvious elevation to Trinity Square. A perfectly simple solution, like that of Columbus with the egg, when you are shown how to do it, but not one of the other five of the competitors in the final round has adopted it, and we must believe that these five submitted better plans than any of the numerous contributors to the first open stage of the competition. Two of these five make their axial lines north and south, parallel to those of the land, the other three north-west and south-east, governed by the elevation to Trinity Square.

Not only does Mr. Cooper's disposition satisfy the conflicting desiderata, but it gives for the principal façade, facing Trinity Square, a good opportunity for a different and more important treatment than the other four sides. Thus the columnar order, which a great public building always demands as an expression of dignity, is sufficiently and readily provided on the principal entrance façade, whilst the other elevations can receive an astylar treatment, far better suited for the effective lighting of a number of offices, many of them small private rooms for single officials. The building as arranged by Mr. Cooper has, therefore, its principal front to Trinity Square, its

eastern face to a widened Savage Gardens and its other elevations to new roads.

In the internal planning of the building arose a second problem for the competitors, the provision of very large rooms for clerks and public offices and of a large number of very small rooms for certain officials. Mr. Cooper's solution of this problem is to make the sides of his hollow square buildings 45 feet wide internal dimension, divided by a central corridor, lighted mainly by borrowed light. Then the large rooms can be made long and comparatively narrow, or on occasion when necessary the full width of 45 feet with light both sides. Herein comes the merit of the hollow square, the internal sides have splendid light for the internal square is large.

Most of the other competitors have their internal courts or areas so restricted that only corridors can be adequately lighted therefrom. Mr. Cooper places on the ground floor a circular hall for the Port Rates office, which complies with the suggestion of the competition particulars that a large hall should form a feature of the ground floor, and as it is of one storey only in height, on the upper floors the internal quadrangle gives a magnificent light to the rooms looking into it; indeed, the inner rooms will have a better light than those on the external fronts of the building.

Mr. Cooper's ground-floor plan may be thus summarised: on the south-east angular front a stately entrance hall or series of halls, on the north and west sides of the hollow square the Dock and Warehouse offices, on the east side the Chief Collector, on the south the Deposit office, and in the centre of the square the circular Port Rates office. No palatial grand staircase, but a sufficiently important and practicable staircase at each of the five angles. The whole plan has that unmistakable air of well-ordered simplicity which marks the skilful design thoroughly worked out to perfection, whilst most of the others suggest that their authors were tired of the job before they finished.

In external treatment Mr. Cooper has made his principal façade monumental by the use of a detached colonnade, three storeys high, on a rusticated ground floor with circular headed openings. The feature to be seen from the river suggested in the competition instructions is provided by a two-storey tower on a wide-spreading base, which is too obviously an extraneous feature, and has no satisfactory organic connection with the rest of the design. The remaining elevations follow the principal front with a rusticated ground floor, three storeys above, a cornice and an attic, rightly suggestive of an important block of offices.

A curious and mysterious affectation of secrecy is main-

FROM SKETCH SUBMITTED BY MR. C. PEAKE ANDERSON FOR PUGIN STUDENTSHIP, 1912.

tained at the River Office of the Port of London Authority with regard to the identity of the authors of the remaining five designs in the final stage of the competition. As the names of the whole six competitors have been widely announced it is not difficult to recognise the respective authorship by the draughtsmanship, but we will speak of the designs by their affixed numbers.

No. 2 has the building planned in rectangular form on the eastern side of the land, the front lining with Trinity House and the rear extending to Crutched Friars. A wide open space in front reduces the available building land to small dimensions. The feature of the plan is a great central hall, occupying in height the ground floor and three storeys above, treated in three bays with glazed domes over, and occupied as the Port Rates office. The corridors of the upper floors look into and are lighted from this great hall, which is a very fine conception. The entrance front is treated to a colonnade; the others are astylar, and a well-designed square tower is an important feature of the exterior, the author having thus

made the fine hall and a feature visible from the river, important elements of the design.

No. 3 adopts a fan-shaped disposition of the block, with a crescent road at the back and the main axial line passing through the centre of Trinity Square, to which the principal elevation faces. A feature of the plan is an oval hall on the main axis, approached by an imposing series of minor halls. As a practical solution of the problem the plan suffers from the defective lighting of many offices from narrow internal areas. Convenience has, in fact, been sacrificed to effect.

No. 4 has a rectangular block athwart Trinity Square, with the major axis lining to its centre. The entrance leads to a grand staircase hall and through to the Port Rates and Dock and Warehouses offices, which are combined, and have their practicable entrance from the rear.

No. 5 suggests a drastic remodelling of Trinity Square to fit a rectangular block which, like that of No. 2, lines with the front of Trinity House and extends back to Crutched Friars. Secondary entrances only are arranged

FROM SKETCH SUBMITTED BY MR. C. PEAKE ANDERSON FOR PUGIN STUDENTSHIP, 1912.

at the north and south ends, the main entrance being at the side, with a grand hall and staircase. A bold high tower is a well-designed feature of the front to Trinity Square, but cuts the elevation in two.

No. 6 most nearly approaches Mr. Cooper's plan, having a hollow square with central hall, but this latter is carried up to the second floor, and has accommodation over it on the third and fourth floors, instead of being in one storey only, as in Mr. Cooper's plan. The square block has its principal axes north-west and south-east, so that the lines of the plan are square with the front to Trinity Square. This plan has many irregular shaped rooms. We shall illustrate Mr. Cooper's design next week.

NOTES AND COMMENTS.

THE participation by their Majesties the King and Queen in the thanksgiving service held at Winchester on St. Swithun's Day, 819 years after the consecration, marks the completion of the renovation of the foundations of the cathedral under Mr. T. G. Jackson, R.A., and credit is due to the ability with which Dean Furneaux and the Chapter have raised the sum of £113,000 for the work that has been done. As we have said before, we do not admire the tactics by which the funds have been raised as a result of repeated frantic appeals for help

on the assurance, sometimes implied, sometimes explicit, that each would be the last. Still, the tactics have succeeded, and the present custodians of the cathedral have repaired the neglect of several generations of their predecessors. For the Dean and Chapter have been repeatedly warned, to our certain knowledge, for at least half a century, that something ought to be done to arrest the continued subsidence of the cathedral's foundations, and it was only when it became clear that something must be done to avoid imminent disaster that the recently completed works were commenced. As long ago as the thirteenth century serious settlements existed, and repairs were made to counteract them. Nor have the recent operations been carried out in the least costly manner. A rigorous examination of the whole cathedral and a comprehensive scheme prepared at the commencement would have made the fabric absolutely safe at far less cost.

We are not entire believers in the Greathead system of grouting. The Tube railways of London are supposed to be encased in a waterproof lining of cement by this means, but anyone may see the many evidences of penetrating damp that belie the supposition. Tons of cement and water have been pumped into the walls of Winchester Cathedral, but what has become of them nobody knows.

It is obvious that the fluidity of grout necessary to enable it to flow in a forced stream through an extensive ramification of internal fissures demands a considerable amount of water to be added to the cement. Assuming, for the moment, that the efficiency of the pumping machinery is sufficient to fill all the interstices with grout, the cement will set no doubt, but will Sir Francis Fox tell us what becomes of the water? It cannot solidify beyond the very small proportion used by the hydrated cement in crystallisation. It must either remain liquid, in which case the fissures are partly filled with crystallised cement and partly with water, or it must be absorbed by the stonework and leave vacuities after the cement has set. The latter hypothesis, knowing as we do the stone of which the Winchester Cathedral walls are built, is that we should favour. Yet, in face of such scientific certainty, the general public is asked to believe such inspired statements as that voiced by *The Guardian* in the following words: "By an adaptation of the powerful Greathead machine, used in the construction of the Tube railways, he (Mr. Fox) injected cement into loosened joints and fissures of the ancient walls, thereby transforming them in fact from jointed masonry into solid monoliths. Not the smallest crack or cavity was left unpenetrated, and the amount of cement thus used was enormous—in one corner of the north transept alone not less than forty tons were used. Now that the cement has practically hardened the walls into stone, and that the foundations on which they rest have been securely based upon the solid gravel underlying the original morass, it is hard to see what further risk can assail the building thus wonderfully preserved."

The assumption that the machine fills all interstices with grout will hardly commend itself to those architects and builders who have seen old mediæval walls in course of demolition. They know that there is a considerable displacement of the original stones and mortar. The latter has decayed and the former have slipped, and the fissures caused by subsidence are no longer continuous but blocked at intervals. Is it certain that the grout pumped into a fissure from its external opening will displace or pass these stoppages? and is it not more likely that it will fill part only of the interstices, even as grout, leaving still further voids when the cement sets and the water is absorbed by the stone? There is also the high probability that a considerable part of the forty tons of cement mentioned by *The Guardian* no longer remains in the walls but has run through a fissure or fissures extending to the base of the walls into the peat. It must be admitted that a large amount of cement has been pumped into the cathedral walls, and that it is doing service in holding masonry together, but to regard the walls as now being solid monoliths is absurd.

There is another possible danger in the filling of fissures in limestone walls with cement grout. The British standard specification for Portland cement permits the presence of sulphuric anhydride to the extent of 2.75 per cent., and many of our good modern cements actually contain about 2 per cent., some of it no doubt in combination. Therefore, when the cement sets the superfluous water is no longer pure water but a solution of sulphuric acid. What is this doing with the limestone of which Winchester Cathedral is built? Very serious trouble occurred at Winchester College in new buildings erected some years ago from the sulphuric acid percolating from concrete filling to vaulting. Can we be satisfied that the tons of sulphuric acid which have been pumped into the cathedral walls are doing no mischief?

Under the direction of Mr. W. T. Oldrieve, F.R.I.B.A., of His Majesty's Office of Works, the restoration of the roof of Glasgow Cathedral is making good progress, and very shortly the temporary ceiling will be removed and the new wooden vaulting of the choir and transepts will be exposed to view, showing the scheme of iconography that has been adopted in the

bosses carved in old oak from the former roof. In the choir roof the nine large bosses of the centre rib, along the crown of the vault, illustrate the Life of our Lord, beginning at the west end with the Nativity, and following in succession with the Baptism, Temptation, Transfiguration, Eucharist, Crucifixion, Resurrection, Ascension, and at the east end Christ in Glory. On the south side the bosses at the turn of the vault illustrate the miracles of Christ, beginning at the west end, the subjects being the Turning of Water into Wine, the Draught of Fishes, the Stilling of the Tempest, the Raising of Jairus's Daughter, the Opening of the Eyes of the Blind, the Raising of the Widow's Son, the Healing of the Multitude, the Walking on the Sea, and the Raising of Lazarus. The series of bosses on the north side of the centre rib are ornamented in a simpler manner with symbols beginning with the Dove at the west end, and proceeding with the Lamb, the Shepherd's Crook, the Chalice, the Spear, the Three Nails, the Scourge of Cords, the Crown of Thorns, and Alpha and Omega at the east end. At the wall head there is a further series of carvings. Over the eight wall shafts life-size angels bear the arms of the principal bishops of the See, beginning with St. Kentigern, and followed by Joceline, Bondington, the builder of this choir, Wishart, Blacader, who very probably decorated this ceiling. These are followed by Leighton, Macfarlane, and the present "bishop," Dr. Macadam Muir. Between these are shields with the arms of the Kings of Scotland, beginning with Malcolm and David at the east end, and followed by William the Lion and Robert the Bruce, James I. and James III., James IV. and Queen Victoria, Edward VII. and George V.

The vaults of the transepts have been decorated in a similar manner to those of the choir. The centre boss in the north transept bears the arms of Glasgow University, with, on the one side, those of the Faculty of Physicians and Surgeons, and on the other the Faculty of Procurators. At the wall-head on the east side are the arms of Iona, Culross, and Whithorn, while on the west are shields representing Dundee, Dunblane, and Dunfermline. In the south transept the arms of the Corporation occupy the central position, with on the one hand those of the Merchants' House and on the other the Trades House, while at the wallhead are the arms of Edinburgh, Melrose, St. Andrews, Paisley, Aberdeen, Ayr. The nave roof is not so far advanced towards completion, and the trusses are in course of erection for the actual roof, which has still to be constructed and covered, whilst the copper of the choir and transepts has by now lost its freshness and started to develop a green film.

GREAT AND LITTLE BOOKHAM.

(Concluded from last week.)

In Domesday Book Little Bookham is described as follows:

"The land of William de Braiose" Bocheham (Little Bookham). "Halsard holds of William Bocheham Godtovi held it of Earl Harold. It was then assessed for 5 hides, now for 3 hides. The land is for 3 ploughs. In demesne there is 1 and 3 villains and 4 bordars with 1 plough. There are 4 acres of meadow. From the pannage and herbage 11 hogs. In the time of King Edward and afterwards it was worth 50 shillings, now 60 shillings."

In an Inquisition taken on the death of Sir John Haunsard, 3 Edward I., 1275, it was found that he died seised of this manor, one part of which he held of the Earl of Gloucester by one-fourth of a Knight's fee, one part of William de Braose by a Knight's fee, and the remainder of the Abbot of Chertsey—value per annum £15.

Registers lost—1345-1366. 1415-1446. 1492-1500. 1616-1627.

Three virgates of land in the manor were held of the Abbot of Chertsey for 12d. annual rent and suit of court at Cobham and Great Bookham.

The church, about twenty minutes' walk through fields from Great Bookham, is an ancient edifice (name unknown) of stone and rubble in the Norman style, consisting of chancel and nave all under one roof, measuring 59 feet 3 inches by 17 feet 9 inches, with a small wooden belfry and low shingle spire, containing one bell.

The north and west walls of an early twelfth-century aisleless nave, to which a south aisle was added about the year 1160, are still standing, but the chancel which was contemporary with it was pulled down in the thirteenth century and replaced by another of the same width as the nave, the east wall of the nave being entirely removed. By the latter half of the fifteenth century the south aisle was perhaps in bad repair and was pulled down, the spaces between the columns of the arcade being walled up. A thirteenth-century window, no doubt from the old aisle, has been set in one bay of the blocking. At the south-east of the chancel is a piscina with two drains, probably of thirteenth-century date, over which is a four-centred cinquefoiled head with sunk tracery in the spandrels of the fifteenth century. At the south-west is a blocked window, which shows outside as a single light, with a trefoiled ogee head of fourteenth-century date. The groove for the glass and the holes for the window-bars remain in the reveals and soffit. (Victoria History.) In 1901 the church was enlarged by the addition of an organ chamber in the north aisle of the chancel; there are 130 sittings. The register dates from the year 1651. The living is a rectory, net income £330, with residence, in the gift of Henry C. Willock-Pollen, Esq., and held since 1905 by the Rev. John R. Edwards. There are charities of about £60 annual value. Mr. Morris gives the following particulars:—"It was apparently built in or about the middle of the twelfth century, and originally possessed a south aisle. This, however, was removed pro-

LITTLE BOOKHAM CHURCH.

bably late in the thirteenth century, though the old arcade (now blocked) is visible both inside and outside. There seems also to have been a small later chantry chapel on the north of the nave, to which the blocked arch (without capitals) remains. There is no chancel arch. The font is contemporary with the original church. The blocked fourteenth-century 'low-side' is visible on the outside, in the normal position." He also gives the date of the registers as from 1642—this is nine years earlier than that given in the county directory.

In that fascinating book of Mr. L. J. Jennings, "Field Paths and Green Lanes," he gives a description of how he came upon Little Bookham Church: "You see nothing of the church until you have actually opened the gate which leads to it. By the side, separated by a wall, is what is called the manor house, an ugly, but possibly very comfortable edifice. In the churchyard is a large old yew, protected by an iron railing 10 or 12 feet in height. The traces of Norman arches and capitals outside are very clear and good, and were only brought to light in 1864."

I may mention that this place (Little Bookham) is almost the centre of Surrey.

In his most interesting work on the "Forests of Surrey" the Rev. J. Charles Cox says: "Surrey was from early days one of the best wooded districts in the whole of England. The woods were so dense in the south of the county and in the valleys of the centre that the early settlers could effect no permanent lodgment until they had felled the trees and made a clearing. Woodland is entered in fully three-fourths of the manors enumerated in the Surrey survey. The survey takes little account of the Surrey strip of the Weald, there were but few manors on it, and it was mostly uninhabited forest." And he goes on to say: "As every lover of Surrey well knows, the chief woodland tract of the county is the Weald, which extends all along the southern fringe of the county. Here the soil always has been, and still is favourable to the growth of oaks, and you may also notice how the oak trees, many of fine growth, form the usual hedgerow timber of the whole of this district, and also flank the roads and by-roads. During the seventeenth and eighteenth centuries large drafts of oak were taken for shipbuilding purposes of our Navy." We read in George Clinch's work on "Bygone Surrey" that timber was supplied from Bookham (Bookham) for the building of Nonsuch Palace, Cheam.

Let me try to describe the common, and this is almost an impossibility, as each nook, glade, drive, pond, and even ditch is entitled to have something said in favour of its beauties. This beautiful and magnificent common stretches from Slyfield on the north, Leatherhead on the east, and Effingham on the west and south-west, abounding in scenery that is one of the fascinating features of our county. The trees—monarchs some of them—are in their splendour now, showing all the beautiful colours of new growth—oaks, hollies, birch, hazel, sycamore, larch, spanish-chestnut, and many others; and add to these the undergrowth, the bracken growing in profusion, bramble everywhere, the fruit of which is the delight of the children in the late summer and early autumn; and it is here we may wander in woody glades of great beauty. Oaks are the most numerous of the trees, and it is curious to note how large a number of them have their boles grouped about by free-growing hollies, while many of the smaller trees and shrubs are festooned with honeysuckle in lovely profusion. This is what it is now; but in the days gone by it must have been an impenetrable forest, with swamps, marsh and bogs; and where the hogs mentioned in Domesday Book were fattened or made lean upon acorns whose descendants flourish on Bookham Common to-day. Here the cottagers had common rights—as elsewhere—and one of the inhabitants informed me that a "round up" of cattle had occurred in his time, notice being given by the bailiff that on a certain day the drive would be made. This being done, the owners had to claim their cattle, and those not claimed were sent into Guildford, and after three days were sold in the open market, the money being sent to the lord of the manor.

Mr. Charles V. O'Neil, writing in the "Home Counties Magazine" (March 1911), on "Some Old Surrey Roads," says:—"One often hears it said that according to English law and tradition 'once a highway always a highway.' There are, of course, many exceptions to this rule or law, whichever it may be. In Surrey, for instance, the ancient track from Ockley, on the Stane Street, through Parkgate and Newdigate to Gatton, every trace of which has vanished, and equally of course any thoroughfare may be closed by means of the necessary legal process, though such changes are not frequent, except perhaps in the neighbourhood of large towns. In rural districts it is seldom worth while to close an old track, and they have been allowed to revert more or less to a state of nature, and these derelict roads are among the most charming features of the district. And here in this district you have some of these abandoned roads; you have no doubt noticed that this village lies off the main road to Guildford, and yet the older lane to the north of the present highway is still intact, and still carries the bulk of the local traffic. To the east of this village, and about three miles off as the crow flies, high up on Mickleham Downs, there is a broad green tract, and this shows evidence of Roman work, and it is marked on the Ordnance map as Ermynt Street. In dealing with the roads we must bear in mind the state they were in the time of our forebears; in a great many instances they were only tracks, made by the foot traveller and the pack horse. The great central road on the chalk was from east to west, and the roads which came across the north-west and north-east corners of the county, from Hampshire and Kent respectively, were also used; and, as one writer puts it, the roads were in a 'villanously bad condition.' Malden mentions in his 'History of Surrey' 'that when the Roman roads were in

good repair, Surrey, south of the chalk, was more accessible than it was in the first half of the last century. In winter or in any wet weather they were literally impassable; in the deep sand-lanes, between high banks, divergence was impossible, and the rains scoured the warp into deep and shelving trenches impracticable for wheels.' "

Defoe mentions that as late as his time it sometimes took over a year to convey an oak from the Weald to Deptford. But however impassable the Weald may have been, there were substantial farmers in it, or men who made money by iron and farming combined. The old houses, manor-houses, and others, now farms, are built of magnificent oak timbers, and though wood was cheap it implied a flourishing middle-class population. It was in 1818 or 1819 that Mr. John Macadam introduced his system of road-making, the result being a fine hard surface, and when kept in proper order and repair they are a pleasure to walk on; but if you wish to take a country walk you must not take the high road, but find one of those abandoned roads, and then perhaps you will be clear of the hooting, bellowing, screaming, and shrieking motor, which in the summer smotheres you and everything else in dust, and in the winter mud.

On one occasion in the autumn of 1898 the clock in the church tower started striking nominally the hour of ten at night; but it did not stop when it had duly tolled out the requisite number, but went on and on, till at last the parish clerk went to the rescue by wedging a broomstick in its works. It struck over one hundred times.

They had a quaint custom here, by placing or hoisting a broom in the chimney of the house when the wife went away from home for a time, and left the husband to look after himself. The redemption was usually paid for in "beer" money, but this custom is rapidly dying out. I have been in the village and seen the broom displayed, and knew the man on whose chimney it had been hoisted, but I am unable to say what he had to pay before it was removed.

Some of the Surrey expressions are rather quaint. For instance, "How be you?" is the morning's greeting, to which "I be pretty middlin', thank ye," is the usual answer. The word "throw" is also used in a peculiar sense of being sold or disappointed in a bargain—"I got 'throwed' over that job."

A Surrey labourer's meals are his breakfast, his beer or eleven o'clock meal, his lunch the mid-day meal, his bait or four o'clock meal in hay and harvest time, and his supper—five meals in all.

But I cannot bring this paper to a conclusion without tendering my thanks to my two brothers and my friends who so kindly gave me information; and I am indebted to Mrs. Quartermain for her kindness in allowing me to use her late husband's notes on Bookham Church, and also to the Rev. J. Charles Cox, M.A., and E. H. Sharp, Esq., B.C.L., M.A., who so generously gave me permission to take any extracts I required from their respective works. My other authorities have been the Surrey Archaeological Records; also the following:—Black's "Guide"; "Field Paths and Green Lanes," 1844, L. J. Jennings; "The Surrey Tourist," 1884; "Memorials of Old Surrey," Rev. J. ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

I.—GENERAL CHARACTERISTICS.

It was only a little more than half a century ago that the ecclesiastical architecture of Italy began to be studied. Thomas Hope, in his "History of Architecture," while giving great attention to Italian buildings, dealt mainly with history, and but little with æsthetics. Of Professor Willis the same might be said, and though the illustrations in the books of both these authors were not so complete as might have been wished, their works remained for some time standard authorities, as people became familiarised with many of the most remarkable of the buildings to which they referred, by means of photographs, the value of which

can hardly be overestimated as far as regards the rendering of form without colour.

The works of Hope and Willis were followed by Ruskin's "Stones of Venice," which was the first attempt to claim all that it deserves for Italian architecture, but whose only fault, perhaps, is the rather depreciatory way in which our own Gothic buildings are spoken of in comparison with those in which he was more especially interested. It is true that Ruskin nominally confined himself to Venice, but his pages are full of instruction in regard to the architecture of the Mainland, whilst they opened up a mine of suggestive teaching, which, there can be no doubt, did much service to architecture and the arts ancillary to it, and which only required to be followed out in the same thoughtful way to effect good everywhere without any alloy. Pugin had drawn attention to our old English buildings in the historical spirit. Ruskin approached Gothic architecture from the æsthetic and philosophical side in his "Seven Lamps of Architecture," and the book to which allusion has just been made, with his extension of the fields of precedents south of the Alps, his placement of Pisan Romanesque, Florentine of Giotto's time, and Venetian by the side of English Decorated Gothic, as fit for adoption in this country, effected quite a revolution in our ecclesiastical architecture. His knowledge, study, mastery of language, and expression, and his skill in drawing, have left a deep mark upon the history of the English Gothic revival. Sixty years ago architectural design was little better than the compilation and recombination of the *dissecta membra* of mediæval buildings. Few remembered the noble brick architecture of Flanders, and but few that of Lombardy and Venetia, and in default of the costly and almost unattainable hewn stone from Caen or Portland, churches were built of the rudest Kentish rag, laid in random courses, and pointed, probably, with black mortar. It was in All Saints, Margaret Street, designed by Butterfield in 1849, that the first step forward was made in that bolder style of design which was to open so hopeful a future for English church architecture. Whether this church was influenced by the theories enunciated in "The Seven Lamps of Architecture" the writer will not undertake to say, but that it revealed a tendency to depart from ancient insular precedent in many important particulars is very certain. Then in 1855 and 1856 there appeared respectively from the pens of George Edmund Street and James Fergusson "Brick and Marble in the Middle Ages: Notes of a Tour in the North of Italy" and "The Illustrated Handbook of Architecture." Each was a publication of no ordinary importance and interest, for it filled up a void in our literature which previous volumes on the subject of architecture had never before precisely attempted; and, moreover, it filled it up with learning and ability.

As a useful and important contribution to architectural literature, Street's volume (of which a second edition appeared twenty years later) was heartily welcomed. It is true that the ground traversed by the distinguished architect was neither new nor unexplored, but proceeding, as it did, from the pen of an ecclesiologist, and not from that of a mere antiquary, Street's book placed the subject of Italian Gothic in an entirely new light; while, in his perfect mastery of the pencil, the author had an untold advantage over non-professional writers, and the very beautiful, numerous, and well-selected illustrations with which the volume was enriched did much to familiarise the untravelled with the chief beauties and characteristics of trans-Alpine church architecture.

It is hardly necessary to remind the reader that Street was an enthusiastic and uncompromising admirer of the Pointed styles, whether English, French, German, Italian, or Spanish, or that for years he was in the van of the revivalists. Like his distinguished compeer, Sir Gilbert Scott, he laboured with his pen as with his pencil to support the cause which he had at heart; and if the fashion of ecclesiastical architecture and art has undergone a vast change since his day, it was subject to a like mutability in the Middle Ages:—

"Credette Cimabue, nella pittura
Tener lo campo, ed ora ha Giotto il grido."

In the "Brick and Marble" of North Italy, Street boldly avowed his tastes, and by some of his critics was called to account for echoing Ruskin's denunciations of the Renaissance. It is fair to Street, however, to say that, in his preface, he expressed clearly and temperately what it was he went to Italy to study, and why he purposely neglected, in favour of the less-known Pointed remains, the more familiar

works of Alberti, Brunelleschi, Bramante, Palladio, and others of the Revived Classical school.

In his "Handbook of Architecture" Fergusson amply manifested that his knowledge of the Gothic was no less extensive than that of the other styles, and his two volumes, published in 1856, with their magnificent apparatus of 850 woodcuts, comprising plans, sections, elevations, perspectives, and details—nearly all of them engraved expressly for the book, and each with rigorous honesty telling on its face the authority from which it was derived—form a treatise singularly concise and singularly full of matter, fair in its statements, moderate in its polemics, always ingenious, often true in its theories; in a word, altogether a contribution of the first value to the architectural literature of England. Fergusson's pages on the various epochs of Italian church architecture are by no means the least fascinating portion of this most fascinating book.

An exceedingly useful and pleasantly written pioneer volume was "Sketches of Continental Ecclesiology, or Church Notes in Belgium, Germany, and Italy," by the Rev. Benjamin Webb, so well known as one of the founders, in 1839, of the Cambridge Camden (afterwards styled the Ecclesiological) Society, and from 1862 to 1885 Vicar of St. Andrew's, Wells Street, where, under the superintendence of his life-long friend George Edmund Street, he carried out many architectural and ritual improvements. Published in 1848, this work was not merely architectural; it was ecclesiological in its widest sense. Services, music, religious pictures, epitaphs, vestments—those of altars particularly—roods, altar-plate, metal-work of all kinds, and stained glass were discussed in it; and very interesting pictures of popular religion were liberally and pleasantly interspersed.

Undoubtedly the architectural value of Mr. Webb's "Continental Ecclesiology" arose from its detailed account of Italian Pointed architecture. A friend, a pet of the author's, he perhaps set too high a value upon it as a work of art, exclusive of association and antiquity. In perusing Mr. Webb's pages one would feel sure that this erudite ecclesiologist would have visited a sham west front to any cathedral in England with far other than the gentle blame he attached to it in Italy.

Since the publication of the volumes of which some account has been given, our literature on the church architecture of Italy has been copiously enriched with works from the pens of professional and lay-writers too numerous to specify. Suffice it to say that each in its own particular way throws new light upon the architecture of a country which fascinates the more ardently it is studied, view it from what standpoint we will; and if much of the Pointed Gothic work cannot be held up for our imitation, the most critical can hardly fail to bring away with them many a hint of value.

One of the most important cautions which the student of mediæval architecture should impose upon himself, on first visiting Italy, is to guard carefully against being too much carried away by the reaction against former prejudice. The lover of Pointed architecture frequently visits Italy late, and almost always under the impression that it contains little that is exactly in his line; and when, so far from this impression being confirmed, he finds that it is absolutely filled with objects of the deepest interest to him, he is apt to fly at once to the opposite extreme, and to be so much enamoured of these newly discovered beauties as to think them superior to those of the works on which his former ideas and knowledge had been founded.

This is a great mistake. Were it even true that the Pointed architecture of Italy were superior to our own, it would be unwise to in any degree substitute it for that which is pre-eminently our national form of architecture, and which has on that ground (as well as so many others) such special claims to be made the basis of future developments. Such, however, is far from being the case. Italian Pointed, though replete with beauty, is *per se* very inferior as an architectural style to the contemporary architecture of England and especially of France. Its details are so mixed with reminiscences of Classical antiquity, and its construction falls so far short of carrying out fully the great principles of Pointed architecture, that it must ever be considered as a far less perfect development of the style than those of Northern Europe.

These facts, however, once admitted, Italian Pointed may be studied with great advantage, and will be found to supply a vast fund of material which may be used to enrich and render more copious and complete that which we derive from our northern examples, and which may be imported into our own style without unduly infringing upon its nationality.

How tactfully this may be done was shown some sixty years ago, when the foreign Gothic mania was at its height, by Sir Gilbert Scott in one of the most beautiful churches raised in the vicinity of the Metropolis—St. Mary's, Stoke Newington—and perhaps in a more pronounced degree by Mr. Bodley in St. Michael's, Brighton, and St. Martin's, Scarborough; and by Messrs. Pearson and Street in St. Peter's, Vauxhall, and St. James the Less, Westminster. Unfortunately for our ecclesiastical architecture of the mid-Victorian epoch, there was no end to the oddities introduced by men not drilled by the study of ancient work. We had sad travesties of Butterfield and Street; architecture so French that a Frenchman would not know it, out-Heroding Herod himself; Byzantine and Italian in all forms but those used by the Byzantines and the Italians; mixtures of all or some of these; "original" varieties founded upon knowledge of old styles, or upon ignorance of them, as the case might be; violent strainings after a something very strange, and great successes in producing something very weak; attempts at beauty resulting in ugliness, and attempts at ugliness attended with unhoped for success. All these gave a wild absurdity to much of the architecture produced during the epoch alluded to, which it is impossible not to deplore; but at the same time it must be allowed that much of the best, the most nervous and the most original results of the English Gothic Revival were arrived at within the same period, as, for example, in that imposing group of churches built in the north-eastern district of the Metropolis from the designs of the late Mr. James Brooks—St. Michael's, Shoreditch, St. Saviour's, Hoxton, and St. Columba's and St. Chad's, Haggerston—districts which few amateurs or *dilettanti* would ever think of exploring in search of architectural beauty. In all these churches, like those of his contemporary, William Butterfield, the architect, by an utter absence of conventionality in the treatment of features which had become stereotyped, a studied simplicity of details which were elsewhere elaborated, and a tendency to abnormal outlines and unusual subdivision of parts, managed to attain originality without condescending to extravagance, and to secure for his works a quiet grace in which there may seem to some minds less of elegance than of dignity.

The difficulty of compressing such a subject as the characteristics of Central Italian church architecture within reasonable limits is so great that, except here and there, all references to the evidences of development from earlier buildings, of which most architecture affords examples, must be avoided; and, taking the reader to the buildings themselves, it will be the endeavour of the writer to convey a general idea of their character by a description of their more prominent features.

(To be continued.)

ILLUSTRATIONS.

HOUSE FOR G. J. BENNETT, ESQ., LINCOLN.

THIS house was built on the outskirts of Lincoln in 1909 by Messrs. W. Wright & Son. Thin local red bricks were used, with sandbrick arches and quoins, Ancaster freestone band and keystones and Ancaster weather-bed sills and copings. The house is covered with Elterwater green slates. The aspect is south.

HOUSE FOR CYRIL NELSON, ESQ., LINCOLN.

THIS house is built of thin local red bricks and covered with Elterwater green slates. The general aspect is south. It was erected in 1909 by Messrs. W. Wright & Son, of Lincoln.

HOUSE FOR G. E. SILLS, ESQ., LINCOLN.

THIS house is built of thin local red bricks and covered with Old Delabole slates. It has been built in a disused quarry, the land sloping gently away towards the south, in which direction the principal living-rooms look. A feature of the house is the hall, two views of which are shown, and the internal fittings of which are in selected red deal. The general arrangement lent itself to a forecourt on the eastern or entrance side, a feature that works in well with the scheme of this house. Messrs. M. Otter & Co., of Lincoln, were the builders.

HOUSE FOR HENRY G. GAMBLE, A.R.I.B.A., LINCOLN.

MR. GAMBLE'S own house was built in 1906 by Messrs. W. Wright & Son. The lower part is of thin local red bricks, the upper part pebble dashed, and the roof covered with

"Rosemary tiles." It also faces the sunshine. The internal fittings of the hall are in selected red deal.

ALTAR RAILS AND MONUMENT, LINCOLN CATHEDRAL.

THE altar rails and monument in Lincoln Cathedral have been made by Messrs. Bowman & Sons, of Stamford. They have been erected by the family to the memory of the Rev. Jacob Clements, formerly Sub-Dean of Lincoln, and to Mrs. Clements and their son, General Clements, and their

daughter. The altar rails are in Austrian oak fumed and wax polished, and the monument is in unpolished Hopton Wood stone.

All the works have been carried out to the designs and under the supervision of Messrs. Scorer & Gamble. The photographs of the altar rails and the monument are by Smith, of Lincoln, and all the others by Harrison, of Lincoln.

INTERIOR DECORATION.—II. FRANCE.—II.—THE EIGHTEENTH CENTURY AND AFTER.

By ALBERT E. BULLOCK, A.R.I.B.A.

(Continued from last week.)

THE principal decorators who flourished during the reign of Louis XVI. are Gilles Marie Oppenord, who decorated the Palais Royal, destroyed in 1786. He wrote a work on decoration, published by Huguier, and was contemporary with Christophe Huet; Jacques Verbrecht, who worked for forty years at Versailles, being assisted by Jules Antoine Rousseau in some of the later work, who was the father of Jean Siméon Rousseau (de la Rottière) and Pierre Rousseau. Verbrecht is recorded to have received 49,349 livres in the two years 1735-36 for the decorations to the *Chambre à Coucher de la Reine* for Marie Leccinska, one side of which still remains (see Nolhac and Pfnor). The plans of the apartment were one of the last works of de Cotte. An overdoor dated 1734 is the work of J. F. de Troy, who worked here with Natoire and F. Boucher. The modelled angles to the ceiling were executed in 1770 by Jules Antoine Rousseau. The other work of Verbrecht's at Versailles includes the decoration of the *Chambre de Louis XV.* in 1738, the *Chambre du Dauphin* in 1747, the *Cabinet d'Angle*, 1753-54, and the *Salon de la Pendule* in 1760, both of which latter show similar characteristics. Jacques Caffieri executed the bronzes in the *Chambre du Dauphin*. Verbrecht's decorations to the cabinet of Madame Adélaïde occupied him in 1753 and again in 1767. In the interim he had been at work in the *Salon de la Pendule* and the *Cabinet de Madame Victoire* from 1761-63. He is one of the few decorators whose change in style can best be followed. The evolution of the sculptured panel from the carved ornamented moulding until the freedom of the moulding from the carving was accomplished about 1787 is traceable, as it is also in the work of the Pineau. Verbrecht assisted Rousseau in the *Cabinet du Conseil*, but his share only extended to about 1,000 livres, while Rousseau was paid 21,000 livres for work which he executed from 1755-58. Richard Mique was a successor to Gabriel at Versailles, but practised a cheaper art than either of the last-mentioned of his predecessors in the work. He is said to have introduced coloured golds for decorative purposes, as was previously practised at Nancy by Jean Lamour.

Verbrecht and Rousseau very much influenced, if they did not actually have a hand in, the work of this period at Fontainebleau.

The work of Honoré Guibert, brother-in-law to Claude Vernet, exhibits a similar taste to the practice of Rousseau. He was the sculptor of the chimneypiece in the *Salle-à-manger* of Marie Antoinette at the Petit Trianon, where he worked in 1755.

Jean Honoré Fragonard's work is represented at Chantilly in the doors he executed for Mdlle. Guimard's boudoir. It would be difficult to find a more perfect artist than Fragonard unless it be Leriche or Dugourc, his contemporaries. The painters of this period endeavoured to portray nature with as much life as possible, and this is especially noticeable in the figures from the brush of Fragonard.

Jean Démosthène Dugourc, the brother-in-law of the architect Bellanger, is credited with the decorations at the Château de Bagatelle, Bois de Boulogne, a work which exhibits the highest expression of artistic taste, both in design and execution. The arabesque panels and cameos here are executed in the daintiest manner in bas-relievo work, with a jewelled inner string of ornament next the moulding. René Destailleur, in his "Documents de Décoration au XVIII. Siècle," illustrates several examples of the work of these last-mentioned artists and the delicately-painted panels of the little circular boudoir of the "Appartement à M. Wildenstein," attributed to Leriche. The work is, unfortunately, much faded by age and want of careful preservation, but it leaves little wanting in the contrast of refined taste in design and finish in the sculptured parts. The dado panels have the French motif of commerce, the caduces, in bold relief and the panels above are painted with birds and foliage.

The Rousseau family are responsible for the little bathing scenes painted in the *Bains-du-Roi* in 1770, and in the *Garde-robe* of Louis XVI., which was remodelled and redecorated in 1788-89. Their work in the *Salon de la Meridienne* was executed in 1774, the four Austrian eagles being modelled by the father at a later date for Marie Antoinette. The original decorations in the library when it was the bed-chamber of Madame Adélaïde were also by Rousseau.

The boudoir at Fontainebleau of Marie Antoinette was planned by Pierre Rousseau, who was assisted in the little painted cameos by Jean Simon Bartelemy (or Barthelemy). At South Kensington Museum is a fine example of a Louis XVI. boudoir, which was formerly in the Rue Vieille-du-Temple, No. 106, Paris, constructed for Madame de Serilly, lady of honour to Queen Marie Antoinette. The ceiling is a painting of Jean Jacques Lagrenée dit le Jeune, and represents in the centre medallion Jupiter and his eagle amid clouds, while in each spandril is a moulded and gilt eagle in a wreath. Each of the coved sides contains a classical figure within a circular medallion between two carved amorini, terminating in gilded scrolls, having also in the corner shells and wreaths. The decorated pilasters to the walls are painted with arabesques by Jean Siméon Rousseau (de la Rottière) within carved and gilt oak mouldings. The lunette contains the figure of Pomona painted by Lagrenée, and that over the door the figure of Vulcan.

The chimneypiece, with its muffled terminal figures, is in grey marble, and is the work of Claude Michel Clodion. This room is 16 feet high, 14 feet long, and 10 feet 6 inches wide. The decorations date about 1780, being evidently executed after the return of Lagrenée le Jeune and his brother from Russia. Lady Dilke states that the property originally belonged to Antoine-Jean François de Meyret d'Etigny, Seigneur de Serilly, born in 1746, and his wife and cousin, Anne-Marie-Louise de Pauge, born in 1763. They were implicated in the arrest of M^{me}. Elisabeth de France during the Revolution, whose names appear in a list of twenty-four people sentenced under Robespierre, and only M^{me}. de Serilly was saved of the number, by a ruse and the self-sacrifice of M^{me}. Elisabeth in May 1794, all the others being guillotined.

As a contrast to this example was published last week a view of a contemporary room executed in oak and carved with semi-relief panels from the library of the Montagnacs, 52 rue de Grenelle, Paris. The carving to the panels over the door, &c., contains trophies and implements used in the arts and sciences, intertwined with oak leaves. The room is about 24 ft. by 19 ft., and 11 ft. high. The chimneypiece is in grey marble, with refined carved statuary panels. I am indebted to Messrs. Litchfield, of Bruton Street, Mayfair, for the photo, which is of the actual example exhibited in their sale-rooms.

There exists an interesting room from the Hôtel de Noailles, at Mouchy, attributed to Gilles Paul Cauvet, in the collection of Mons. Guyot de Villeneuve. It is decorated with paintings, and the woodwork is carved and gilt. Dugourc, who has already been mentioned, followed closely the style of Cauvet and the younger Rousseau. He was also a designer of gardens, and is said to have made designs for many in England. His more elaborate designs were for theatre decoration. He was a great inventor, and very largely influenced the taste in decoration of the age. He expanded the scope of wall-paper manufacture, which was chiefly of the order of coloured stencil treatment. He is associated with Jaume in the designs for playing-cards, and was an extensive designer of prints, bronzes, and other decorative articles.

Bordeaux, next to Paris, contains perhaps more examples of Louis XVI. work than any other town in France, for which reason I have given an example from César Daly, of the Grand Salon of the Hôtel de la Préfecture. For other examples see the excellent photographic reproductions of Léon Deshairs' "Bordeaux: Architecture et Décoration au Dix-huitième Siècle."

Decoration towards the end of the century became somewhat stiff and formal, partaking of a Pompeian character, consequent upon the discoveries at Herculaneum about the middle of the century and the publication of treatises by Winckelmann and Le Roy upon the subject. This brought about a new style contemporary with the latter years of Louis XVI., the Revolution, and the Emperor Napoleon Buonaparte, known as the style "Empire." It was chiefly practised by two architects, Messrs. Percier and Fontaine, who decorated the Tuileries, destroyed during the Commune, and Napoleon's wing of the Louvre in this style, which is best illustrated by the photos from examples published in their book showing Napoleon's library, designed originally for the Chief Consul at Malmaison; the interior of the cabinet for the King of Spain, at Aranjuez, the medallions here being by Girodet, and the views by Bidault and Thibault; the chimneypiece in Napoleon's salon at the Tuileries Palace and the Salle de la Venus, Louvre Museum.

The style was practised in a modified form by the Brothers Adam in England, who had met J. J. Winckelmann and C. L. Clérissieu at Spalato. It has merits, inasmuch as it

exhibits refined forms and detail, but the pagan figures introduced are a questionable advantage. There are many other examples of the style at Compiègne and elsewhere, and it was adopted by most of the decorators of the epoch, who abandoned their more subtle art in order to be in the prevailing fashion. To the mind of the writer, however, the work of Rousseau, Fragonard, Leriche, Cauvet, and Dugourc is infinitely preferable.

In order to facilitate research by those interested in the subject of interior decoration, I have appended lists of the chief artists concerned in the reigns mentioned, together with the dates of birth and death, as far as can be ascertained, from Phillip's Biographical Dictionary, Bryan's Dictionary, and other works mentioned in the text and list of references.

I have to express my indebtedness to Mr. Rudolf Dircks, the Librarian of the Royal Institute of British Architects, for the loan of Italian photos from the Arthur Cates collection.

THE ROYAL SOCIETY OF MINIATURE PAINTERS.

THE branch of Art of which Richard Cosway was such a famous exponent has undergone strange vicissitudes in the course of a half-century. The introduction of photography seemed to give the death-stroke to miniature painting; the new toy (for a toy it was at the time) was patronised to the practical extinction of interest in the delicate colour-work so intimately connected with portraiture. Now that photography has been so developed that everyone is, or can be, a

EDWARD SPICER, Esq.

By Miss E. GERTRUDE THOMSON, R.M.S.

photographer, there is a desire for another toy, and hence the Renaissance of miniature painting.

At the gallery in Pall Mall East the seventeenth annual Exhibition is now opened to the public; and in walking about the room it is pleasant to observe in the technique the general freedom from the quondam high enamel finish, a freer brushwork having been fostered since the revival of the Art. The President, Mr. A. Williams, shows six portraits, of which the best is "His Eminence Cardinal Gibbons," where the reds are cleverly managed, even if we cannot say that they are kept under. Amongst Miss Hepburn-Edmunds' exhibits, the "Study of a Child" is very prettily painted in neutrals. Mr. C. W. Quinell shows four works, of which "The Magnet" fails to convey to us wherein the magnetism lies, and where we find the cold half-tones on the face very trying; in "The Black Veil" the width of the mouth is grossly exaggerated, the lips out of drawing, and their colouring crude, but otherwise the general effect is clever. Of Miss Inez Buchanan's work "Mrs. M. and her Little Daughter" deserves the highest praise; it is fully pictorial in regard to composition, colour, dress, and background, the latter being almost the ivory itself. Miss Rose Dakin's plaster medallion of H.H. Princess Indira of Baroda shows good technique. Miss Alice James deserves high commendation for the portrait of Tristram James, a very pretty full-length; the dull-green curtain background, the dark maroon carpet, and the white-gowned little figure with yellow hair all combine for a pleasant result. Miss Marion Broadhead's work in general is good. Mr. Nicholson's two works are pictorial in the Reynolds style, though this does not apply to his flesh tints. Mr. Hal Hurst has five exhibits; "Solitude" is a study in the nude, with the light and shades very curiously arranged, the light being on the back, with the arms and legs in shade; "The Brown Muff" is not satisfactory as a whole, but the girl's face is piquant, whilst the hat forcing its way out of the picture gives a strange appearance. "A Portrait" by Mrs. Bach is good in the

modern style of miniature work, and the delicate green scarf over the hat is prettily touched in. Of Miss Janet Robertson's works notice can be taken of but one, which is a good portrait of Mrs. James Watt in a crochet shawl and lace cap. Miss Power's "A Queen of Yesterday" is one of the best works in the Exhibition, and is well able to dispense with any kind of finish whatsoever; its bold style is highly effective.

Mr. H. C. Lintott's "His Eminence Cardinal Bourne" contrasts unfavourably with Mr. Williams' "Cardinal Gibbons," previously noticed, so far as the control of the reds is concerned; in his "Young Girl with Grey Scarf" Mr. Lintott has a clever study, which is one of the few paying heed to chiaroscuro, but there is an excess of "graining."

In the old style, "A Puritan," by Miss Nowlan, is very pretty, and makes us think that Longfellow's "Priscilla" has come to life. Miss M. B. Lee's "Portrait Study" in the old style is also commendable. Miss E. G. Thomson shows in "Mrs. McClellan, Senior," one of the best of all the exhibits; it is excellent work, and her portrait of "Edward Spicer" is also first-rate. Mrs. Macdonald's portrait of her husband is good work, bold without being obtrusive. In "The Chef" Mrs. Chamberlin has one of the outstanding works of merit, a thoroughly clever and masterly piece of technique and colour. Miss Lila Sampson's "Sister Catherine" is good, and Miss Dorothy Smart's portrait of her mother looks as if it is a really characteristic likeness. Altogether, this is an Exhibition to be visited.

W. ALISTER MACDONALD, Esq.

By Mrs. W. A. MACDONALD, R.M.S.

MR. H. PHELAN GIBB AND HIS WORK.

Yes! it is perhaps true that Art is long and Life is short; true, also, that Art consists in concealing Art. And yet with it all, though we admit that the Art is carefully concealed by Mr. H. Phelan Gibb, we deny the artistic result. And, on the other hand, if this present Show is indeed Art, we should suppose that if the Art were only shorter Life might be longer.

We would not have Mr. Gibb or anyone else think that this preface is written for the sake of a neat introduction, for it represents accurately the vox populi, if we may judge by the comments heard by us respecting Futurist methods.

Frankly, we regard such an exhibition as an insult to a long-suffering public. We had a companion with us when we went to inspect Mr. Gibb's work (need we say that the companion was a lady?), and she remarked that possibly Mr.

Gibb was posing as a kindly satirist on modern tendencies. Well, charity is the cloak for many sins, but it cannot cover those now on exhibition at the galleries of Messrs. Carfax & Co. Mr. Conrad's Aujourdhuisse studies are trying enough, Heaven knows, but Mr. Gibb's Futurist daubs act at once upon our risible and angry-passionate propensities. Our fair companion further suggested kindly, that if the eyes were half closed the effect was improved; we agreed, and went even further in suggesting that if the eyes were altogether closed the effect was still further improved.

What are the qualities shown in this collection of twenty-seven daubs? A negation of composition, of correct drawing, of decent figure-study, of harmonious colouring; but that is all negative. What are the positive qualities apparent? Bright and crude colouring, as if a child had laid hands upon the contents of a box of paints and daubed them on with all a child's crude ideas. The one quality at all laudable that may be observed is the desire to produce flow of line in a decorative spirit. But Walter Crane has shown us how to do this, and yet at the same time to preserve the decencies of figure and form and the graces of art. "Three Nudes: Study," is evidently one of these spirit-searchings for the flow of line, but a better title would be "The Three Dis-graces." Another sketch, called "Decoration (three nudes)," tears our heart-strings in very pity for the poor women who have been too evidently in the torture-chamber, so disjointed and twisted are they in all their limbs. In No. 18 (so-called "Still Life," which it is not, however), the only reputable piece of work is the liquor in the bottle and that is really well done. No. 11, "Trees, Sketch," is the least objectionable in the whole exhibition—not that this says much for it. No. 1, "Decoration," shows an Egyptianesque lantern-jawed misdrawn object, who would not need to emulate the widow Wadman's manoeuvring to draw Uncle Toby close to her by asking if he saw "anything in her eye"; the green in this object's eye is only too pronounced. But we have no patience for further analysis of this exhibition; truly is it an exhibition in the worst sense of the word.

MINOR DIFFICULTIES IN ARCHITECTURAL PHOTOGRAPHY.*

SOME of the minor difficulties in architectural photography appear so trifling and unimportant after they have occurred that the matter seems scarcely worthy of attention. But when in actual practice we are confronted with these difficulties—when they stand between us and success—there is no question as to their importance. There are few things more trying than, having found an exceptionally tempting subject, to be confronted by some little difficulty for which no preparation has been made. The golden rule is, of course, always to be prepared for anything that may have to be done, and for any eventuality that may occur.

In the first place, I should like to call attention to one or two small points in connection with the apparatus. A difficulty frequently encountered is the slipping of the tripod on a smooth floor. In order to prevent this I employ a small piece of apparatus which is not obtainable commercially, but which can readily be made by anyone with the slightest mechanical skill. It consists of three pieces of wood about 30 inches long by 1½ broad and ¼ thick with a screw, preferably a tripod screw, joining them together at one end. When opened out they form a most effective support for the tripod. Three or four small holes are cut a few inches apart near the free end of each piece, and into one of these holes in each a point of the tripod is inserted. It is the most satisfactory method of supporting the camera on smooth surfaces. Pieces of cork or indiarubber tubing on the ends of the tripod legs have been suggested, and are certainly useful, but there is nothing quite so satisfactory as this when the three strips of wood are extended, the tripod points inserted, and the screw in the centre tightened. In addition, it forms such a trifling addition to the apparatus to be carried that its weight and inconvenience are not worth consideration.

Another simple point is the form of the detachable lens panel. It is a great advantage in architectural work to have the lens panel pierced for the lens above the centre. This gives to the lens a certain amount of rise apart from the rising front. The smaller the diameter of the lens the greater the distance from the centre at which it may be placed. But it is principally in the small lenses that this is

found to be useful, as a larger rise is obtained for the lens without so much twist or strain on the bellows. I have a large range of rising front—2¼ inches—and with the piercing for the lens 1 inch above the centre of the panel I obtain a total rise of 3¼ inches. An additional power like that is sometimes of great value, although it involves no extra trouble. If the lens panels are already pierced in the centre, it is a simple matter to have a new panel made. The arrangement also has the advantage that when the panel is turned in the reverse position the lens is some distance below the centre, and this is useful in certain work.

A third small point is a piece of apparatus that was much better known to photographers of a past generation than to those of the present day—namely, a sky-shade. The sky-shade is as useful in interior work as for shielding the lens from the glare of the sky in the case of work out of doors. It consisted, in the case of the camera shown, of three pieces of wood hinged together, the middle portion resting on the top of the camera, forming the top of the shade, and the two other pieces hanging down and forming the sides. The size is so arranged that when placed in the normal position it can be used with the widest angle lens without cutting off any portion of the subject. The projection is just sufficient to allow the full illumination of the plate when the plate is in the horizontal position. It will allow more illumination than is required when the plate is in the vertical position, and sometimes fails in its object through allowing light to reach the lens from a larger angle than is included in the picture, and so prevent the shielding from being sufficiently effective. When taking a vertical subject, therefore, it is well to move the shade to one side or the other, so that the lens can be shielded on the side that requires shading. It can be adjusted until the troublesome light in front of the lens is sufficiently shielded without obscuring the view.

In considering the general question of architectural difficulties, it may be said at once that windows are the greatest trouble that the photographer can encounter; and whatever precautions he may take in the way of backing plates, or even of using plates that are specially suited for dealing with strong contrasts, a difficulty that is artistic rather than mechanical remains. The mechanical difficulty of the window may be dealt with comparatively easily. A plate that is effectively backed will resist halation under ordinary circumstances. But there is still the overwhelming difficulty that one part of the subject is abnormally bright relative to the remainder.

Before dealing with this, however, there is one point in connection with windows, a difficulty of a different type that ought to be mentioned. Sometimes an interior is comparatively harshly lighted. An instance lately occurred in my own work in the case of a comparatively small room filled with machinery, lighted by one small window. The machinery was, fortunately, all on the opposite side to the window. One part of the room was brilliantly lighted, the other parts were relatively very dark, so that the lighting from the photographic point of view was exceedingly unsatisfactory. When the sun was shining, naturally, matters were worse. A strong patch of light then appeared on the floor, and this made the contrast between the bright and the dark parts of the room still greater. The difficulty was overcome by covering the window with white tissue paper, and waiting until the sun was shining directly on it. The tissue paper acted as diffuser of the light, and a soft even lighting was obtained which allowed the details to be shown clearly and without harshness.

In domestic interiors, I have frequently secured a similar result by pulling down white blinds while exposing, and thus obtain a very much more even illumination in the room. All methods of that kind naturally require consideration and adaptation to special circumstances. Sometimes there may be several windows in a room, and a more effective lighting may be provided by pulling down some of the blinds and leaving the others up, or perhaps by darkening some of the windows altogether, and so introducing dark portions in which the darkness is softened by the general diffusion. But this method of diffusing the light by utilising sunlight on a white blind or tissue paper is a factor to be considered in photographic interiors. In interiors the light strikes downwards, and the lower part of the room is better illuminated than the upper part—namely, the ceiling—which almost invariably is too dark. The scattering of the light by such means of diffusion is like a grey day, and gives a much more effective result photographically than the harsh sunshine.

The greatest difficulty of all arises when there are windows in front of the camera. The difficulty arises, not so much

* A Paper read at the last meeting of the Royal Photographic Society, held at 35 Russell Square, W.C., by Mr. H. W. Bennett. A longer report of the Paper appears in *The Photographic Journal* for June.

MODERN EUROPEAN ARCHITECTURE.
GERMANY.[From *Moderne Bauformen*.]

RATHAUS AT KIEL. PRINCIPAL ENTRANCE.—Herr HERMANN BILLING, Architect.

mechanically, as in the strong difference between the light of the windows and the dark portions of the room. In interior work, whether windows are included or not, sufficient exposure has to be given to secure full detail in the dark shadows with a normal development for the subject. With such a subject a window, especially if the sky is seen through it, is enormously over-exposed, and everything near the window will be much too light relatively to the other portions. The subject will range itself into two groups of tones, one relatively exceedingly light near the window and the other, away from the window, relatively very dark.

The difficulty of windows is two-fold. One is the spread of the light in the subject itself, the other the diffusion of the light from the surface of the lens. The latter causes practically the same effect as if the camera in photographing a landscape were pointed towards the sun when the sun was actually shining. A scattering of light results which gives the impression that the photograph was taken in a fog. Not only does this difficulty arise from photographing an

interior when the camera is pointed towards the window, but, in addition, because it is the shadow side of all the objects in the room that is being photographed.

Sometimes, particularly in domestic interiors, small windows are found, very effectively arranged, and adding considerably to the beauty and attractiveness of the room, but unless due precautions are taken in dealing with them they will add to the photographer's troubles.

When there are several windows in a room and only one is included in the picture, the task is much easier than when all have to be included. My favourite plan, whenever practicable, is to cover the windows for a large portion of the exposure. When there are other windows in the room giving light by which to expose, this becomes an easy matter. For this purpose I equip myself with several hundred square feet of some black material, and although this adds considerably to the weight and bulk of what has to be carried, to the enthusiastic photographer it is a small matter if success depends upon it.

Whenever practicable I prefer, naturally, to cover the window from the outside. But some windows are almost inaccessible, and carefully arranging the covering inside becomes necessary. The windows are covered for the greater part of the exposure, then the lens is capped for a few moments, the coverings taken down, and a short supplementary exposure is made. The examples shown bear no indication of the covering.

When the windows that have to be included are the only windows in the room, the difficulty of the task is considerably increased. In that case it is practically necessary to arrange not to include the whole of the window; if the whole window is covered there is practically no light remaining with which to take the photograph. But when there is only one window is a room and that window or a portion of it has to be included, then, of course, the portions of the window that it is proposed to include will first be covered, leaving the other parts uncovered. It will be necessary to exercise great care in adjusting the shields in the front of the camera in such a manner that only the light from the portion of the window that is going to be covered is allowed to reach the lens. The lens must be carefully shielded from those portions of the window that are left uncovered during the whole of the exposure.

At times one of the difficulties in interior photography is to have sufficient range for the camera and to leave space enough behind it properly to carry out the focusing. When practicable, the camera may be placed in a doorway, partially outside the room, and an additional four or five feet secured, and it is then possible for the doorway to form a very efficient lens shield. Naturally, the photographer will make use of any material that he finds to his hand.

It is always desirable to arrange, if possible, that the light shall appear to come from the windows included, if it would come from those windows in the natural course. The windows must be given the appearance of naturalness. That is to say, they must appear to light the room as well as to serve in the lighting of the photograph. Work under conditions which necessitate the covering of the windows during a great part of the exposure is exceedingly slow, and exposure is prolonged, for if the quantity of light entering the room be reduced perhaps by 75 per cent., it is necessary to expose liberally if a harsh lighting effect is not to follow.

The supplementary exposure which is made with the coverings down cannot, I think, be considered in proportion to the total exposure. Rather, it is an independent factor. Some guidance as to the length of this exposure may be given. When a comparatively open garden or similar subject is seen through the window, the exposure, when the coverings are taken down from the window, may be taken as one second at $f/16$, with plates 200 H. and D., under the best possible lighting. The exposure may vary from that up to five seconds, the longer exposure being given if the landscape seen through the window is enclosed or relatively dark.

A frequent difficulty is getting sufficiently far away from the material that has to be photographed. An open door, as in the case of a room, may give four or five feet extra, but, sometimes, the camera has to be placed in a corner, with insufficient space behind it to allow for focusing or for arranging the picture satisfactorily. And at times, in a small interior, this necessity for space for working prevents sufficient of the subject from being reproduced in the photograph.

The method that I have adopted for overcoming this difficulty is to place the camera first in such a position as to give sufficient space for focusing. When all is arranged it is moved back so that a larger view is obtained in the place of a smaller one. Here, some means other than looking on the focusing screen must be taken to ascertain how much subject is included on the plate.

If there should be a window behind the camera all that is necessary to do is to open the lens to its full aperture, walk away diagonally from the camera to the farther side of the room, and then look through the lens to the back of the camera. In this way a point will be found at which the light from the focusing screen ends, and instead of a little circle of light being visible, there will only be, say, darkness. The parts of the room at which this change from light to darkness is seen form the limits of the view included on the plate.

If there is no window behind the camera a different plan has to be adopted. The glasses may be removed from the lens and the mount put back into the flange. Then two pieces of stamp edging placed on the frame of the focusing screen may be seen through the lens mount in the back of the camera,

and these pieces of stamp edging may be seen from the parts of the room that are just beyond the limits of the view, as just described. By this method it may readily be determined how much view is included on the plate. The camera can be moved right back into a corner, much closer to the wall than if it were necessary to go behind it in order to arrange the subject.

A method of working well known in the past, but not so much appreciated by modern photographers, is focusing by means of the swing-back. Sometimes a subject has the foreground very close to the camera, and the other parts are at a very great distance. In working with a whole plate camera and using a lens of 11-inch focus the difference between the camera extension for even 10 feet and 200 feet respectively is very great, and no amount of stopping down will under ordinary conditions give sufficient depth of definition.

In the case of a subject in which the foreground is really on the ground and the distance comes on the upper part of the plate, the camera may be tilted downwards, the swing-back set in a vertical position offering a ready means of adjustment for the depth of focus required.

The height of the camera should generally be the normal height of vision, but the length of focus of the lens must have a considerable influence in determining the height of the camera. Under normal conditions, if on one camera there were three lenses of 6, 10, and 20 inches focus, and the camera were placed at the same height from the ground, the nearest foreground would produce a very different effect, according to the lens used. With a very long focus lens the ground appears too much foreshortened; with a wide-angle lens it appears to be running uphill. With a wide-angle lens, I prefer, if possible, to bring the camera down to 3 feet or less from the ground in order to avoid that effect. In domestic interiors the camera should be just sufficiently above the level of a table to show the top of it, so as not to give the impression of looking along it as though it were an edge.

Mr. Bennett at the end of the meeting made some supplementary remarks as to his method of estimating interior exposures:—

Exposure was a subject presenting difficulty, though not any serious difficulty if the factors were considered systematically. He calculated on the basis of $f/16$, using plates 200 H. and D., and in the best possible light of the year. Any alteration in these factors meant that the exposure must be correspondingly modified. Under these conditions the exposure for domestic interiors—rooms in modern houses—would vary, in the majority of cases, from one minute up to four minutes. This was not a very long range. A room with light walls and furniture would be fully exposed in about one minute. A room with dark walls and furniture would take two, three, or four minutes, or in extreme cases five minutes, but in his experience no room in a modern house would take longer than five minutes. When the rooms had no furniture a very great difference was noticed. In that case the exposure might be as short as twenty-five seconds.

In churches or cathedrals that were well lighted the exposure might be approximately one minute for a general view of the nave and if badly lighted it might be three, or in extreme cases four minutes. The aisles of most cathedrals had distinctly inferior lighting. If they were lighted with plain glass windows, those windows being fairly unobstructed, the exposure again might be one minute. If the windows were obstructed by trees or other buildings the exposure might be anything up to two and a-half or three minutes. Stained glass windows necessitated from two to four times the exposure that would be necessary for white glass, simply by reason of the colour of the light transmitted by the glass. The choir of a cathedral generally required a much longer exposure than the nave, owing to the small quantity of light reaching the dark oak choir stalls. Exposures here might be from four to twenty minutes. In Lichfield four or five minutes would suffice; in Ely it had to be twenty minutes. After all, this was not a very long range. Crypts taxed the ingenuity in the matter of exposure. While some might be fully exposed in ten minutes, there were others where two hours would not be too much. These suggestions for exposure were calculated for the best possible daylight, so that for any time of the day or the year when the light fell short of its best modifications in the exposure would have to be made. The exposures in that case must be multiplied by the degree of falling off in the light from its best quality. If the light had only half its normal value the exposure should be doubled. In this manner the amateur might obtain a sufficiently accurate negative for every plate he exposed.

NEW RATHAUS AT KIEL.—Herr HERMANN BILLING, Architect.

[From *Moderne Bauformen*.]

THE LONDON SALON OF THE ALLIED ARTISTS' ASSOCIATION.

As we wandered around the arena and gallery of the "Royal Albert Hall for the encouragement of Arts and Sciences" our thoughts insensibly reverted to that delightful mid-Victorian story by Charles Dickens, "The Christmas Carol," wherein Ebenezer Scrooge, in the course of a brief nightmare had presented to him the vision of the Past, the Present, and the Future; in the vision he was attracted to the Past, was ashamed of the Present, and aghast at the Future. *Mutatis mutandis*, that is our attitude respecting Art in its varying phases to-day.

We have had occasion of late to inveigh against modern practice and modern tendencies; and here in this Salon collection of eleven hundred odd exhibits (very odd, some of them!) our feelings become intensified unpleasantly.

The Association does well to display on a poster the effigy of an inartistic Pegasus; for truly the flights indulged in by many of the—er—artists, carry them to heights

undreamt of and undesired by the men and women of pencil and brush of past years, past decades, past centuries.

We should not have patience to enter at length into the case against modern Art; but let this be said: that if the "Royal Albert Hall for the encouragement of Arts and Sciences" is degraded by such a display, the explanation is easily forthcoming why such work is not made Taboo. According to the Foreword attached to the catalogue, the Association was formed "to enable artists to submit their work freely to the judgment of the public, without the intervention of any middleman . . . exactly the same treatment is accorded to all members, irrespective of their position or reputation" (or want of reputation, let us hasten to add). Again, "Each subscriber has the right to show three works, without submitting them to any Selecting Jury . . . the keynote is inclusion not exclusion." That is quite explanatory, and incidentally it relieves the democratically selected Hanging Committee from all responsibility and from any justifiable clamour on the part of an outraged public, that the Hanging should be hanged.

Naturally, there is some good work on show, and our endeavour will be to give equal prominence to good and bad; indeed, the former will be really and preferably favoured; for whereas the proportion of it unnoticed will be slight, there will be a far larger percentage of bad work that will escape attention. And, en passant, we may add that we are confining our attention to the pen, pencil, and brushwork.

We may commence the review by referring to such works of the Hanging and Artists' Committees as we desire to make mention of; and taking these in alphabetical order we will commence with Mr. J. B. Manson, remarking that we have seen both better and worse, on the whole, but as regards his "Still Life" (a flower in a bowl on a woolly patchwork cloth) it is, of course, his own, but "a poor thing" at that. Miss Anne Marks' exhibits are worthy of a better position, but as this is a matter of chance by "drawing," there is nothing further to add on that score. "In the Wake of the Past" presents to our view a dear little boy in scout's uniform, saluting the armour of a long-dead ancestor; the whole conception is pleasant and the technique is good. "On Strike" shows two of Miss Marks' characteristic kittens pathetically begging for alms, and "Tired" portrays two other of Miss Marks' feline pets in a comatose condition; we recall that a black and white study of the last decorated the walls of the Royal Academy a while ago. Unfortunately, the propinquity of highly-coloured exhibits is detrimental to the colour scheme of the group just reviewed. Mr. C. H. Martin's "Columbine" is very clever indeed, and is effectively thrown up against a blank background. Mr. Frank Morris's landscapes ("Dunkery, Sunset," "The Orchard Brook," and "The First of October") are charming in their greens and russets. Miss C. M. Nichols' black-and-white sketch of St. Peter's Hospital, Bristol, is well worthy of inspection.

In Mr. Eric Forbes Robertson's "The Birth of Love" we have to notice the first of the very many displeasing works of to-day and of the day-to-be. If we regard Mr. Robertson as an *Aujourd'hui* it is perhaps just a trifle less uncomplimentary than if we dubbed him a Futurist. Miss Schebsman's portrait of Mr. Landon Ronald is not commendable; the flesh is corpse-like, and the blue background is displeasing nor to be condoned, even if it be meant to flatter Mr. Hubert von Herkomer by its imitation of his methods.

We were pleased with Mr. Hans Schwaben's contributions; he can paint atmosphere, sunlight and moonlight with an equal command of brush, and his boats in "Toilers of the Deep" and "The Fishing Fleet" are really good. So far for the members of the Hanging Committee. When we regard the work of the Artists' Committee it is less satisfactory. We will refer to seven out of the nine members of which it is composed; six of these are exponents of the Art of either to-day or to-morrow, such as Messrs. Robert Bevan, Harold Gilman, and Stephen Gore. Mr. Malcolm Drummond's contributions are crude of the crude. Mr. Charles Ginner's work can only be described as awful; "The Victoria Embankment Gardens" is a veritable Chinese puzzle. One of Mr. Mervyn Lawrence's pieces is called "Study for a Decoration." Ciel! what decoration! and the ultramarine plastered on! But for a welcome change, Mr. W. J. Lineham provides us with "Noontide," which is good and deserves to find a purchaser.

And now let us regard the works of other members of the Association. And in order to get it over, we will first of all dispose of the representatives of the schools of What Is and What May Be. There is Mr. A. Wolmark with his "Fisherman," that might be the work of a Futurist elementary student, and again in "A Decorative Still Life" we are confronted by superlative crudity; for this seems to be the keynote of the school in *pau lo post futuri*—crudity and nudity. Mr. Ernest Collings' "View of the Sea" is even worse than the piece just mentioned, if that be possible; it is altogether as if a child were taking its first essay in plastering on colour. And Florence Small (Mrs. D. Hardy) in "Dolly: a portrait" and "A Bowl of Fruit" pronounces herself as To-day (with a big T); so also Miss W. Walker, as evidenced by "Washing at River's Edge"; and as for her "Still Life" one wishes it were dead and buried. Miss Ethel Wright has departed from her old methods, so as to be in fashion; and though we recognise the craving for flow of line, the result is most displeasing in "Peonies" and "Rhythm." Mr. J. H. Hay supplies a variety, by blistering on the colour in "Moonlit Seapiece." M. Fernand Piret's "Coronation of King

George V." is cruelly bright and primordial. Mr. G. Ommanney's "The Dancer" is crudity personified in the colouring of the girl and the *mise-en-scène*. In the Black and White section, we regard it as an insult for Mr. H. Brodzky to show his "Drawing," which is in fact out of drawing, and with the head half-eaten away. And Mrs. Cora Gordon's "Frame of Drawings" looks like the work of Ablett's earliest preparatory class.

It is with a feeling of unbounded relief that we turn to some works which admit of commendation and more. Miss Ida Lees in "Moonlight" presents an effective study, and Miss Maude Harris's "Bank Holiday" shows pretty colouring, and this, too, may be said for Mr. Underwood's "Sunshine and Rain." Mr. Claude Walker's "Munster-on-Sea" is similarly commendable. Mr. Carr Armstrong's series of nine oil-colour sketches is well worthy of inspection. Mr. C. R. Morrison's landscapes are good and realistic. Mr. G. Pritchard, too, deserves favourable notice for his out-of-door studies.

In Mr. Sydney Herbert's "Water Colour" we are in the presence of a work than which nothing in the show is better. Mr. Cooke's "The Smithy" is reminiscent of Stanhope Forbes, and is quite good of its kind. Mr. C. Butler's nature studies are very good, and Mr. James Towers's "Tol Pedn Penwith, Cornwall," is fine indeed. The late Mrs. Thomas's studies compose well and are prettily tinted. Mr. de Brie's "The Scout" shows a vigorously painted cavalier. Mr. R. Walters's "A Summer's Day on the Wye" is quite a relief, after the eye-strain engendered by much already seen; and Mr. Tennyson Cole's portrait of Mrs. John Dennis is evidently a good likeness, with good technique in support.

Mr. Lawrence Hardy's Black and White study of "Horses Resting" is good, but there is too much barrel to the horse. Mr. T. E. Harrison's "The Mermaid" is very delicate penwork, and Mr. Harold Oakley's "Wireless" is one of the few first-rate exhibits, with excellent light and shade. And with a notice of Mr. J. E. Vinnicombe's studies, which show good distribution of the black and white, let us close our note-book and hasten into the outer air, where the fresh green of the trees in Kensington Gardens may do something to restore our peace of mind.

MR. KAY NIELSEN'S BLACK AND WHITE DRAWINGS AT THE DOWDESWELL GALLERIES.

In the ranks of artists, as elsewhere, we must expect to find mediocrity, as well as outstanding merit and conspicuous failure. We regard Mr. Nielsen, as here represented, as belonging to the first-named class, with a decided leaning towards good mediocrity. What he has done others may do, and some others could do much better. The drawings in general, including the ten in illustration of "The Book of Death," are certainly imaginative; indeed, imagination is Mr. Nielsen's strong point, and one that should hereafter stand him in good stead. In the latter series, "Solitude" is the best; the look of despair on the lover's face after his loved one has become the bride of Death is very good. Again, in "Vision" we see the lover sitting up in bed watching the levitation trick as performed upon his lost love, and a big—too big—moon forms a part of the picture.

Speaking generally, Mr. Nielsen's figures are so very uninteresting and so very attenuated. In "Spleen" we see little Billikins in a despairing mood, but, still, the composition is good. We cannot approve of depicting Scheharazade as kneeling quite nude before the Sultan whilst relating the thousand and one tales; from the text we gather that she was in bed whilst relating the stories, staying her discourse each morning when the time for rising supervened; but after saying this we may add that the sketch is decorative.

Two of the best drawings on exhibition are those of "The Flying Trunk," one of them being a particularly pretty colour-sketch. Also the two drawings of "The Story of a Mother" are excellent, especially where she is shown seated in despair before the flower, which droops as Death passes by with his scythe.

"The Breath of a Great City" is one of the most imaginative of all the sketches, showing the condensation of the city's human-exhaled breath into a visualised half-dead, wholly weary face. "The Prodigal Son" is clever, with an expressive physiognomy. Mr. Nielsen understands composition and likewise the distribution of black and white; but with it all we are not impressed by his work.

FORTHCOMING EVENTS.

Friday, July 26.

Architectural Association Camera, Sketch and Debate Club : Foreign tour in Brittany (sixteen days).

Saturday, July 27.

Northern Architectural Association : Students' Sketching Club.
Royal Sanitary Institute : Opening of Exhibition at the Exhibition Buildings, York.
Sanitary Inspectors' Association : Northern Centre Meeting at South Shields.

Monday, July 29.

Royal Sanitary Institute : Annual Congress opens at York (six days).

Monday, August 12.

Architectural Association : Annual Excursion commences at Shrewsbury (six days).

ARCHITECTURAL ASSOCIATION ANNUAL EXHIBITION.

It was a happy thought on the part of the Architectural Association's Council to vary the practice of showing the work executed during the session in their school by holding an exhibition of drawings and photographs of the performances of former students illustrating the results of their training. There is always a suspicion of unreality and artificiality in the production of school work. One never knows quite how much credit is due to the master and how much to the scholar. But when a student has left his college and produces good work on his own initiative and responsibility we can estimate what he is and what he has been made by the training he has undergone. We can in fact estimate more truly the value of the Architectural Association as a school for architects by work done by its students after they have left than by that done during their sojourn within its class-rooms and studios.

We naturally in an exhibition of this sort look to see if there is any general character about the work which may be taken as indicative of the atmosphere of the training school under review, and if so, what that atmosphere is and what kind of influence it exercises on the young architects who have been reared within it. The exhibition at Tufton Street does to us indicate that there is a distinctive atmosphere at the Architectural Association which differs from those of Paris, Liverpool, Manchester, London University, or South Kensington. There is a general tone and feeling about all the work which proves that the school has an individuality. There is a flavour pervading and influencing the personality of all those who have been students which, if maintained in after life, will always tempt the discriminating observer to mark each of these architects as "an A.A. man," just as there is an unmistakable cachet amongst "Ecole des Beaux Arts men."

We find then that A.A. men after they leave the schools still remain ardent students of old work and devote themselves to careful and thorough measurement as well as to sketching. For example, Mr. Arthur E. Maxwell's silver medal drawings of Compton Wynyates which were so much admired at the Royal Institute annual show in January last are here again to be seen and would reflect credit upon any institution that trained so excellent a student. Mr. H. Hubert Fraser, Pugin student, is another student of whom the A.A. may be justly proud and exhibits excellent measured drawings from Southwark Cathedral, the Church of St. John the Baptist, Kewston, Hunts; the Bishop's Palace, Buckden, Hunts; Southwold Church porch, and other places. Mr. F. T. W. Grant is another example of the earnest and

painstaking student, as is proved by his measured drawings of Edington Church, Wilts. These instances are sufficient, even if they were not supported as they are by others, to show that the Architectural Association education produces students of old work who are zealous and thorough, who have learnt how to measure and love to do it. Nor need it be thought that from the examples we have mentioned there is a disposition to restrict study to mediæval work, for Mr. T. A. Lodge, with his measured drawings of Queen Mary's Block, Greenwich Hospital, and others show that there is as much care bestowed upon Renaissance architecture. It will be noticed, too, that the A.A. students have been taught to discriminate. There are no specimens of labour wasted upon unworthy subjects simply because they are old. The buildings studied are worth studying.

Draughtsmanship has always been a strong point of the Architectural Association schools, and if there has sometimes seemed to be in the efforts of those still under instruction some tendency to slap-dash methods, one can forgive this when it matures into the brilliant effective draughtsmanship of Mr. Philip G. Hepworth, Mr. Cyril A. Farey, Mr. Clough Williams Ellis, Mr. W. J. Palmer Jones, and others now supporting their alma mater in the present show. It is to be noted that the A.A. men in attaining the brilliancy have escaped the laboured mechanism of the French draughtsmanship of the Ecole des Beaux Arts. There is a freshness and verve about the A.A. man's drawing that is absent from the Parisian. The latter always makes us think what a lot of time and care must have been spent on the drawing, the former that the draughtsman thoroughly enjoyed the handling of his medium, whether it were black ink, crayon, colour or pencil. Speaking of pencil, what charming pieces of work are Mr. F. R. Barry's sketches from Italy.

But after all the measurement of old work and the making of effective or charming drawings are not architecture. A school may produce earnest students and brilliant draughtsmen, but if it does not make architects it is not an architectural school. How does the Architectural Association prove its capacity in this respect? What sort of buildings do its students design and erect when they get the chance? First of all, we have examples of competition drawings whether for students' prizes, such as Mr. R. Mountford Pigott's Soane medallion design for a Shakespeare memorial theatre and Mr. A. Douglas Robinson's for the city entrance in 1911, or for open competitions which for most young architects are their only opportunity for showing what they can do in Architecture with a capital A. Mr. Robinson's series of perspective studies shows the effect of good training in right

FROM SKETCH SUBMITTED BY MR. F. H. SWINDELLS FOR PUGIN STUDENTSHIP, 1912.

methods of design, and though neither he nor his fellow-student won the prize, the A.A. need not be ashamed of their efforts.

In open competitions we have Mr. Lodge's and Mr. Farey's essays for Marylebone, the latter's design for Regent Street; Mr. F. Gordon Troup's and Mr. J. Reginald Truelove's efforts for the Port of London Authority's offices. As the latter was one of the six in the final test and the other designs mentioned were at least commendable we think the A.A. is herein justified.

Then we have specimens of buildings erected from the designs of former A.A. students, illustrated both by photographs and working drawings. Naturally as the architects concerned are mostly young practitioners, the buildings are usually small, although Mr. Oliver Hill has had a good-sized job at Moor Close, Binfield, Berks. Mr. W. J. Palmer Jones has had an interesting one in a Desert House at El Assassif, Luxor, Upper Egypt, and has made good use of his opportunity, but we may fairly say without exception that the executed designs of former students of the Architectural Association show a loving care and an ability that speak well for the future and evidence a capability to maintain the peculiar position of modern British domestic architecture.

On the whole we consider the Association has good cause to be proud of its students and the students to be grateful for the early training they have received.

In opening the Exhibition, the President, Mr. Gerald C. Horsley, announced that a Third Year's Day School Course was being instituted, and that the R.I.B.A. Board of Architectural Education had consented to accept this extra Third Year Day School Course as equivalent to the present Third and Fourth Years' Course in the Evening

School, and would grant certificates to satisfactory students who had completed their three years in the Day School, exempting them from the R.I.B.A. Intermediate examination. He also announced that the Royal Academy authorities had consented to admit students who had completed the Association's three years' course to the Royal Academy Schools without requiring them to pass the usual entrance examination in subjects other than design.

NOTES AND COMMENTS.

We have received the programme of an interesting literary competition which is the result of a legacy to the city of Barcelona by Don Francisco Martorell, of Pena. From this legacy a prize is offered of 20,000 pesetas (£666) for the best original work on Spanish archæology. The work may be printed or in manuscript and must be sent in before noon on October 23, 1916. It must be written in Latin, Spanish, Catalan, French, Italian, or Portuguese. The competition is being conducted by the Mayor and Corporation of Barcelona, who will on the sending in day appoint a jury of five judges to select the best work, and the prize will be awarded on April 23, 1917, the festival of St. George, patron saint of Catalonia. The author of the successful work must publish it in the Spanish language within two years of the award of the prize; failing this the Corporation of Barcelona may publish, and in that case will own the copyright.

We learn from the *Manchester Guardian* that the old Globe Room in the Reindeer Inn at Banbury is to remain in England. The dealers who purchased the room and had it cut out of the inn and brought to Old Burlington

OLD HOUSES.

LINCOLN

Aug. 1908
F. H. Swindells

Street are stated to have an offer from America for this relic, but they are now willing to accept an offer made by a well-known public man here who desires to begin collecting with the Globe Room as his initial treasure. It would be very curious, says the *Manchester Guardian*, and we quite agree, to know the inner history of such transactions as those of the Tattershall chimney-pieces, the old Globe Room, and many another fine piece of old English architecture that has been torn from its setting and brought to London with a mysterious chorus of "Purchased by an American millionaire" and "Old England going piecemeal across the Atlantic," and so on. Apparently in these sorts of transactions the American millionaire never really purchases the article until it is quite settled that no Englishman or English society is able to do so.

The decision of the Senate of the University of London in favour of the Foundling Hospital site for the proposed new University buildings may be regarded as the adoption of a compromise. In centrality of situation it is not quite so good as the Bloomsbury site, but it approaches this latter and on that ground is better than the South Thames bank, but it is far inferior to the latter in prominence before the public eye, and not even equal in this respect to the Bloomsbury location.

At the 64th annual meeting of the Somerset Archaeological and Natural History Society Professor Boyd Dawkins, the President, in his address gave some excellent advice on the use of museums if they are to be a means of education and not merely repositories of curiosities, so far as the general public is concerned. Referring to the need of the use of museums in general education, he said that in this country general education was suffering very much from its being confined merely to book knowledge. That was all very well, but it was possible to have too much of book knowledge, and as a rule the book-worm was a most unpractical person who was no use at all in the world outside books, and the general drift of things was from the acquiring of knowledge by books alone towards the study of the things themselves. The things themselves were the things which were taught, he might say, in the museums, and it was impossible to study history, it was very difficult to study even the material out of which history was built, without examining the things themselves. Courses of lectures should be given, and the schools and teachers should be encouraged to come and see what they could learn from the things in the museum. That was an important direction in which the services of that Society could be enlisted in favour of the higher education of the country. Throughout the country there was a gradual drift towards

that happy situation. He had spent something like thirty years of his life in organising a museum in Manchester, and that museum was a most important adjunct not only in the education of the University, but in the education of the masses, and they could do that if they liked at Taunton. It merely required a little thought; it merely required the popularising and the bringing of these things within the reach of plain people; it merely required the stripping off of those long technical names which were as related to science as thorns were to a bramble, and replacing them by the plainest names they could get; and when they once excited the curiosity of the children they would be on a long way in the direction of growing as original thinking men and women.

In the course of the proceedings of the Joint Committee of the Lords and Commons considering the Bills now before Parliament relating to the care of ancient monuments Sir Rowand Anderson gave some valuable evidence. He said it was impossible almost to devise a scheme or system in dealing with our ancient monuments that would be free from criticism and many legal and other difficulties, but he thought some approach might be made to such a thing. Nothing would facilitate legislation on this subject more than the education of the people to know and appreciate the value of what they possessed. The means to this was (first) an inventory of everything that was deemed worthy of preservation; (second) a survey by means of drawings and photography of all their ancient buildings and historical objects. The first of these was in progress. As to the second, there was now in Edinburgh a collection of drawings of their ancient buildings and their accessories, the like of which was not to be found anywhere else in this country, and this collection was constantly increasing. It was not confined to ruins, but included old churches, castles, bridges, old town halls, historical buildings in occupation, with their fittings and furniture, all carefully surveyed and measured. There must be something like 1,400 sheets of drawings and photographs, and these had been produced without any expense to the public. The making of this survey was a part of the curriculum of the training of an architect, and its influence was now becoming apparent in the work of the younger generation of architects. It had been the means of rescuing from oblivion and loss many interesting things. No better illustration could be given than Holyrood Palace. If possible, the collection of these drawings should be reproduced and sold at a price that would cover the cost. Unfortunately, there was no money available for this purpose, and the collection was consequently much curtailed in its usefulness. Antiquarian and other kindred societies, heritors, and others dealing with parish churches, landowners with interesting remains on their estates, and those occupying houses of more or less historical interest would benefit greatly by having this publication to refer to. In any new arrangements of the Ancient Monuments Commission he hoped the publication of these records would be taken into account and favourably considered.

Sir Rowand Anderson also, in reply to a question, touched on a matter subsequently discussed at a congress of archaeological societies held in London last Monday. Sir Rowand suggested that no old parish church should be restored without the sanction of the Advisory Board. The congress came to a similar conclusion and added a resolution expressing the desirability of having an inventory kept of all movable church property.

THE ARCHITECTURAL ASSOCIATION.

THE following is the list of awards and prizes in the Day School of Architecture for the session 1911-12:—

First Year.—Book prize for first place in History Test paper and general excellence in this subject, M. T. Waterhouse; book prize for first place in Construction Test paper, and general excellence in this subject, A. S. Turner; A.A. Sketch Book for first place in Freehand Drawing, A. S. Turner; the Studio Prize for the best portfolio of drawings

made during session, A. S. Turner and M. T. Waterhouse equal; hon. mention and authors of drawings selected for school portfolio, M. H. C. Doll, C. J. Brooks, W. A. Forbes, H. F. Gossling, and J. Burford.

Second Year.—Travelling Studentship, £15, for studio and lecture work during session 1911-12 and general progress, H. J. H. Dicksee; specially commended and special prize given by headmaster, H. G. Satchell; hon. mention for general progress during session, R. S. Wallace, E. C. Davies, J. S. Hodges, and W. W. Locke.

End of Session Test.—Subject, "A Study for a Market Hall." Award and prize given by Mr. Gerald C. Horsley, President A.A.: First, E. C. Davies; second, R. S. Wallace; third, H. J. H. Dicksee. Drawing selected for presentation to school portfolio: H. J. H. Dicksee, E. C. Davies, H. G. Satchell, R. S. Wallace, and W. W. Locke. Students recommended for the Association two years' course certificate: E. C. Davies, H. J. H. Dicksee, J. S. Hodges, H. G. Satchell, H. G. Tebbutt, R. S. Wallace, and W. W. Locke.

EVENING SCHOOL.

First Year.—Book prize, value £2 2s., H. A. N. Medd; second prize, value 10s. 6d., F. W. Mackenzie; hon. mention, H. S. Davis.

Second Year.—Scholarship, free pass to third year, value £15 15s., J. B. M. Walch; book prize, value £2 2s., E. K. Smith; hon. mention, A. J. Thompson.

Third Year.—First prize, scholarship, £15 15s., divided between D. J. Gordon and T. W. Dowsett; hon. mention, H. F. Prynn and H. D. Archer.

Fourth Year.—Travelling studentship, value £15, A. T. Hardman; book prize, value £2 2s., T. F. Ford; hon. mention, T. F. H. White, F. P. Spooner, and D. W. Stuart.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students who are qualifying for the Final examination have been approved:—

Subject III. (a.)—Mr. R. A. Barber, Mr. E. F. Bothwell, Mr. H. C. Bradshaw, Mr. R. S. Dixon, Mr. H. A. Dod, Mr. E. Gee, and Mr. T. C. Lawrence.

Subject III. (b.)—Mr. H. Lidbetter, Mr. E. Prestwich, Mr. W. H. Thompson, Mr. R. A. Walter, and Mr. W. E. Woodin.

Subject I. (b.)—Mr. K. Glóver.

Subject II. (a.)—Mr. K. Glover.

Subject III.—Mr. K. Glover, Mr. G. C. Charlewood, and Mr. C. J. K. Clark.

ROYAL ARCHÆOLOGICAL INSTITUTE.

THE Summer Meeting of the Royal Archæological Institute opened at Northampton on Tuesday, July 23. The town itself can boast of no unworthy record, both in local and national history, ever since it was selected as one of the important centres of the Middle Ages, while it serves as a splendid centre.

The proceedings opened with a reception of the members in the Town Hall by the Mayor and Corporation. The building itself is a most commendable piece of modern Gothic. The first portion was commenced in 1861 from the designs of Mr. E. W. Godwin. Twenty years ago a considerable extension was carried out by Messrs. Jeffery & Holding, who were careful to maintain the completest harmony with the other portion.

The civic welcome by the Mayor was reinforced by that of Mr. S. G. Stopford Sackville, M.A., D.L., the President of the meeting, who spoke on behalf of the county. He alluded to the losses by death which have occurred in local archæological circles since the Institute paid their last visit here thirty-five years ago. But they still had in Northamptonshire men who cultivate archæology and art, like Mr. J. A. Gotch, the Rev. R. M. Serjeantson, and Mr. C. A. Markham. There existed a certain amount of feeling that the restorations carried out half a century ago were not what they ought to have been. One of the benefits of a visit from such a body as the Royal Archæological Institute was to remind people of the true principles of such work. He could not help wishing that the clergy had more time to study the arts of the past, as their position was one of singular responsibility. In the county there were no very fine remains of castles, but there were still many notable mediæval and Elizabethan houses, which were as fine as any in England. Their excellence and number were to some

extent due to the facilities of water-carriage which had always existed.

Sir Henry H. Howorth, K.C.I.E., D.C.L., F.R.S., F.S.A., the President of the Royal Archaeological Institute, acknowledged the welcome to the very typical English county of Northampton. Its country gentry, he said, were the most famous of all English squires, for they lived largely on their estates, and took their share in the administration of the county affairs. Furthermore, that part of the Midland counties was the fountain of literary English. Its rich soil and valuable resources made it wealthy from very early times; in fact, there was no other county which had been so continuously prosperous. Although there have been serious tragedies in it, as at Fotheringay, the memories of the county were, taken altogether, exceedingly happy and pleasant. The Archaeological Institute had come to see Northamptonshire's beauties. Their Society wished to be tested by their "Transactions," which remained on the extraordinarily high level of seventy years ago.

The first visit on the programme was to

ST. PETER'S CHURCH.

The Rev. R. M. Serjeantson, M.A., F.S.A., in describing the church, said that the structure as we now see it appears to have been built during the third quarter of the twelfth century. It was not, however, the first ecclesiastical building to occupy the site, for during the restoration of 1851 fragments evidently belonging to a pre-Conquest church were found here. A thirteenth-century manuscript contains a rather pretty legend connected with this earlier church. According to it a certain Norwegian (who had spent a year and a half in it, serving God day and night in fasting and prayers) was told in a vision that if he dug in a certain spot he would find beneath the pavement the relics of a saint. The tomb was brought to light, but for a time it remained unopened, until one Easter eve, when a crippled girl who had been placed in the church to pray for a cure was completely healed, the church being suddenly lit up and the bells chimed a joyful peal. Near the body was some writing, which stated that St. Raginer, nephew of St. Edmund, and, like him, murdered by the Danes, was buried there. Edward the Confessor, who was king at the time, paid great reverence to the place, and caused a great shrine of gold and silver to be made from the offerings at the tomb, and in it the relics of the saint were placed. This is the last heard of the shrine; but there continued till the fifteenth century to be a Guild of St. Raginer in this church. The twelfth-century church now standing is conspicuous as to the interior by the slenderness and gracefulness of the pillars and by the broad bands which surround many of them—a very unusual feature at this date—and by the claw ornaments or griffes at the bases connecting them with the square plinths below. The capitals are all different. The fact that in every case the arch as well as the capital is carved adds much to the beauty and effectiveness of the work. Early in the fourteenth century the aisles walls appear to have been rebuilt on the original site and of the old materials. The tower collapsed in the reign of James I., demolishing the western bay of the nave arcade. When rebuilt a good many years later, it was erected one bay eastward of its original site. The east end was also shortened in the same way, though again restored to its original length in 1851. None of the old fittings remain except the font, which dates from the fourteenth century. In the thirteenth century special rights of compurgation were attached to this church. Anyone in the town or neighbourhood who wished to clear himself of any crime by compurgation was compelled to spend a solitary vigil in St. Peter's, and next morning to take a solemn oath that he was innocent, and also bring a certain number of others to swear that they believed in his innocence. Other churches tried to claim the same privilege, but Bishop Grosstête decided that the right was attached to St. Peter's only. The patronage of St. Peter's belonged originally to the Cluniac Priory of St. Andrew in this town, until it was recovered by the King in 1266. It remained in the Royal hands till 1329, when it was granted to the hospital of St. Katherine, near the Tower of London, who have presented ever since. During the latter part of the sixteenth century the church was a meeting place for the more advanced Puritans. At the west end are three monuments of some interest—(1) a tablet to the memory of John Smith, one of the earliest mezzotint engravers, who was buried here in 1743; (2) a white marble bust to Wm. Smith, the father of British geology, who discovered the fact that the world was built in strata; (3) to the memory of George Baker and his sister Elizabeth, who died respectively in 1851 and 1861. It was

Miss Baker who with her own hands removed the white-wash and plaster from the capitals of the church, and who saved the whole building from being pulled down to make room for a new brick church.

Mr. W. H. St. John Hope, M.A., remarked that the removal of the limewash by Miss Baker was a very meritorious work from one point of view. But it should be observed that the carved stonework had been deteriorating ever since, owing to the decomposing action of the gas. The two alternative remedies were the removal of the gas or the covering of the surface again with clean whitewash. The early builders did not like a gloomy interior, so they introduced whitewash. The fact that some of the pillars were composite led him to believe that the church was intended to be spanned by a barrel vault, and for this purpose they prepared the capitals for the side arches to carry the abutment across the aisles. Against this theory an objection might be raised from the thinness of the walls. They had, however, to remember that Norman masonry varied in quality enormously. The Normans built in concrete, and if their mortar happened to be good the walls would stand an enormous strain. But sometimes the mortar was rotten, in which case a collapse easily occurred.

After an interval for lunch the party reassembled at

ST. SEPULCHRE'S CHURCH.

Here the guide was again the Rev. Mr. Serjeantson, who is vicar of the parish. The church of the Holy Sepulchre at Northampton was, he said, built originally about the year 1100, and was meant to be a reproduction of the church of the Holy Sepulchre in Jerusalem. The latter church was built in the first instance by the Emperor Constantine, and consecrated in A.D. 335. It consisted of (1) the circular building, which covered the actual sepulchre—this was an oratory rather than a church, and contained no altar at first, though in later times three altars were placed in it; (2) to the east of the sepulchre was a large quadrangle "open to the pure air of Heaven," and surrounded by cloisters on three sides; (3) still further east was the great church known as the Martyrium, built upon the spot where the three crosses were alleged to have been found by the Empress Helena. The altar was at the west end of the church, and that faced the Holy Sepulchre. Constantine's church was burnt in 614. It was soon, however, rebuilt, but was again destroyed in 1010 by order of the Caliph Hakem, who ordered the whole church to be razed to the ground. Permission was quickly given for its rebuilding, though the work was not completed till 1048. The new church of the Holy Sepulchre was somewhat different from the one built by Constantine. It consisted of the circular building over the sepulchre, to which was attached an eastern choir. Neither the cloisters nor the great church of the Martyrium beyond were rebuilt. We thus get the church which was the prototype of all our European round churches—a circular nave with a choir attached to it on the east. The Holy City was captured by the Crusaders on July 15, 1099, and it is probable that the Northampton Sepulchre church was begun almost immediately in 1100. It has generally been assigned to Simon of Senlis, the first Norman Earl of Northampton, who is known to have taken part in the first Crusade, and who was a great builder. It was probably intended as a thankoffering for the recovery of the Holy Sepulchre from the infidels, and for his own safe return. The building was quickly completed, for by a charter which cannot be later than 1116 Earl Simon handed it over to the Cluniac Priory of St. Andrew, which closely adjoined it. This charter at once disposes of the theory that the Northampton round church was founded by the Templars, who did not come into existence as an Order till 1128, and who did not arrive in England till 1134. From 1116 till the Dissolution of the Monasteries, St. Sepulchre always belonged to monks of St. Andrew's, and never had the slightest connection with the Knight Templars. The church consisted in Earl Simon's time of a circular nave and a small chancel, which terminated probably in an apse. Towards the close of the twelfth century the north wall of the chancel was pierced by arches, and a north chapel was added. It is interesting to know that this chapel was dedicated to St. Thomas of Canterbury. It will be remembered that Beckett's ever-memorable trial took place in Northampton in October 1164, and that he escaped from the town through the North Gate, which was within a stone's throw of St. Sepulchre's. He was murdered in 1170, and canonised in 1173. It must have been very shortly after this time that the new north chapel was built. The two arches which connected this chapel with the then chancel are of distinctly transitional character. During the latter part of the thirteenth century a second

north chapel was added; the south aisle was built and perhaps rebuilt early in the fourteenth century. Towards the close of this century the clerestory and triforium of the circular part of the church were pulled down. Much loftier Pointed arches were built upon twelfth-century piers, and a fine tower was added at the west, taking the place of the dome which had previously covered the "round." At the same date were built the three lofty arches giving access from the "round" into the nave and side aisles. The wooden corbels which support the present nave roof date from the fifteenth century, and represent musicians with various instruments. In 1634 the extreme north aisle was pulled down. In 1861 the present chancel, with north and south chapels, was added, and the second north aisle was rebuilt on the old foundations. In mediæval times, in addition to the High Altar, there were altars dedicated to St. Thomas of Canterbury and St. John the Baptist, to Our Lady, to St. Nicholas, and to St. Martin. The present fittings of the church are all modern. On the south side of the "round" is an interesting processional cross locker, and on the north side a twelfth-century tympanum is built into the wall. Close to this is a splendidly preserved brass to the memory of George Coles (and his two wives and twelve children), who died in 1640, and was a great benefactor to the town.

Mr. Hope then made some interesting observations. The

would be found to include a round church. These Templars' or Hospitallers' places were on a very small scale; the chapel certainly need not have been large, because the Templars were not themselves priests, and were not bound to attend any services.

A somewhat hurried inspection only was possible before a move was made under somewhat heavy rain to

ST. GILES'S CHURCH.

The church of St. Giles was, according to the Rev. R. M. Serjeantson, in the early twelfth century a small cruciform building, with central tower and without aisles. In the first half of the next century the chancel was widened by rebuilding the north wall 4 feet northwards of its old line, thus adding considerably to its width, but throwing the centre of the west window quite out of line with the middle of the chancel arch. The chancel was also lengthened. The builders next turned their attention to the nave. They began on the south side, and evidently intended to add a south aisle. One arch was built up in the hitherto unpierced south wall, but then there came a pause. The tower began to show signs of weakness. This was remedied by the simple expedient of blocking the wide round-headed tower arches on all four sides and piercing these with very much smaller arches. The fillings of the northern and southern arches have never been removed, but those on the east and west

ST. SEPULCHRE'S CHURCH, NORTHAMPTON, ORIGINAL PLAN.—From Cox and Serjeantson's "History of the Church of the Holy Sepulchre, Northampton."

building was, he said, a very remarkable structure because of the round part of it. Some little time ago he had gone to a good deal of trouble in investigating all that could be found out about round churches. They were best divided into four classes. First, there was the ordinary parish church, such as this one and the one at Cambridge—these had nothing to do with the Templars. Next came the chapels, of which the most noteworthy was the one in the Tower of London, with its round nave and square chancel ending in a polygonal apse; there had been another example in the Palace of Woodstock. Thirdly, there came the churches which were undoubtedly belonging either to the Order of the Templars or to the Knights of Jerusalem. The present Temple Church in London had a predecessor near Chancery Lane, and when the present block of offices were being erected on the site the workmen discovered the stumps of some of the pillars. Fourthly, there was the round church erected at Clerkenwell by the Hospitallers of St. John of Jerusalem, and which was as large as the recently-restored example in the Strand. It was customary to talk of these structures as a round nave, but he did not feel at all sure that it should not rather be regarded as the base of a belfry like the ordinary central tower. Although the plans were borrowed, the common-sense mediæval builders saw in it an opportunity for introducing an original feature. Such a belfry would make a very picturesque building of it. There were in this country quite a large number of sites where the Templars had Preceptories. He felt very little doubt that if proper investigation was made on these sites one after another

sides were opened in 1853. Subsequently aisles were built on the south and north sides, and north and south chancel chapels were also added. In 1614 the tower fell, and crushed a considerable portion of the nave. About the middle of last century the church was enlarged by the addition of two bays further west and an extra north aisle. From a documentary point of view, the most interesting point with regard to St. Giles is the fact that all through the Middle Ages it served as a meeting-place for the Mayor and Assembly of the town. The borough records contain frequent instances of regulations having been drawn up in the church. We find the same secular use of a church everywhere. Indeed, at Romney the vicar was obliged to bribe the Corporation not to hold their meetings in church while Divine service was being held. St. Giles contains an interesting fifteenth-century tomb of alabaster in the north aisle. It is known as the Gobion monument, although the last male Gobion of the Northampton branch died in 1301. Near by are two chained books.

The next move was to the Town Hall, where tea was taken by invitation of the Worshipful the Mayor in the Council Chamber. The five Corporation maces, dating from the time of James I., Charles II. (2), and George I. (2) respectively, were on view.

After tea, brakes and motor-cars were entered for a drive of about one and a half miles to

THE ELEANOR CROSS AT HARDINGSTONE.

This cross, standing on the outskirts of the park at Delapré Abbey, was, of course one of those erected by

Edward I. upon the route of the funeral procession in 1290 of Queen Eleanor from Lincoln to London. Above the octagonal base, which itself stands on eight steps, are four canopied niches, each of which contains the figure of a queen, facing the four cardinal points. The head of the cross has long disappeared, and at the time of the Battle of Northampton (1460) it was known as *crux sine capite*. The heraldic sculpture and the naturalistic treatment of foliage are noticeable points in its decoration.

Mr. St. John Hope briefly dealt with the historical side of the monument. Towards the end of 1290 King Edward and Queen Eleanor of Castile set out together for Scotland. On the way the queen died at Harby, in Nottinghamshire, on November 28. Edward was extremely attached to her after fifty years of happy married life, and he hastened back to London so that the queen might be buried with due solemnity. In accordance with custom the body was disembowelled, and the parts taken out were buried in Lincoln Cathedral, where a beautiful monument was set up. Her heart was put in a vessel and conveyed to London, where it was deposited in the church of the Black Friars. The conveyance of the body to London occupied a good many of the short November days, and entailed numerous stoppages. Tradition has it that wherever the body rested a cross was

IN PRAISE OF SLATES.

By CLOUGH WILLIAMS-ELLIS.

WITH so much talk amongst architects of the right use of materials—and the right materials for various uses—their comparative neglect of Nature's own roofing, slate, is curious.

We have vast stores, practically inexhaustible stores of it, all ready and awaiting our pleasure these hundred million years and more; ready to our hand for the mere hewing and cleaving of it, yet we waste our time and our money in all manner of "slate substitutes" and "patent roofing" that can seldom compete with natural slate *qua* economy, and never approach it *qua* quality.

I suppose the old, old lure, "something new in roofings," carries the same irresistible appeal to some constructors as do the latest fashions to all good women, no matter if novelty be the only conceivable recommendation.

With the perennial crop of fancy roofings their newness and their strangeness is, sad to say, their attraction in chief; they sprout hopefully, they sometimes flourish

ST. SEPULCHRE'S CHURCH, NORTHAMPTON, AFTER RESTORATION.—From Cox and Serjeantson's "History of the Church of the Holy Sepulchre, Northampton."

set up. We certainly know that a number were ordered and executed. In the Public Records Office there are a series of accounts of the queen's executors, covering the two years in which they were executed. The most important was put up in Charing Cross—though for what reason we do not know, as the journey from the last stage to Westminster was so short. It is a little difficult to arrive at its exact cost; it seems to have been nearly £800, which was a tremendous sum to be spent on a memorial in 1290. The next one mentioned is that erected at Lincoln at a total cost of £134. The cross put in in the middle of Cheape was probably destroyed as far back as the fourteenth century; beautiful fragments of it may be seen in the Guildhall Museum. The cross at Hardingstone is one of a group of crosses which were contracted for by a master mason named John of Battle, and which work out at an average cost of £95. The verge or shaft of this one was wrought by William of Ireland; the whole of the imagery and a good deal of the carving was done in London. As William of Barnac was paid to bring it to Hardingstone, it is not impossible that the material used may be Barnac stone. It was curious that the crosses about which no details are found in the records are those of which no remains exist. Apparently the crosses were commenced and then left unfinished, being finally cleared away.

In the evening a paper was read at the Grand Hotel by the Rev. R. M. Serjeantson on the history of Northampton. (To be continued.)

exceedingly for a little space; they are forced into precocious growth by a liberal top-dressing of guarantees, promises, testimonials, and unproven assertions—and the like cheap fertilizer—and lo! the promising little plant suddenly withers away; disillusioned householders waving sad farewells with their barren guarantees. And the epitaph of that fancy roofing—is it not written in the pages of the *London Gazette*?

Still, slate need not fear competition from this yapping pack of mongrel substitutes, when the best they dare even bark for themselves is, "We're not quite so cheap, but we're nearly as good."

And that's only their bark. Their bite—well, they are seldom allowed a second one.

Of tiles I will speak later; a good tile is a good tile all the world over. There is nothing better, save a good slate, and perhaps it's unfair to compare them as it is man's poor best in the roofing line pitted against Nature's—and Nature has been in the business a good deal the longer of the twain, say, by a million centuries.

Still, there are several causes that have probably contributed to the professional boycott of slate, the very qualities of the material proving a snare in incompetent hands.

What sort of vision does "slate roof" conjure up in the mind's eye?

Probably an excessively low-pitched roof of large thin purplish-blue slates, crude of colour, hard of line, mean of proportion, an altogether machine-made, exotic, unfriendly looking thing.

That's, unhappily, a true picture; that, 'tis true, 'tis pity, but greater pity still, it need never have been.

That it need never be so in the future is what I am striving to show.

Meanwhile, for the tile-at-any-price architect, the tragedy lies in the fact that, despite this depressing picture, the roof is as mechanically perfect a roof, as sound and as everlasting and as weather-tight a roof as any engineer in all Westminster could contrive for you.

And the architects, the real live ones, must bravely face the facts; face them on every side if there is ever to be a great and living architecture of the present and the future.

They must admit what the engineers know for the truth—that there is no roofing that is *quite* so good as a Portmadoc slate. (See Tables at end.)

They can like it or they can lump it; they can't deny it; they cannot shirk it.

The real architect will very soon find worthy work for slates to do, and the good slate, its worth so long unrecognised, would worthily respond to intelligent and sympathetic handling.

Roofs will be conceived on generous lines in terms of slate, slatily. A sane slate treatment will harden into a new and better roofing tradition, and we shall be spared tiles, tiles, tiles *ad nauseam*, good, bad, and indifferent, few of the first but plenty of the others—in season and out—as often out as in.

Elaborate physical tests and experiments have established beyond all question the mechanical perfection of certain Welsh slates (notably those from the Festiniog group of quarries known to the world as "Portmadocs"), while chemical analyses have placed their lasting powers above all possible doubt. However, the great test of time needed no chemists to establish that, there being hundreds of old roofs, not merely in existence, but in perfect condition, to give eloquent testimony to the longevity of such slates.

So the slate roof is a good roof; there cannot possibly be a better, as most will admit, adding mentally, "Nor an uglier."

And why that last? It is partly prejudice, partly ignorance, for there are slates and slates; but sad to say, is very largely the result of actual observation.

The fact is, the slate is such a willing, obliging creature that it has been meanly taken advantage of—and shamelessly exploited by the penny-wise.

Take the usual flat pitch of slate roofs aforesaid—it seems to be commonly regarded as an inevitable concomitant of slating, whereas it is simply the result of stinting, speculative builders having unluckily discovered that slate can safely be laid at an extraordinarily small slope and still be weathertight. I bet they know the exact angle to half a degree; also, that when used in large thin units, no lighter roof can be contrived, excepting with some pig-in-the-poke patent materials.

That's really one of the failings of slate—it will allow you to take all sorts of liberties with it that a tile would not stand for an instant.

Imagine even a 30° roof of plain tiles on 3½ in. by 2 in. rafters, with no boarding or felt between them and the bedroom ceilings.

Picture the state of affairs after the first sharp shower with a driving rain behind it.

A short shower isn't much of a test. The best of tiles, the best, not the least, will absorb a great weight of water before they are fully saturated; and while they are thus sucking up, not much rain will get through.

When they have drunk their fill, and if the added weight of water hasn't already broken down your light flat rafters, the bedroom ceilings will very soon make it clear that a tile is not a Portmadoc slate, and refuses to be treated as such.

One sometimes hears it said that slate roofs are hot in summer and cold in winter. Well they are, and they are not.

The truth is that again the obliging slate has had its good nature taken advantage of, it having been found that slates make a perfectly weathertight roof without the expensive and weighty underclothing of felt and boarding that the pampered tile demands; and it is scarcely fair to pit slates neat against tiles plus felt plus boarding, and then declare that slates have lost the match for non-conductivity.

In short, the long-suffering slate will submit to indignities that would literally break a tile, and this being once discovered, it has reaped the inevitable reward for its willingness, and become the drudge of all and sundry, the builders' maid-of-all-work.

And so it has come about that slate, the most perfect of roofing materials, natural or manufactured, is largely associated with architectural drudgery. We see the dull work, the dirty work it has been put to, and are thereby blinded to the fact that faithfulness in small things bespeaks fitness for great, and we seldom give it a chance of doing even decent, let alone noble work.

The unassailable position of Portmadoc slates as a roof to live under is, experience apart, amply demonstrated by hard facts and figures. The only quarrel that has ever been picked with the material is an æsthetic one. Let us not condemn the indicted slate without hearing its defence, neither forgetting that it is merely arraigned on a point of appearance, and on nothing else whatever.

If Nature has bountifully provided a material mechanically perfect for the roofing of the world's buildings, surely it is up against the world's house-designers, the architects, to devise their roofs in such manner that they are good to look on as well as to live under. In Heaven's name, what else is an architect for, but to turn the best procurable materials to the best possible account?

(To be continued.)

COMPETITION NEWS.

BIRMINGHAM.—The Baths Committee of the Corporation received the award of the assessor, Mr. A. N. Bromley, of Nottingham, in regard to the plans for the projected baths at King's Heath. His decision places Messrs. Crouch, Butler & Savage, of Newhall Street, Birmingham, first, and the premiums go to Messrs. S. N. Cooke & W. N. Twist, and Messrs. Round & Weaver.

REIGATE.—Forty-four plans in competition were received by the Town Council for the laying out of the Reigate Lodge estate. Mr. Raymond Unwin, the assessor, gave the premier award of £40 to Mr. Vincent Hooper, and the second of £10 to Mr. Dann, both local gentlemen.

SELECTED DESIGN FOR THE NEW HEAD OFFICES OF THE PORT OF LONDON AUTHORITY.

We have much pleasure in completely illustrating this week Mr. T. Edwin Cooper's masterly accepted design for the new head offices of the Port of London Authority.

THE Building Sub-committee of the Education Committee of the London County Council have had under consideration the question of expediting the architectural work in connection with the erection of new schools. They state that in view of the magnitude of the building programme for the next fifteen years they are of opinion that it is extremely desirable that the general progress of the work should be accelerated, and that, in order that this may be done, it will be necessary to engage additional draughtsmen in the architect's department. The services of ten or twelve additional draughtsmen, at a cost of £30 a week, will be required in connection with the proposed acceleration.

ECCLESIASTICAL ARCHITECTURE IN
CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy,"
"The Cathedrals of England and Wales," "London Churches,
Ancient and Modern," "The Cathedrals of Northern France," &c.

I.—GENERAL CHARACTERISTICS.

(Continued from last week.)

WE have two influences brought out very forcibly in the churches of Central Italy. These are local and personal. The Pisan and Genoese, for instance, are distinctly local styles, in which early traditions were preserved to some extent from first to last; and, on the other hand, it is impossible not to notice the very great personal influence exercised over their descendants, as well as over their contemporaries, by some of the greater Italian architects, of whom Nicola Pisano may be adduced as the most eminent example.

There is a third influence which must be taken into consideration—that of foreign architects. San Francesco at Assisi was evidently the work of a foreigner. The interior of Perugia Cathedral bears a very close resemblance to some of the great "hall" churches of Germany. Genoa Cathedral—the west front more particularly—owes something of its peculiar character to contact with French art; and the lofty two-bayed, unclerestried eastern portion of Sant Andrea at Orvieto is decidedly Teutonic.

In mediæval times the Italians, it may be supposed, led a life more like our own at the present day than any other people. The country was populous, the cities were numerous and rich, and the people full of emulation and individuality. In England and France one of the most striking facts is the almost complete absence of anything very obviously personal in the art of the Middle Ages. The history of our old architects would be that of a race of giants, so equally matched that it is difficult to assign the pre-eminence to any one over the rest. We have had no Nicola Pisano here; our old architects' work is singularly equal in character in each period, from Romanesque to Perpendicular; and whether it was displayed in the little village church lying concealed on the banks of a rippling stream, in the vast abbey of some sequestered valley, in the great town church, or in the cathedral, there seems to be matter for equal admiration in each.

In Italy, on the other hand, we see a number of individual architects exercising each their peculiar influence, varying very much in their skill and power, and having, moreover, the doubtful advantage of a constant recollection of the works of a different style of art from whose traditions they seem never to have emancipated themselves.

Placed, in short, very much in the position that we are at the present day, they never wrought with the same absolute and joyous freedom as their contemporaries in France and England did; and thus, though their architecture may be inferior, it is of very special value to us; for we may, perhaps, see better the cause of some of our shortcomings when we investigate theirs, and so be led to emulate the excellence of the works they executed under conditions so similar to those under which we were labouring rather more than half a century ago, even if we cannot quite rival the complete perfection of the greatest mediæval architects of the North.

The first thing that strikes the student of Italian church architecture—that is to say, if he is unacquainted with that of Southern France—is the low-pitch of the roofs, a fact which had a most important influence on much of the designing. One consequence is that the roof becomes an entirely unimportant feature externally, even if seen at all, for a very flat-pitched roof does not appear in perspective. Then again, low-pitched roofs mean low-pitched gables, and these necessitated horizontal treatment, everywhere noticeable, rather than a vertical one, and so assist in maintaining the Classical traditions of the country. To this dominant horizontality is due the fact that Italian architects, while evidently particular about the lateral continuity of their designs, seldom considered it necessary to provide any vertical connection between the parts, so that buildings frequently seem to have been erected in separate storeys or features, afterwards piled upon one another.

Another thing that attracts a northern eye is the absence of buttresses. An Italian never used a buttress if by any possibility he could avoid it. If it were necessary to resist the thrust of an arch, he thought that the natural and legitimate thing to do was to put in an iron tie-rod, and he did so in the most unblushing manner. Some critics

are of opinion that while the use of the buttress led to picturesqueness and piquancy, the adoption of the iron tie-rod lent itself to refinement and repose.

In the great majority of buildings—perhaps in all cases where Classical architecture was employed—the plan is found to be exactly that of the ancient basilica or hall of justice—i.e., a parallelogram or nearly a double square, with the semi-circular or octagonal recess at one end, usually called the apsis—in the court-house, the judge's seat; but in the church, the sacred place where the altar was erected, and round which sat the bishop and presbyters. In some examples the atrium or quadrangular forecourt was retained, as at San Clemente, Rome, and San Ambrogio, Milan, and which in appearance would appear to bear some analogy to the more modern cloisters. In some of the Rhenish Romanesque churches, notably Sta Maria in Capitolio at Cologne, the Abbey Church at Laach, and the Minster at Essen, the cloister adjoins the west front of the building, and we not infrequently find an atrium before the façade of a quite late Italian church, as, for example, the cathedral at Novara and Sta Euphemia at Piacenza. In some of the later edifices we find the transept arm broken out as in a Gothic cathedral, but by far the most usual is the simple Latin plan, though some examples of the Greek plan exist; these, however, must in all cases be attributed to Greek architects, for the Latins never altered the more ancient form to which they were accustomed. This simple plan, so much preferred by the early Christian Church, may be traced through the Romanesque to the Gothic, and there can be no doubt it was the excellent basis which lies at the root of all the variations which that style engrafted upon it. This form of plan was used by the early Christians, doubtless because in many cases they found it ready presented before them in the existing basilicas, which, with little alteration of arrangement, they converted into churches; and, secondly, because its simplicity was well adapted to their wants.

This simple plan was extended and added to subsequently, though always preserved as the main principle of arrangement, particularly in the neighbourhood of Rome; as, for example, in such Romanesque churches as San Lorenzo at Orvieto, San Giovanni Zoccoli at Viterbo, and in those two remarkable churches, San Pietro and Sta Maria Maggiore at Toscanella. These and the numerous Romanesque churches in Lucca and Pistoja consist merely of a nave, aisles, and short aisleless choir, terminating in the simple apse which was never forgotten. Sometimes, however, there is no bay intermediate between the nave and the apse, a peculiarity of great frequency in the Romanesque churches of Apulia. Other apses were added at the ends of the aisles, then, where there were any, to the transepts; and as the fashion of building chapels to tutelary Saints became more in vogue, they were even introduced laterally. The cathedrals of Verona and Orvieto, where a series of shallow semi-circular apses break out from the nave aisles, exemplify this treatment.

In all the earlier instances the floor was level, except only two or three steps to the apse or tribune, where the high altar was situated, and in not a few instances the episcopal throne; but as the prejudice against burial within the consecrated walls died away, and as the Church began to build for itself, we find the introduction of a new feature in the plan, and which is treated with the utmost importance—the crypt. In the edifices now under consideration the crypt appears, not as a place of sepulture, but as a sort of lower church, complete with its altars and shrines, and supposed by some to have been erected in imitation of catacombs—those early places of meeting in which the primitive Christians were wont to hide themselves, and to carry on their simple but sincere worship. It is, however, most probable that these crypts were prepared for the reception of the bodies of confessors and martyrs, and as such were treated with as much care and attention as the rest of the church—not sunk in the earth, but often nearly on a level with the floor of the nave, and with a number of steps ascending to the choir above (which had then been removed from its first position in the nave), just as we see it at Canterbury, Rochester, and Winchester. It is thus at San Miniato at Florence, Sta Maria della Piève at Arezzo, and San Flaviano near Montefiasco, where there is a complete lower as well as an upper church. San Gregorio at Spoleto has a very remarkable crypt, about the only feature of interest in that once interesting, but now sadly "modernised," Romanesque church. This custom of building crypts and subterranean chapels was continued in the architecture of our own country until the end of the twelfth century, when it gradually fell into disuse.

In examining the features of any national school of architecture, it is worthy of notice how distinctly some of its peculiarities and prejudices are marked from the very first, even in the ground plans of the buildings it produced. This is notably the case in the ecclesiastical edifices of France, England, Germany, and Spain. Each had its special arrangement of plan, seldom departed from, and handed down from age to age as a precious heirloom. And going to Italy we find that the same feature strikes us there in almost all the buildings of the Pointed style. Their plans are all derived from two ancient types, both of which are of remarkable antiquity. It was from the basilica, converted into a church, with its nave and aisles terminated at the end by an apsidal projection from a sort of transept, that almost all the Italian Gothic churches with transepts were copied. Indeed, if we look at the ground plan of the great basilica of San Paolo Fuori le Mura at Rome, and compare it with the fully developed Gothic church of Sta Croce at Florence, we shall see that absolutely the only difference is the addition of small chapels on the eastern side of either transept; so that, in place of the one apse which marks the former, we have the central apse and five square chapels on each side of it; while in the churches, founded on the same type, of the Frari at Venice, and San Domenico at Siena, there are three; and in Sta Maria Novella, Florence, Santi Giovanni e Paolo, Venice, and Sta Anastasia, Verona, two eastern chapels on either side of the apse, all opening directly into the transepts. The church of San Clemente at Rome, dating from the fifth century, with its three aisles terminating in parallel apses at the east end, is the other type followed in such churches as the cathedral of Torcello, and, indeed, in all Italian Pointed churches without transepts. And even when, as in the thirteenth and fourteenth centuries, the Italian architects endeavoured to secure an immensely wide unbroken area of nave, as in the great churches built by the Orders of Friars Preachers at Pisa, Perugia, Siena, Viterbo, and elsewhere, they still looked back to their old precedents and finished them at the east with a short choir, very frequently square ended, and several rectangular chapels on either side of it. So that, in this respect, Italian Gothic was simply a natural development from an earlier style, and adhering very closely to the older plan and arrangements, affords us scarcely an example of those prolonged choirs of which our English cathedrals and abbeys are perhaps the most magnificent examples. But it was not only in respect of the plan that it thus founded itself upon what had before existed. The traces of Classic influence are indeed so many and so clear, that it is hardly speaking too strongly to say that Gothic art was never fully developed in Italy, so shackled was it by the ever-present influence of buildings in another style. Hence the more we study its peculiarities the more we see how curious a mixture there is in it of the character of Classic and Gothic art. When we proceed to inquire into the ecclesiastical architecture of Italy, and the domestic, which is inseparably connected with it, we cannot fail to be struck with the strongly-marked *local peculiarities* which occur in every town or group of towns. While the general system of architecture is much the same as in other parts of the world, each *city* of the present day, which corresponds to a *state* in the Middle Ages, has some characteristics of its own, due either to the material ready to the builder's hand in the neighbourhood, the genius of a local architect, or the accidental introduction, by commerce with foreigners, of novelties which ultimately became popular. Thus, the Lombard churches are for the most part constructed of red brick, the clay for which was dug out of the great plain on which they stand. The Florentines covered theirs with an incrustation of green, yellow, and other coloured marble, which was quarried near their city. The Siennese, again, had recourse to red brick and ornaments of terra-cotta, which abounds in that part of Tuscany. At Florence, moreover, the whole architecture, since a certain period, bears the stamp of the genius of Arnolfo; at Siena, of Agostino and Agnolo, two architects who worked for the Republic, and constructed its chief public buildings. These differences often manifest themselves, not so much by some great or startling divergence from what is usual in point of plan, as in a peculiar fashion of mouldings or capital.

For ages our English architects had no eye for colour. This fault was generally admitted, and suddenly everyone strove to atone for it by the introduction of natural polychromy in all directions, most of which was supposed to be founded on Italian examples. Such hot haste was dangerous, for if there is one lesson taught more forcibly by the Italian Gothic churches than another, it is that where

colour is introduced it must be done thoughtfully, and with a full sense of the increased danger of failure in works which its use involves. It should be borne in mind that though bad architecture is sad work, bad architecture badly coloured—and what fearful examples does modern English Gothic present of this!—is more than doubly sad, and that there can be no greater error than to suppose that the introduction of colour allows less attention to be paid to form than, or even as little as, before.

The very first thing that strikes the eye on visiting Italian buildings of the Middle Ages is the extensive use of what has received the name of constructional polychromy. Its highest development is, of course, where marbles of different colours are used in the actual construction of the buildings, as in the cathedral and campanile of Florence, and the cathedrals of Genoa, Orvieto, and Siena. The mass of the work at Florence is of white or veined marble, but it is interstratified and panelled in certain portions with red and dark green marbles; in addition to which, the parts are enriched by inlaid patterns in marbles of exquisite colours, the whole forming the most delightful combination of hues which can well be imagined.

At Siena Cathedral the materials are white (or veined) and black marbles, which are for the most part alternated in equal proportions. Here the effect is hardly so satisfactory as what we see at Florence; the contrast is too crude, and the proportions of dark and light colour unpleasing. This was, however, corrected in the great addition commenced against the south transept, but never completed, where the colours have only one course of black to four of white, with a slight addition of inlaying; and here the effect is exceedingly fine and harmonious. In the east end also the proportion of white and black courses, and of inlaid pattern, is very pleasing. This is a fact worthy of mention, because, whenever this mode of decoration is attempted, it is of the utmost importance that the proportions of the different colours be most carefully weighed and studied.

In the Romanesque San Miniato at Florence it may be observed that the constant use of an inlay of coloured marbles, so prevalent in that city, arose naturally out of the usual tendency of the builders of whatever neighbourhood to make use of the materials ready to hand in its vicinity. Thus, the Istrian marble supplied Venice; Broccatello, of a red and orange colour, Verona; Verdi di Prato was extensively used by the Florentines; while other marbles are Luini (ancient Etruscan); Rosso di Levanté, Porto Venere (black and gold), Carrara, Pavonazetto, and Breccia, and Verde and Rosso, from Polcevera.

The environs of Florence were rich in marbles of different kinds, and hence the temptation, when prosperous times and days of high culture set in, to make use of such materials largely in order to produce a rich and sumptuous effect. It would perhaps be unreasonable to complain of an exaggerated use of a special material when it has resulted in the creation of almost a special class of architectural design peculiar to the Florentine district; otherwise it might be said that the Florentine architects would have produced a more monumental and more strictly architectural effect had they restricted their use of these marble inlays to the less constructively important parts of their buildings, marking the construction by plainer and more massive materials.

The façade of San Miniato is, of course, entirely altered from its original form by this addition of incrustations in a later day; the old basilica, in fact, underwent successive changes in the course of generations as one artist after another brought his contribution to it. Happily, this was when Florentine art was in the hey-day of its existence, and the solemn old Romanesque basilica could hardly but benefit by any additions made to it in such an age; but, for all that, it is questionable whether the variegated panelling of the façade is not rather discordant with the austere contours of the old building.

In Sta Croce—one of the several works by Arnolfo di Lapo which adorn the city of Florence, and in style a simple edition of that of the cathedral—the treatment of the modern façade is remarkably satisfactory and harmonious, but there is all the difference between a building designed from the first in this style and a building of older date and simpler style to which the polychromatic decoration has been added.

The use of marbles of different colours for detached shafts and pillarlets is a universal feature in Italian architecture, and is a system of decoration peculiarly open to ourselves from the great variety of rich material now at our disposal. The façade of Lucca Cathedral is a beautiful instance of this, but it is in two pillars at the west end of the nave of Genoa Cathedral that the skill of the Italian artist in

FROM SKETCHES SUBMITTED BY MR. F. H. SWINDELLS FOR PUGIN STUDENTSHIP, 1912.

constructional polychromy is perhaps more clearly and beautifully enunciated than elsewhere. These pillars, which support the arches of a constructional gallery running across the west end of the cathedral, are of a later date (c. 1300) than the church in general, and are so beautiful in their detail that, without any wish to disparage Italian architecture, the first involuntary impression of the writer was that they must have been designed by a French artist. Of whatever nationality he was, the designer of these columns made himself perfect master of the Italian material. The pillars consist of an octagonal nucleus of plain stone, nearly concealed by twenty-four shafts which surround it. These are most artistically arranged, both in position, size, and colour. Those occupying the four cardinal faces of the nucleus are 1 foot 5 inches in diameter, and of a rich mottle of crimson, green and white. Those on the diagonal faces (11 inches in diameter) are alternately of white and black, and between these and the great shafts are, in each interval, two smaller shafts ($6\frac{1}{2}$ and $4\frac{1}{2}$ inches in diameter), also black and white, but the colours counterchanged, so that on two sides we have three white and two black and on the others three black and two white. The richly-carved capitals are white, the abacus having a carved cresting of dark marble, the bases (supported by stiff foliage) are of a mottle of black and crimson on a light-coloured plinth. The whole is unquestionably one of the most beautiful combinations of colour to be seen anywhere, and much the same may be said of the three exquisite western portals of the same cathedral, evidently designed by the same hand. The details are for the most part purely French, as is the general design, but the use of polychromatic materials is carried to its fullest extent, as also is the use of that beautiful Italian feature,

the twisted column and moulding. In one of these portals the larger detached shafts are alternately of green and dark mottled marbles; the smaller ones of a red mottle and black. They are placed against a flat splayed jamb of great depth, which is formed of alternate courses of dark and light marble, the light courses being each inlaid with small pattern-work. The bases are white, with the beautiful French enrichment of supporting leaves; the plinth is in courses of various colours, inlaid, dark upon white, and white upon dark. The stones of the arches are alternately dark and white, but in some of the orders the individual bowtills are cut out, and black or white inserted, counter-changing in each course—an exaggeration, perhaps, of the principle, as it infringes a little upon the construction. On the whole, these western parts of Genoa Cathedral are among the most valuable specimens of the art of natural polychromy to be met with in the peninsula, and illustrate the principle of enriching Northern Gothic with Italian ideas, but doing so without infringing upon its essential characteristics.

In the Umbrian churches, as, for instance, those of Arezzo, Assisi, Cortona, Perugia, and Spoleto, stone of a most grateful sepia colour is extensively employed, marble being used for the shafts of portals, windows, and other decorative features. This material is something like our Northamptonshire ironstone, but of a lighter and more delicate hue. Those who know their Perugia and Assisi will recollect those beautiful veneers consisting of rows of ornaments in red Perugia marble and white stone, arranged in the form of a quatrefoil imposed upon a square, that line the exterior walls below the windows in the cathedral of the former, and those of the chapels on either side of the lower church of St. Francis in the latter.

Of the great merit to be found in the architecture of the Middle Ages in Tuscany and Umbria there can be no question; the adventitious aid of beautiful local marbles, the skill of great Italian artists, the effect of climate, and the chisel of the sculptors combined to produce monuments of art singularly grand and imposing, and a debt of gratitude is justly due to those great architects by whose skill such excellent illustrations are handed down to us. But it is still questionable whether the merit of this class of Gothic buildings equals the beauty and fitness always found in the magnificent buildings on this side of the Alps, for, viewing the forms of Central Italian Gothic buildings apart from the advantages of the beautiful material with which they are erected, or their walls encrusted, it may still fairly be questioned whether they are equal to either the French or English examples. There is often a want of purity in their compositions, and some strange admixture of Classical details, which destroys the harmony so remarkable in the best buildings of France and Germany.

(To be continued.)

but history affirms, unfortunately, that the followers of this craft had Whitechapel as their centre. But, in spite of this, it doubtless appealed to the craft as a happy occurrence when John Badly demised to John Hungerford and others, citizens and sheermen of London, a tenement or mansion, shops, cellars, and appurtenances in Minchin Lane, now Clothworkers' Hall. You will grant me, then, a ready connection between St. Mary Woolnoth and Clothworkers' Hall, but how now to connect these with St. Helen, Bishopsgate? Well, this old mediæval London was not the vast and complex city as we know it, and it was the most natural thing in the world for the living of St. Mary Woolnoth to be in the gift of the priory of St. Helen, and such was the case. And now to think first of our church of St. Helen, Bishopsgate.

I suppose I shall not be corrected if I say that, after Westminster Abbey, after the Temple Church, after St. Bartholomew's, Smithfield, St. Helen, Bishopsgate, is the most interesting church in London. Possibly some will even except some of my exceptions. But, after all, apart from its monuments, there is nothing extraordinary about the

DOORWAY ON SOUTH SIDE, ST. HELEN, BISHOPSGATE.—From a photo by Mr. H. F. MURRELL.

ST. HELEN, BISHOPSGATE, AND ST. MARY WOOLNOTH.*

THERE may at first sight appear to be little connection between the places we have visited this afternoon; and, indeed, to tell the whole truth, I fear their choice was largely accidental. I find it possible, however, to trace a certain connection between what might appear such dissimilar objects as a Benedictine priory church, the hall of a wealthy city company, and a late Renaissance church of somewhat clumsy proportions.

There has been considerable dispute as to the origin of the name of our last church, St. Mary Woolnoth and St. Mary Woolchurch Haw, but it is generally granted that these names had their origin in the proximity of these churches to the place where wool was weighed.

Now, it would be easy to assume that the clothworkers naturally worked in the neighbourhood of this wool market,

church. There must have been fifty, there may have been one hundred, churches equally interesting which we could have visited had it not been for the inevitable but irretrievable accident, "the Fire."

It is possible, with the aid of imagination, to connect this church with the very origins of Christianity as a State religion. Its dedication in honour of the canonised Empress Helena, the mother of Constantine, by itself points to an early origin. Helena is frequently claimed as a British lady, daughter of Coel II., Prince of the Trinobantes, but more probably she was a native of Nicomedia, in Asia Minor. The tradition that the original church of St. Helen was founded by Constantine in pious memory of his mother must be accepted with reserve.

For the first certain record of the church we must come to the year 1010, and this incident is confirmed by a record preserved in the archives of the church.

It is a fascinating story. Picture, first, the invasion scare caused by the landing of the Danes in East Anglia; then Alwyne, Bishop of Helmeham, conveying the precious

* Read at a meeting of the Upper Norwood Athenæum, by H. F. Murrell, A.R.I.B.A.

remains of King Edmund the Martyr from Bury St. Edmunds to the church of St. Helen; then the patient vigil of three years while they are guarded for sanctuary in this church.

It is evident that subsequent to this the church was in the gift of the Dean and Canons of St. Paul's, who granted it to one Ranulph and Robert his son.

But the next event of importance occurred in the reign of King John, when the Dean of St. Paul's, Alardus de Burnham, gave permission to William, son of William the Goldsmith, to found a priory of nuns of the Benedictine Order. It is interesting to note that from this William are descended the Earls Fitzwilliam.

Next, in 1308, William de Basing, Sheriff of London, became a most munificent patron of the church, being, in consequence, considered almost a second founder. Doubtless as a result of this generosity the convent flourished exceedingly, becoming possessed of much valuable property in the City.

also in the same wall the two curious recesses, the use of which is a matter for much speculation. With regard to the date of the church, the second arch of the main arcade from the east and part of the chantry at least are of thirteenth-century date, the eastern chapels being built about 1354, and the remainder toward the middle of the fifteenth century, probably the result of Sir John Crosby's generosity.

The crisis of the history of St. Helen's came with the dissolution of the monasteries in 1538, at which time the income of the convent was equal to £10,000 in present money. Following on this haul, King Hal bestowed the conventual buildings on Sir Richard Williams; in 1542 they passed to the Company of Leathersellers, who used the refectory as their hall till 1799, when the conventual buildings were pulled down to form St. Helen's Place.

The church has suffered many restorations, the most productive being that under Inigo Jones in 1631.

The fine work of the entrance porches and doorways at the south and west, and possibly the pulpit, may be attri-

CHURCH OF ST. HELEN, BISHOPSGATE.—From a photo by Mr. H. F. MURRELL

From Prioress Alice Assfeld in 1466 Sir John Crosby obtained a lease of the site of his mansion, so famous since its resurrection in Chelsea.

It is most happy that the memory of this great citizen should be preserved in the very beautiful tomb on the south side of the altar. The very fine effigies of Sir John and Dame Anne, his wife, give some idea of the dignity and knightliness of this great City man.

But we must now trace the effect of the conventual buildings on the general plan of the church. The first thought of anyone entering St. Helen's must be, Which is the nave and which is the aisle? As a matter of fact, though it may sound rather Irish, both the aisles are naves. The southern aisle is the parochial nave, 24 feet wide; the northern aisle is the nuns' nave, 26 feet 6 inches wide. There was dividing these two in pre-Reformation times a screen, removed on the dissolution of the priory. An interesting evidence of the use of this nuns' nave is the arched entrance doorway on the north wall and the curious six-light hagioscope further east to give a view of the high altar from the cloisters during Mass;

but to Inigo Jones, under whose direction a sum of no less than £1,300 was spent.

In 1744 the parishioners, with mistaken generosity, subscribed to erect a west gallery with an organ; in 1865 a more enlightened committee removed the same gallery, and placed the organ in the south transept.

In 1873 the benefices of St. Helen, Bishopsgate, and St. Martin Outwich were united. As a result of the removal of the eighteen principal monuments of St. Martin Outwich, St. Helen's is remarkably rich in monuments. It has been designated "the Westminster Abbey of the City." I will endeavour to concentrate on a few of the most remarkable of these.

To proceed chronologically, there are in the floors of the chapels eight brasses.

A merchant and his wife, dating about 1400.

A lady of the time of Henry VII. in elaborate robes, probably a Lady Abbess.

John Briéux, rector of St. Martin Outwich, 1459.

Nicholas Wotton, rector of St. Martin Outwich, 1483.

Thomas Williams, gentleman, and Margaret, his wife, 1495.

John Leventhorpe, Keeper of the Chamber to Henry VII. 1510.

Robert Rochester, Sergeant of the Pantry to King Henry VII., 1514.

Thomas Benolte, Clarencieux King-at-Arms, A.D. 1533 (lost).

In the Lady chapel is also the early monument of Sir John De Oteswich, of early fifteenth-century date.

He was connected with the foundation of St. Martin Outwich, from which church his monument was moved in 1874.

To quote Stow on the subject:

"On the south part of Which Street (Threadneedle Street), beginning at the east, by the well with two buckets now turned to a pump, is the parish church of St. Martin called Oteswich, of Martin de Oteswich, Nicholas de Oteswich, William Oteswich, and John Oteswich, founders thereof." He continues that John Oteswich and his wife were buried "under a fair monument on the south side."

The monument of Alderman Hugh Pemberton, 1500, is another of the removals from St. Martin. He appears to have been a dignitary of the City, merchant taylor, and Sheriff in 1490. His effigy, and possibly that of his wife, has disappeared.

Next in antiquity comes Sir Andrew Judde, represented in armour kneeling. He was Sheriff in 1544 and Lord Mayor in 1550; also Lord Deputy and Mayor of the Staple of Calais. He seems to have made his fortune trading in furs in Russia and Muscoua. Hence his inscription:

To Russia and Muscoua,
To Spayne, Gynny, without fable,
Travelled he by land and sea,
Both mayre of London and Staple.
The Commonwelthe he norished
So worthe in all his days,
That ech State full well him loved,
So his perpetuall prayers.
Three wives he had; one was Mary;
Fower sunes, one mayde, had he by her.
Annys had none by him, truly;
By Dame Mary he had one dowghtier.
Thus in the month of September,
A thowsande, five hundred fifye
And eight died this worthe stapler
Worshipynge his posteritye.

And now we come to a very fine series of Elizabethan and Jacobean monuments. The earliest of these, and, indeed, one of the finest Elizabethan monuments in the country, is that of Sir William Pickering. This distinguished knight, scholar, and soldier appears to have served no less than four Sovereigns—Henry VIII., Edward VI., Mary, and Elizabeth, the latter as Ambassador at Madrid. His effigy is a fine illustration of the dress of the period. Here he lies clothed in armour, with trunk breeches and the distinguishing neck ruff.

In the centre of the Gresham Memorial Chapel at the extreme east of the nuns' nave lies the altar tomb of Sir Thomas Gresham. From the corner of the adjacent window hangs a helmet, reputed to have been carried at his funeral.

The greatest merchant of his time, his name is perpetuated as the founder of Gresham College and the Royal Exchange. The only grudge St. Helen's can bear against him is that in his will he appears to have omitted to provide for the new steeple which, according to Stow, he promised to build in recompense of ground in their church filled up with his monument.

Slightly later in date is the monument of Alderman John Robinson, 1599.

These must have been great and prosperous days, free from all anxiety over the decline of the birth-rate. In the left panel kneels Alderman John and his nine sons; in the right kneels Christian, his wife, and her seven daughters. "They spent together," we are told, "thirty-five years in holy wedlock, and were happy besides other worldly blessings in nyne sonnes and seaven daughters."

But we must not forget Sir Julius Caesar Adelmare—indeed the type of man who does not allow himself to be forgotten. His Latin inscription has been translated thus:

"To all faithful Christian people to whom this writing may come. Know ye that I, Julius Adelmare, alias Caesar, Knight, Doctor of Laws, Judge of the Supreme Court of Admiralty of Queen Elizabeth, one of the Masters of Requests to King James and of his Privy Council, Chancellor

of the Exchequer, and Master of the Rolls, by this my act and deed confirm with my full consent that, by the Divine aid, I will willingly pay the debt of Nature as soon as it may please God. In witness whereof I have fixed my hand and seal. February 27, 1634."

It is interesting to note that the seal is represented as severed from the deed.

The monument of Sir John Spencer has special interest for us this afternoon, as he was Master of the Clothworkers' Company, and in 1594 Lord Mayor of London. He seems to have gone by the name of "rich Spencer," on account of his vast fortune. From him is descended the Marquis of Northampton.

It is impossible to mention half the monuments of this wonderful church, but we must just remember that of Francis Bancroft, who must have been as much a character in his way as Julius Caesar Adelmare. He erected during his lifetime a large, ugly, and very-much-in-the-way tomb, provided with hinged cover to facilitate a periodical inspection of the embalmed corpse, with this inscription:—

"The ground whereon this tomb stands was purchased of this parish in MDCXXIII. by Francis Bancroft, Esq., for the interment of himself and friends only, &c."

The officials of the Drapers' Company, to whom the pleasant duty of a periodical inspection of Mr. Francis Bancroft fell, stuck gallantly at their task for some time, but Mr. Bancroft's embalmer had played him false, and the duty became impossible. At the last restoration his large tomb was removed.

Much as we would like to linger over St. Helen's, if not over Bancroft, we must move on to

Clothworkers' Hall.

"The grandeur of England is to be attributed to its golden fleece, the wealth of the loom making England a second Peru, and the back of the sheep, and not the extracts of the earth, being its chief mine of riches."

Some of us, still conscious of the inconvenience of a coal strike, will hardly agree, so far, with Mr. Elkanah Settle, but all of us must acknowledge a debt to the clothworker and, incidentally, to the sheep of the golden fleece.

Though ranking as the twelfth and last of the great Livery Companies of London, it is in its origin one of the most ancient and, indeed, one of the most useful and powerful of the companies. There are many of the companies associated with the clothing trade—the Drapers and the Merchant Taylors, for instance. The Clothworkers were formed by the union of the Guilds of the Fullers and Sheermen, who, in their turn, were derived from the ancient Anglo-Norman Guild of Tellarii, or Wool-weavers. The Weavers were ultimately absorbed into the Drapers and Merchant Taylors.

We must recognise that the large connection of the clothing trade of this country with the Continent is of ancient origin; the latest creation of Paris in hats and otherwise has always been an English hobby. Hence this trade was peculiarly in need of some form of protection, the wise oversight of a union to insure that alien goods and alien workers should conform in some measure to British standards. It was, as already mentioned, in the reign of Henry VI. that John Badly demised to John Hungerford and others, citizens and Sheermen of London, a tenement or mansion, shops, cellars, and appurtenances in Minchin Lane. Edward IV. granted "to his beloved lieges to found, to the praise and honour of God, and the most glorious Virgin Mary His Mother, a certain fraternity or perpetual of the men of the mystery of Fullers."

"Unto his beloved lieges, men of the mystery of sheermen," King Henry VII. granted a charter of incorporation.

The charter of 19 Henry VIII., January 18, 1527-8, commences by rehearsing the circumstances under which Henry VII. and other Sovereigns had previously accorded privileges to the Sheermen and Fullers, and proceeds to transfer and change the two guilds into "the name of one master and four wardens of the Guild or Fraternity of the Assumption of the Blessed Virgin Mary of the Art or Mystery of Clothworkers of the City of London." It also provides, among other things, for the exercise of a common right of search over aliens' denizens and punishment of offenders or defaulters according to the law of England or the custom of London in all matters pertaining to the mysteries of Sheermen and Fullers, &c. It is interesting to note that females have always been entitled to the freedom of this company. I wonder if the Glassworkers have a similar open door to the fair sex.

An old dispute as to precedence in the Lord Mayor's procession was settled in 1518 by Sir William Boteler, Lord Mayor, who decided "that the Sheermen should ride first,

and that the Dyers should lovingly and charitably follow the fellowship of Sheermen without any further strife or debate."

Amongst the ordinances of the company commencing 1531-2, the following, amongst other subjects, are dealt with: Election of officers, livery of clothing, rendering of accounts, relief of necessitous brethren, and their burial out of the common box, dirges and masses for their souls, the attendance of members at the obsequies of a brother "in their best apparel." There are also provisions regulating details of work and hours of attendance, and forbidding men of the mystery to play at unlawful games. In 1607 King James I. was made a freeman. When entertained at the hall His Majesty was pleased to drink to the Lord Mayor, Sir William Stone, and the rest of the company "by the name of his good brethren the Clothworkers, praying to God to bless all good clothworkers and all good clothwearers."

And now we are coming to great and stirring times. A minute of the Court dated September 7, 1643, reads:—

"This day also this Court, taking into their sad and serious consideration the many great, pressing, and urgent

Pepys' note of September 6, 1666, is interesting. "Strange it is to see Clothworkers' Hall on fire these three days and nights in one body of flame, it being the celler full of oyle."

The building which succeeded the one destroyed by the Fire seems to have been worthy of the company. Hatton in his "New View of London, 1708," describes it as a noble, rich building. "The hall is a lofty room adorned with wainscoting to the ceiling."

This old block was taken down in 1862.

The company has had many distinguished masters.

William Lambe, a suitable name for a Master of Sheermen, was Master in 1569-70. Lamb's Conduit Street is named after him.

Sir John Spencer, whose monument we have already noted at St. Helen's, and, greatest of all, Samuel Pepys, the famous diarist and Secretary to the Admiralty, who signalled his year of office by presenting the company with its treasured loving cup.

A word in conclusion as to income and good works. The total income of the company is about £60,000. Out of this

INTERIOR OF ST. MARY WOOLNOTH.—From a photo by Mr. H. F. MURRELL.

occasions which they have for money, as well as for the payment of their debts as otherwise, and considering the danger this city is in by reason of the great distractions and civil wars of this kingdom, have thought fit and so ordered that the stock of plate which this company hath shall be forthwith sold at the best rate that will be given for the same."

A subsequent Court minute shows that 2,068 ounces of plate were sold, which realised £520, and 1,239 ounces were retained for the use of the company. The rose-water dish given by John Burnell, Master, in 1593, survived this crisis.

Then, again, later the records of the company reflect contemporary history in 1660, when an item appears "to put out and remove the arms of the Commonwealth from all things belonging to the company, and to set in their stead the arms of His Majesty."

There is an old map of London published by Agas about 1560, which shows Clothworkers' Hall before the Fire. Evidently it was rather fine. In the stained glass windows of the refectory, we are told, were the arms of ten Lord Mayors and sixteen Sheriffs who belonged to the fraternity.

income many exhibitions and scholarships to the Universities are made. The amount of its subscriptions to technical education is about £4,000 annually. But the company has particularly interested itself in the higher education of women and in the care of the blind. It supports nearly 1,000 blind pensioners receiving from £5 to £20 each.

It is altogether a fascinating history, a movement originating in the ancient Guild of Fullers gathered at Whitechapel, round the field where grew the Fullers' teasel, developing into the larger company for trade protection, flourishing under Royal patronage till it becomes the great company whose good works for beneficence and for the progress of industry touch a thousand lives and assist a thousand progressive interests.

St. Mary Woolnoth.

Here we are right at the heart of the City, surrounded by all the throb of its life, splashed by its motor-buses, shaken by its tube railways. "Near to the place where wool was

weighed, a beam in the churchyard," says Stow, "can you see the bales dragged in from the country across quaint old London Bridge. Right at the corner of Lombard Street can you see the dark-skinned Italians from Lucca, from Florence, from Venice, who came here with their bills of exchange when the Jews were driven out from Old Jewry in the thirteenth century."

It is the Lord Mayor's Church, they say, and no wonder, for St. Mary Woolchurch Haw probably stood on the site of the Mansion House.

Of the original foundation of the church nothing is known.

"In the year 1438 it was rebuilt," Newcourt says, "from its very foundations." This rebuilding does not seem to have been completed till the end of the century, as Stow says, "Sir Hugh Brice, Goldsmith, Mayor in the first year of Henry VII., Keeper of the King's Exchange at London, and one of the Governors of the King's Mint in the Tower of London, built in this church a chapel called the Charnell, as also part of the body of the church and of the steeple, and gave money toward the finishing thereof, besides the stone which he had prepared."

The living, which, as already mentioned, had been among the possessions of the Priory of St. Helen's, was granted by Henry VIII. to Sir Martin Bowes, whose mansion stood adjacent. His visor, gauntlets, and spurs are preserved in the case in the church.

This old Gothic church, first rebuilt in 1442, was altered and almost entirely rebuilt in 1620.

From this it would seem that we did not lose much by the Fire, though Stow speaks of the church as "reasonably fair and large." Naturally, they were short of churches after the Fire, and in 1677 St. Mary Woolnoth was repaired, the sides, roof, and part of the ends having been "damned" in the Great Fire.

Malcolm also gives particulars of what happened. "The north wall fronting Lombard Street and 6 feet of the east wall were erected. All the remainder of the walls of the old church were left ruinous, in order to render the interior fit for Divine service as speedily as possible; but the very consequence of this haste became visible before 1711, in which year the parishioners were apprehensive of being buried by its fall."

Wren was a generous critic, even to his brother architects, a sign of supreme grace.

Thus reads his "Parentalia":

"The steeple was old, and wanted rebuilding, which, together with the whole church, is now very substantially performed by the ingenious and skilful architect, Mr. Nicholas Hawksmore."

Very substantial is certainly a suitable description of the twin towers.

The rebuilding commenced in 1716, and was completed about 1719.

The plan of the interior is clever, the twelve Corinthian columns in groups of threes proving very effective without interfering with the value of the interior as a preaching church. The four semicircular windows above the entablature light the church in a very happy manner. The wood-work of pulpit, organ, and gallery fronts is good. The galleries were removed at a late restoration, and the pilasters now stuck against the wall are of questionable decorative value. The organ built by Schmidt was removed to its present position when the galleries were removed.

Cowper's friend, John Newton, once "infidel and libertine," was rector of the united parishes for twenty-eight years.

There are interesting documents now hanging on the south wall of the church. The most ancient dates from about 1290, bequeathing a small sum of money to the church. Externally it is a striking composition, but rather heavy.

Mr. Nicholas Hawksmore was a little too clever. His north front was carefully designed with niches and Ionic columns; his south front was left barefaced. When King William Street was cut through to the bridge this parsimony was revealed, this side being now the more important elevation.

St. Mary Woolnoth, on account of the great value of its site, has been in continual danger of demolition. Crowded about as it is by tube stations, it has been, and is still, looked upon with hungry eyes.

May we hope that this Woolchurch lamb may long be spared from the devouring commercial wolf, to remain a quiet spot for the neurotic City men of the twentieth century, a thing of beauty and a joy for ever to the antiquarian

LADY ARTISTS AT THE BAILLIE GALLERY.

THERE are, in fact, four self-centred shows at this gallery, three of them the work of ladies and one supplied by a man; but with the latter and with one of the ladies this notice is not concerned.

Mrs. Mary F. Raphael's works are evidently appreciated; for of the sixty-seven shown as many as thirty-one were already sold when we paid a week-belated visit. Of these sketches "At Home and Abroad" we prefer the French studies; the Italian work lacks the brightness of atmosphere associated with the Sunny South; we would, however, draw attention to the "Canale Madonetta, Venice," which is an interesting side "street" in the city of canals, or it is made interesting through Mrs. Raphael's clever brush-work and vigorous chiaroscuro. "Wisteria, Venice," is distinctly good. The Fontainebleau group merits our cordial approval; there is the charming "Moat," with its nice sunny effect and good water-reflection, and there is "The Palace," a striking architectural morceau, showing the palace angle filling in the background, and well reflected in the satisfactorily portrayed water; the picture composes well as a whole, with groups of trees to the right and left. Again, there are "The Lake" and "The Path of Orpheus," the latter's colour scheme being noticeable for the grey of the pathway being carried on and up the bank amidst the green. There are other Fontainebleau sketches which we must pass over in our haste to draw attention to "The Stagnant Fountain, Versailles," which we regard as one of Mrs. Raphael's happiest efforts (though "effort" is not the right word to employ for such an obvious success); it is poetical and full of the mystery provided by a gloom-haunted spot. Two sketches of the sand dunes at Le Touquet call for special notice. "A Sunny Path: Roses and Forget-me-Nots," has very pretty colouring, and the pergola effect is attractive. The last picture to which we can devote space is "The Concierge," showing a white poodle in a doorway; the work is good in tone, sunshine study, and general effect.

The outstanding quality of Mrs. Humphreys-Williams' sketches is the softness, which is so much in evidence, a quality that may easily pall, however. But there are numerous exceptions. "Lierna, Lake Como," is very vigorous, and is one of the premier works in point of merit. "Between Winchelsea and Rye" must receive similar comments; in fact, the Rye and Como sketches stand pre-eminent amidst the work shown. "Port of San Giovanni, Lake Como," is a little too clear-cut to be quite satisfactory. "Lake of Piano" composes well, and "In the Fluela Valley" is very good, with its snow-clad mountains and blue-grey foreground. "From Menaggio, Sunset," has very pretty colouring in pinks and yellows. In the "Swiss Chalets, Davos," the mountains are very well put in as background. "King Cups" shows the flowers and foreground satisfactorily painted, but the sky and trees are poor. Altogether, the exhibitions by these two lady artists prove sufficiently interesting.

The Allied Artists' Association.

SIR.—Although there is hardly a word in your article with which I agree, I am nevertheless obliged to you for inserting it, as we appreciate candid criticism; but I do wish you had mentioned the few architectural designs.

The architect invariably complains that his work is neglected by the Art Associations, so this year we notified some 6,000 that we would be willing to exhibit their work of any size, and the response was nil. Our offer is still open for next year, so I think that after this they can hardly have further cause for complaint.

Whether the paintings are good, bad, or indifferent does not affect the question, and, of course, judging by the sales here, everybody, luckily, is not of your opinion as to their merits. Perhaps in the interests of architecture you might care to make this known to your readers.—Yours faithfully,

ERNEST A. McCANN.

Secretary, Allied Artists' Association, Ltd.

OLD SERJEANTS' INN.

As all Londoners know, there are, or have been, two Serjeants' Inns in London, the one in Chancery Lane, the other in Fleet Street, but at one time there were four if not more hostels used by the serjeants and judges. There are now no more serjeants-at-law, for under the operation of the Judicature Act of 1873 the special privileges of the serjeants practically ended, and Baron Huddleston, the last baron of the ancient Court of Exchequer, was apparently the last serjeant-at-law to be created. The privileges of the serjeants were considerable, as, firstly, the order of the coif was a necessary stepping-stone to the Bench, for, as Sir John Fortescue, who was made *Chief Justice of the King's Bench* in 1442, says: "None shall be exalted to the bench without first taking on him the degree of serjeant, nor can he receive this degree without having studied the law at least sixteen years." The mark of the degree was the wearing of a white silk coif, from which the rank was often described as the order of the coif. Another privilege of the order in ancient times was that its members were free from the disability of King's Counsel to appear against the Crown, and the penalty of vacating their seat if members of Parliament. In the reigns of Edward VI., Elizabeth, and James I. the Speaker of the House of Commons was almost always selected from the Serjeants-at-Law.

Old Serjeants' Inn in Chancery Lane was at the close of the fourteenth century a hostel known as Faryngdon's Inne in Chancellor's Lane, which latter is supposed to have been named after a bishop of Chichester who lived there and was Chancellor about 1292. The chapel for the custody of the Rolls and Records of Chancery was built adjacent to the Inn by Henry III. It is probable that Robert Faryngdon, who gave his name to the Inn and was a "Clerk of the Chancery," held the Inn on behalf of Judges and Serjeants. He is named in a deed of 1404. In 1414 the Bailiff of the Bishop of Ely rendered an account for the repair of a chamber occupied by one Walter Askham, an apprentice or student of the law, and shortly afterwards the entire hostel was demised to "Judges and others learned in the law." So that during the fifteenth century, at any rate, this Inn was recognised as the appropriate residence of the judges and leaders of the Bar. In 1484 there was granted to Sir Thomas Grey a lease of the "Hostel called Serjeants Inne in Chancellor's Lane," from which time forward the premises were known as Serjeants' Inn.

The popularity of Serjeants' Inn appears to have led to a certain amount of overcrowding, for by a deed of 1618 the Earl of Cumberland demised to Sir Lawrence

Tanfield, Chief Baron of the Exchequer and other Judges and Serjeants-at-Law, part of Clifford's Inn Garden, adjoining, in the following terms: "Know ye that we for the especial love which we bear to the Justices of the Lord the King and Serjeants-at-Law now dwelling in the Serjeants' Inn in Chancery Lane, London. And being willing to show them special favour and that successively henceforth as well the said Justices of the Lord the King and Serjeants-at-Law who now dwell in the said Inn as others who shall in future abide in the said Inn may have a certain part of a certain garden called Clifford's Inn Garden, in which they may walk agreeably for their better health, and that they may enjoy the benefit of the air which now they have not or otherwise dispose of that part as to them it shall better seem to be expedient."

The Serjeants' Inn in Fleet Street was a collateral of the older establishment in Chancery Lane until 1758, when the Fleet Street members joined the Inn in Chancery Lane, which continued the head-quarters of the Serjeants' fraternity till the extinction of the order.

The buildings of Serjeants' Inn had necessarily been rebuilt and altered many times during the six centuries that it was occupied by the Judges and Serjeants-at-Law. The Hall was rebuilt in 1678, and on the exterior of it were two decorative panels bearing this date and the royal badge with the monogram of Charles II. The chief feature of the interior seems to have been the stained glass in the windows with armorial bearings of members of the Inn.

Amongst the historical events associated with Old Serjeants' Inn was the judicial commission held to settle the boundaries of London after the Great Fire of 1666. On this commission sat Sir Matthew Hale, one of the most eminent judges of his day, to whose impartiality and ability were no doubt largely due the general satisfaction which was given by the Commission's settlement of the boundaries and of conflicting claims.

Many celebrated judges and eminent lawyers have been connected with Serjeants' Inn. Sir Thomas Littleton, the author of the celebrated "Treatise on Tenures," was called to the degree of the coif in July, 1453, and Sir Edward Coke, the author of the legal classic "Coke upon Littleton" is believed to have resided in Serjeants' Inn.

Other historical associations and records of eminent members are to be found in a charming and well-illustrated brochure on "Old Serjeants' Inn, Chancery Lane," privately printed for the Law Union and Rock Insurance Company, Ltd., from which we have gathered many of the particulars in this article.

Old Serjeants' Inn was purchased by the Company and pulled down to make room for the new building which forms the subject of our plate illustrations this week.

SOME OF THE GREAT HOUSES OF NORTH-AMPTONSHIRE.*

THE county of Northampton is particularly rich in noble buildings. Its spires and its squares have long been famous, and it is not therefore surprising to find that the churches belonging to the spires and the houses belonging to the squares are worthy of more than passing notice. It is hardly necessary in the present day to insist upon the benefit and pleasure to be derived from the study of ancient buildings. They are in themselves generally so beautiful as to attract the notice of even casual observers, but to those who know how to read the language written in their carved stonework what a series of pages in the book of history do they unfold. Particularly is it so with the churches. They indicate the existence of thriving communities over the greater part of the county since the time of William Rufus, and in places even before Harold fell at Hastings. Century after century

attention. This movement was felt in Northamptonshire as much as in any part of the country. Holdenby, Kirby, and Burleigh, each a palace of the first rank, were among its direct results. Rockingham Castle was enlarged; so were Drayton, Rushton, Apethorpe, and Canons Ashby; Dingley Hall was built, besides many manor houses of less degree.

Let us first go to Rockingham. This is the oldest of all the places that we shall visit, for the Castle was founded by the Conqueror himself. Its records are continuous, although of no great popular interest. They are, in fact, chiefly lists of custodians of the Castle and of the sums disbursed for repairs. One important event, however, stands out from these petty details as early as the year 1095, in the reign of William Rufus. Rockingham, it must be remembered, was a Royal castle, and its principal purpose was to serve as an abode for the King when he came to hunt in its great forest, which then covered the whole of the northern part of the

KIRBY HALL.—PORCH IN COURTYARD.

were they altered, enlarged, and improved; slowly monument was added to monument until that great epoch in the history of buildings, the Reformation, of which an early event was the Dissolution of the Monasteries. With this event church building practically ceased, and house building began. No further alterations, enlargements, or improvements were made in the churches. The monuments, it is true, still grew in number. But the revenues which formerly went to the great Roman Catholic Church were now diverted into private hands, and by them chiefly employed in building, altering, enlarging, and improving—not churches, but houses. A great era of house building began, which lasted from the middle of the sixteenth century till the Civil Wars of the next century engrossed everyone's

county. On the fifth Sunday in Lent, or, to be more definite, on March 11, in the year 1095, a solemn meeting of all the nobles and prelates of the land was held at Rockingham for the purpose of considering a very important question—namely, whether or no Archbishop Anselm had been a traitor to the Crown in accepting his office from Pope Urban II., whom the King had not officially recognised, for there were then two rival Popes. A meeting of all the nobles and prelates in those days was nothing less than a conclave of all the power and intellect of the country, and we may safely say that in the present day no meeting has ever been held that brought together so much of the real strength of the land. The question at issue warranted it, for in the point to be settled was involved the relation of the secular power to the ecclesiastical. Pope or King, which was to be obeyed? This momentous question which troubled England continually till Henry VIII. settled it once for all was discussed with all

* A Paper by Mr. J. Alfred Gotch, F.S.A., read on July 26 at the meeting of the Royal Archaeological Institute held at Northampton.

gravity on that Sunday in March more than 800 years ago, with the result that, while deeming the Archbishop to have been wanting in respect to the King, the assembly did not pronounce an opinion as to his relations with the Pope. This somewhat lame and impotent conclusion was shortly followed by the official recognition, which had hitherto been withheld by the Monarch. Beyond this great Council, no event of the first importance is recorded of Rockingham. All the early Kings came down there to hunt, but never again did its walls behold so brilliant an assembly; and its history is made up of petty details of forest administration till the time of James I., in whose reign it was granted to the ancestors of the present owner, and since that time its records have been of a domestic nature.

At Drayton we have not anything like so old a foundation as at Rockingham, but the oldest parts of the house are about the same age as the archway at Rockingham, for we learn

Sackville, from whom the present owner is descended. Drayton has played no part in history, but none the less it is an eloquent witness to the long series of changes of which history is the record. Here you may see the battlemented walls and the vaulted passages of the stern times of the Edwards; the tall chimneys and long gallery which were the fashion in Elizabeth's days, as well as the vaulted cellars, across which the dim light struggles on to mighty barrels of ale; here you may see the sashed windows, the great pediment, and the spider-legged cupolas that were erected to do honour to William and Mary when they came to visit Drayton. Elsewhere the wood fittings tell of changes made when good Queen Anne sat upon the throne, while the beautiful ironwork that stretches from one grey wall to another, and the long formal walks of verdant turf, and the great trimmed hedges of yew, and the banqueting houses, remind us of the days when Lady Betty Germaine used to make apricot jam.

KIRBY HALL.—GATEWAY IN OUTER COURT.

that in the year 1328 Simon de Drayton obtained a licence to crenellate his house at Drayton, and to impark a certain number of acres, so that the bulk of the outside walls come down to us from the time when an Englishman's house was in very truth his castle, the object of which was scarcely more to shelter himself than to annoy his neighbour. Since that time Drayton has never been sold nor alienated, but has always passed from owner to owner, either by inheritance or gift. Many men have been lords of Drayton. The De Veres, of whom Simon de Drayton was one, held it first; from them it passed to the Greenes, some of whom lie buried in Lowick Church under as fine monuments as any in the land; from them it went to John Stafford, Earl of Wiltshire, and from him to the Mordaunts. The Mordaunts held it till about 1700, when it passed by marriage to Sir John Germaine, who left it to his widow, Lady Betty Germaine, the friend of Horace Walpole; she, in her turn, left it to Lord George

Drayton was in some sort connected with Rushton at one time, for one of the Veres of Drayton married a sister of John Tresham, of Rushton, who stands out from the faded canvas of antiquity by reason of two letters of his which have been preserved, and show him to have been a very common-place man, subject to like passions and infirmities with ourselves. In one, written about the year 1500 to his brother-in-law, Sir Henry Vere, of Drayton, he says he returns "your Aporne and Gussets of Mayle" and offers to buy them at any price that Sir Henry may think fit. Then presently he goes on to beg the loan of five marks, "or else that ye will send me forty shillings, for it would do me great ease now and I have need thereof." The second letter, written a day or two later, begins, "Right Worshipful Brodyr, in the most loving wise I recomend me unto you and unto my sister your wife, and brodyr whereas I sent yow word by your servant to have been with yow as this day,

I pray yow to take it for noon unkindnesse that I come not, for I have such a soresnesse in my throat that hit grevys me to speake or to swallow anything, and the wether is soe farvente colde that I dare not aventure forth."

This same John Tresham was also a party to a curious deed, which throws some light on the way in which people used to dispose of their daughters in those days. It also tells us how it was that the Mordaunts became connected with

He himself soon became a grandfather, for people married early in those days, and his son's son grew up to man's estate in the lifetime of his grandfather. The youth's own mother died, and his father married again; this time a widow with daughters of her own. They all lived together at Drayton, and the natural consequence was that the lad Mordaunt fell in love with one of his new connections. This, however, did not at all suit the grandfather, who, it will be remembered,

RUSHTON HALL.—NORTH-WEST CORNER OF COURTYARD.

Drayton. The other party to the deed was John Mordaunt, a Serjeant-in-the-Law to King Henry VII. John Mordaunt on his part agrees to do his best to bring about a marriage between his two sons and two daughters of Tresham's sister, Lady de Vere, to whose husband, Sir Henry, the two letters were written which we have just read. He is also to endow them with a certain sum per annum. In return for this,

had his wife chosen for him by a judicious parent; moreover, the match was not a good one, and so the grandfather would not hear of it, and then chaos ensued, and there within the grey walls of Drayton, far off in the sixteenth century, were all the miseries and passions which swell the modern novel. The details of the tragedy are wanting, but we learn that the match never came off, for young Mordaunt married

CANONS ASHBY.—THE GREEN COURT AND HOUSE.

John Tresham on his part agrees to give John Mordaunt the refusal of any land that Tresham may be desirous of selling. This compact was carried out, at any rate so far as concerned the marriage of young Mordaunt with the elder daughter of the de Veres, and in course of time young Mordaunt, in right of his wife, stepped into the inheritance of Drayton, where he and his descendants remained for many generations.

a Miss Darcy of the North, and lived in great state and bounty at Drayton, to which he afterwards built a large wing. And the step-sister, what of her? Possibly her skeleton may be found at Drayton some day, possibly her ghost still haunts the ancient towers; or perhaps (which is still more likely) she married some wealthy knight from a distance, and lies buried side by side with her husband,

under a handsome Elizabethan tomb, with their twenty children accurately arranged beneath them in two neat rows of sons and daughters.

But we must not linger too long at Drayton; neither with the Mordaunt, Earl of Peterborough, who, under the name of Halstead, caused to be compiled the genealogies of his race—a sumptuous volume of which only twenty copies were printed; nor with Sir John Germaine, who laid out the

when a Tresham was Speaker of the House of Commons. The end of this unfortunate gentleman was sad; he was travelling home to Sywell from the town of Northampton, when, as he was saying his matins on the way, being a little in advance of his servants, some retainers of one of his enemies thrust him through with a spear and so left him. His servants coming presently up to where he lay, found him in this sad plight and carried him back to Northampton, where they cut

BOUGHTON HOUSE.—THE STABLES.

gardens in the formal Dutch style which they wear, even now; nor with his widow, Lady Betty, who has left an excellent recipe for apricot jam, and who was mistress here when Walpole paid his flying visit, and rambled all over the house, and was better pleased than with any other place in the county, which he unjustly stigmatised as dull. These matters we must leave, and hurry away to the home of that John Tresham whose acquaintance we have already made,

off each end of the spear; but this attempt at a remedy was ineffectual, for on the truncheon being pulled out the poor man died. His son fared little better, for he lost his head after the fight at Tewkesbury, in the Wars of the Roses. The next Tresham was our acquaintance with the cold, who built a large part of Rushton Hall, as well as a smaller house at Lyveden. But the most famous of all the race was this John Tresham's great-grandson, Sir Thomas, who not only added

DEENE PARK.—EAST FRONT.

when the weather was "soe farvente colde," and he had such a sore throat. We will, therefore, turn our steps to Rushton.

The Treshams were one of the most noted families of the county. They had possessions in half the parishes of the northern part. They had houses at Sywell, Rushton, Lyveden, Newton, and Pilton. They played a conspicuous part in the history of the county, beginning in the reign of Henry VI.,

to the house begun by his ancestor, but also built the Market House at Rothwell, the very curious Triangular Lodge, and the new building at Lyveden.

The peculiar bent of his mind is further shown in the new building at Lyveden, which sets forth the doctrine of the Passion. Here we have a building of the shape of a cross on plan, with each side of each arm equal. The cor-

nices are decorated with carved symbols of the Passion, the cross, the crown of thorns, the hammer, the nails, pincers, sword, spear, lantern, and the sword of Peter with the ear

BOUGHTON HOUSE.—CHIMNEYPIECE IN GREAT HALL.

of Malchus adhering to it. This place was evidently meant as a dwelling-house, but whether for Sir Thomas himself or for priests we cannot tell. But however this may be, these buildings of Sir Thomas Tresham will long remain to pre-

GATEWAY.—DRAYTON HOUSE, NORTHANTS.

serve his memory as an ardent advocate of his religion, and one who was not afraid to suffer for the principles he professed; and, whatever those principles may be, there is something noble in doing that.

Let us now return to Rushton. We have said that Sir Thomas added to the house of his ancestors; his work not only

bears the date of 1595 on it, but also the arms of Tresham, the three trefoils. Near to it is other work, bearing later dates, 1610, 1626, 1627, &c., and, moreover, no longer displaying the trefoils of Tresham, but a different device—that of the Cokaynes. In this change we find an intimation of one of the most notable events in English history. Why have the trefoils of Tresham given place to the cock of the Cokaynes? Because of Gunpowder Treason. Sir Thomas the builder died in September of 1605; two months later his son Francis was in prison for being concerned in the great plot, his estates were confiscated, and the glory of the family was departed. Rushton passed away from the Treshams for ever, and was bought by the Cokaynes. They continued the building operations which were then in progress, and gave to the house the aspect with which we are familiar. At Rushton the Cokaynes remained till more than a quarter of the last century had passed, and then the place was sold. The Cokaynes, or Viscounts Cullen, as they became, were a hard living race, not a little given to extravagance, and to one of them occurred a somewhat startling incident. It was the second Viscount Cullen, who in 1651, being then sixteen years old, was betrothed to a great heiress four years his junior. In course of completing his education he made the tour of the Continent, as was the fashion in those days. Beneath the

ARMS OF FANE IMPALING NEVIL, FROM CEILING OF DINING-ROOM, APETHORPE HALL.

genial influence of Italian skies he so far forgot his northern heiress as to make love to an Italian lady of high birth—a princess it was even said. However, the time of his sojourn expired, and he returned to his native country alone, and in due course proceeded to fulfil his engagement to the heiress. The festivity was at its height, the great hall at Rushton rang with the sounds of mirth, the cup was circling freely, when there dashed up to the central door of the long corridor a chariot drawn by six horses, from which alighted no other than the slighted princess. She made her way to the feast, seized the great golden cup, and emptied its contents to the perdition of her rival. Then, falling on her knees, she invoked the most terrible curses on the happy pair, and solemnly prophesied that the bride should "live in misery and die in want." This done to her own satisfaction and the consternation of the company, she retreated to her chariot and returned to her native land, and never emerged from her obscurity again. A prophecy founded on knowledge such as the princess possessed on this particular occasion, and delivered in such circumstances, was calculated to work its own fulfilment, and it is recorded that the Viscount, being of extravagant habits, did indeed lead his wife a sad life, and that "the beautiful Lady Cullen," as she was called, actually died in Kettering in a state of great poverty. It is pleasant

to turn from these tragedies to the days of an earlier Viscount, the father of the faithless lover, and to picture his friend the poet Dryden pacing the avenues of the Rushton gardens while engaged upon his poem of the "Hind and Panther." Dryden was a native of this county, having been born at Aldwinkle All Saints, the twin village of that in which Thomas Fuller was born, and it is fitting that he should remain in our memories associated with the beautiful home that once belonged to Sir Thomas Tresham, than whom no man has shed more lustre on the county.

But we must make our way to Dingley, which is on the north-west borders of the county not far from Market Harborough. The house dates from two periods, principally from the time of the Georges, but also in places from the middle of the sixteenth century. It is the latter work which is of chief interest to us. The extent of it shows that the

been carved by some very ignorant person, to judge from the terrible mess he has made of some of the words. However, when rescued from the distortions which this artist caused, the sentences run thus, some in Latin and some in English: "Anno 1560. Go contented with thy lot. Let not the cobbler concern himself with aught beyond his last. It is better to die virtuously than to live dishonourably. That that thou doest, do it wisely, and mark the end and so forth. Watch men, for time flies with a silent foot, and the years go by without a sound. If God be with us who shall be against us? God save the King. 1560." The King in 1560—who was he? Are we to gather from this that Edward Griffin still regarded Philip as the king, although Elizabeth had been already two years on the throne? If so, it is well for Edward Griffin that the queen did not honour him with her presence on one of the numerous progresses which she

APETHORPE HALL.—SOUTH-EAST CORNER.

original house was of considerable size, and we learn that it was built by Edward Griffin, who was Attorney-General to Queen Mary. It is of unusual interest in one respect—namely, that on its porch is an inscription setting forth that it was built "Anno 1558 in the rayne of Felep and Marey." Not many buildings are to be found with that statement on their face, for the reign of Philip and Mary was short; and, indeed, we are hardly accustomed to think at all of Philip being recognised as the real King of England. Besides the date of its erection, the porch bears other inscriptions; the initials E.G., for Edward Griffin, and A.G., for his wife, as well as the motto "After darkness cometh light," not altogether inappropriate to a man who had just emerged from obscurity. Besides the porch there is a wing of the original building left, in the middle of which is a great gateway, and round the arch are inscribed further pithy sayings, which must have

made to this county. Of the Griffins little more need be said. The first of the race, the builder of the house, exhausts their claims upon our attention. Him indeed we are glad to think of, rejoicing in the light of his new prosperity, and ornamenting his gateway with pithy sentences. In these carved stones his memory will live, and not only there, but also on the cornice of Rothwell Market House, where his arms appear, along with those of other friends whom Sir Thomas Tresham delighted to honour.

We must now move away to Kirby. Of all the houses we have visited this is at once the most interesting as a building and the most devoid of history. We can hardly ever find it mentioned, and there are no legends about it which I am able to recount. We know that the first stone was laid in the year 1570, twelve years after the porch at Dingley. The parapet bears the date 1572. The doorways are ornamented

with the devices of the Stafford family, and on the parapet near to the date of 1572 is carved "Humfre Stafard," from which we learn that it was Sir Humphrey Stafford, of Blatherwick, who built the place. But he did not retain it long, for before the close of the century it had passed to Sir Christopher Hatton, the grave Lord Keeper, who "led the brawls," and in that family it has remained ever since. For more than two centuries it was the home of the Hattons, or the Finch-Hattons, and there they lived, hidden amid their thick massed trees, and so far removed from "the madding crowd's ignoble strife" that chroniclers appear to have forgotten the existence of one of the finest examples of Elizabethan architecture that the country can boast of. At the beginning of last century, indeed, its extreme seclusion led to the proposal to make Kirby an asylum for the Court, in case the threatened invasion of Napoleon actually took place; but the occasion never arose, and the house returned to its former obscurity, till its owners, having other and probably more convenient places to keep up, it was at length abandoned, and suffered to go to decay. The process of that decay is fitful but certain. Time flies, as Edward Griffin says on his house at Dingley, with a silent footfall, and the years go by without a sound here at Kirby too, except that now and again a great piece of masonry thunders down and sets the rooks in commotion; and the next time a visitor seeks a favourite nook it is gone. Enough remains to tell how noble a mansion it once was, the worthy work of two architects. For Sir Humphrey Stafford reared it with the help of John Thorpe, and the Hattons altered it with the help of Inigo Jones.

To many more delightful places you have been, are going, or might have gone had there been time enough. To Canons Ashby, to Castle Ashby, to Deene, to charming Apethorpe,

in Fayth," and a little way above, beneath the sundial, a fit timepiece for so calm a spot, is a sentence that breathes even a quieter and happier spirit than that of Edward Griffin's, and one which could scarcely have been more happily chosen for the place which it adorns, "*Tempora labuntur, tacitisque senescimus annis.*" Time flows by, and we grow old with the silent years.

ARCHITECTURAL ASSOCIATION EXCURSION.

WITH headquarters at Shrewsbury, the forty-third annual excursion of the Architectural Association has the following excellent programme:—Monday, August 12: Albright Hussey; Grinshill; Preston Brockhurst; Moreton Corbet; Battlefield Church. Tuesday, August 13: Wroxeter Church; Shipton Hall; Wilderhope Manor House; Broncoft Castle; Church Stretton. Wednesday, August 14: Madeley Court; Shifnal Church; Tong Church and Castle. Thursday, August 15: Stokesay Castle and Church; Ludlow; Ludford. Friday, August 16: Plaish Hall; Preen Manor and Church; Langley; Pitchford. Saturday, August 17: Shrewsbury.

Motor vehicles are to be used for travelling, which in this district will mean a sensible increase of the time available for sketching and study, and, given fine weather, a very enjoyable and instructive week is foreshadowed.

to King's Cliffe, once a Royal residence, where King John lost 4s. 10d. at play to the Earl of Salisbury; or else to Fotheringhay, whose tragic castle has sunk to one shapeless mass of stone; or to Barnwell, where the castle still stands, but without a shred of history; or, still keeping by the winding Nene, I might tell you of Dryden's birthplace or Titchmarsh, where his father enjoyed £40 a year; or I might take you into the beautiful park of Boughton, and guide you along the lofty avenues which traverse the country in all directions; always beautiful, whether in winter, when they stretch their purple brown masses across the landscape, or in spring, when the rooks gurggle in their lofty branches, or in summer, when they cast great lines of grateful shade. But time fails us for such excursions; only to one place will we go, one which we should pass through as we emerged from Boughton Park. There, just outside the park walls, is the little village green of Weekley, overshadowed by some of the trees which have strayed beyond the park, bounded on one side by the church, and in front of us by a long low almshouse or hospital, erected in the year 1611 by one of the Lords Montagu for the benefit of his ancient retainers. Nothing could be more peaceful than this scene, and as we gaze on the quaint front of the little building we can make out two inscriptions; one over the door, "What thou doest, do yt

and Rock Insurance Co., Ltd., who will occupy a large portion of them as their chief offices. The remainder will be divided up into offices of such area and so arranged as to suit in every respect the desires and convenience of tenants. On the north side of the building there is an open space, which will be maintained in perpetuity for the lighting and safety of the Public Record Office, to which it belongs. The main entrance to that part of the building to be known as "Old Serjeants' Inn Chambers," which is to be let off as offices, will be in Chancery Lane. The various floors will be reached by a wide, handsome staircase and by two quick-running lifts. A second staircase will connect the floors with an entrance in Clifford's Inn Passage, thus giving immediate access to Fleet Street. The building is of fireproof construction throughout, and is fitted with two hydraulic vacuum cleaner plants, by which all the offices, corridors and passages can be cleaned efficiently and at a minimum expense. Electric lighting and telephonic communication systems will be provided upon all floors, and at such points as will suit tenants. The building will be warmed throughout by the most modern and approved hot water system and by fireplaces. The premises have been erected from the designs and under the superintendence of Mr. Arthur Blomfield, M.A., F.R.I.B.A.

ROYAL ARCHÆOLOGICAL INSTITUTE.

(Continued from last week.)

THE summer meeting of the above Society opened at Northampton on Tuesday, July 23. The first day's visits (which were reported in our issue of last week) were confined to interesting churches in the town. For the remaining eight days a wider field was mapped out. The first visit was to Boughton House.

Wednesday, July 24.

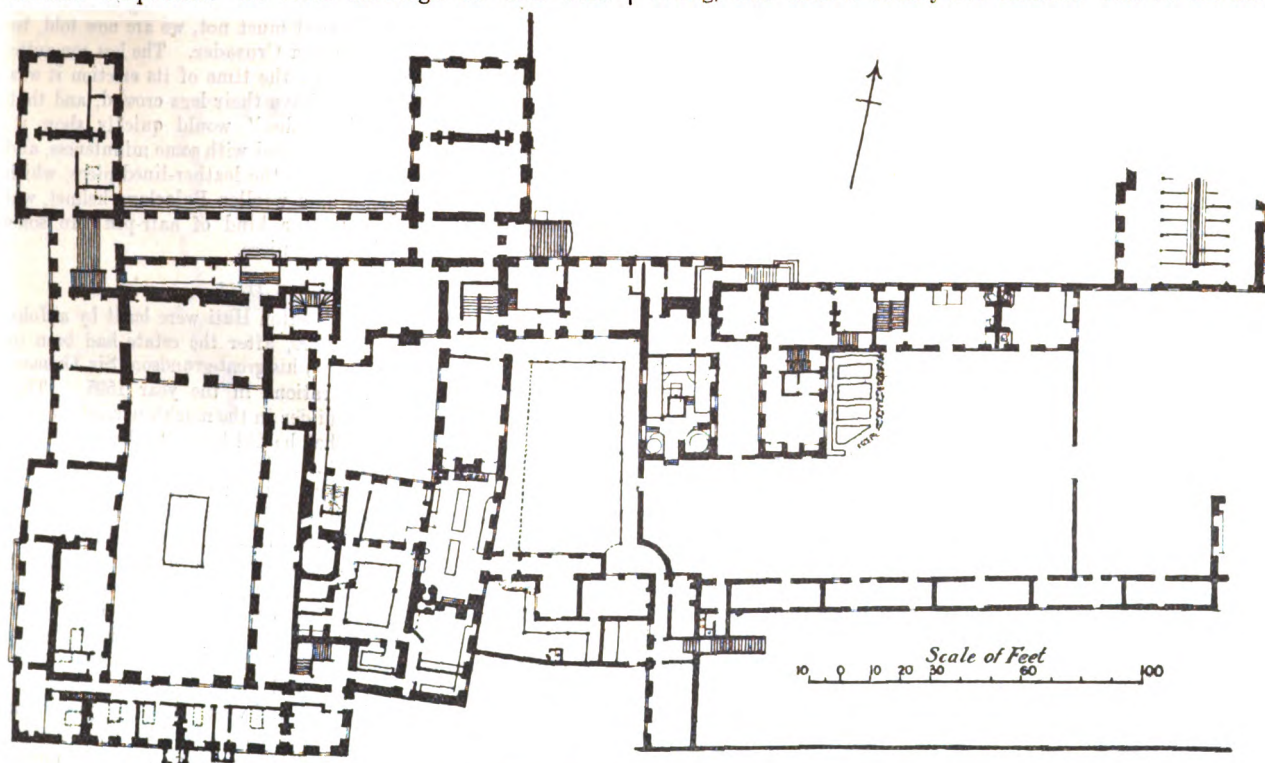

BOUGHTON HOUSE.

This house, said Mr. J. A. Gotch, F.S.A., F.R.I.B.A., in describing it to the party, is a good example of a home of one of the great nobles of the time of William and Mary. In 1528 Sir Edward Montagu, Lord Chief Justice, built himself a fine house at Boughton. But the present building may be said to date from Ralph Montagu, who came into the property in 1681. He proceeded to overlay and enlarge the old building work completely. The roof of the former great hall was one of great beauty and excellence; this the new owner did not destroy, but he had it covered with a new plaster ceiling, on which Cheron painted a large and elaborate composition. As Lord Montagu he had been

he planted avenues having a total length of sixty miles; some of them centred on the house, others pointed to neighbouring churches or spots of interest. Apparently the forest and avenues at St. Cloud were his inspiration. The grandeur of these gardens has long been dismantled; the great avenues alone remain and part of the canal system. Boughton House throws another sidelight on the increasing self-importance of the great nobles in its arrangement of its heraldry. As late as 1600 the aim of heraldry was as much decorative as historic; the family arms were principally regarded as excellent objects for ornamenting important panels, and if they ministered to family pride, so much the better. By 1708 the chief aim of the heraldry was to set forth the descent of the ducal family and its most important alliances.

The interior of this house offers an almost monotonous succession of great rooms, with their family portraits, pieces of tapestry, pictures, bureaux, inlaid tables, cabinets, and other works of art. One of the principal bedrooms has, however, two superb cartoons which are sometimes credited to Raphael. They stand out like giants among an army of pigmies—even though these be beautiful and rare ones.

Boughton had been reached by taking the train to Kettering, and then a twenty-five minutes' run in the motor

BOUGHTON HOUSE, FROM A PLAN MADE IN 1746.

Ambassador Extraordinary to France, and lived for a considerable time at Versailles. The influence of that building is strongly marked in some parts of the new work. This particularly applies to the north side, with its lofty windows and Mansard roofs; it is large in scale, sober and dignified in treatment. Indeed, it is so severe as to be thought dull by the casual visitor. This reproach is not brought against the interior. The rooms are big and stately; their walls have the great boldly moulded panels of the period; their ceilings are painted with the gay mythological subjects of Verrio and his school; the floors are filled with the tables, chairs, settees, cabinets, and bedsteads of the time. Portraits of the family hang on the panelling. Alas! for the vanity of vanities. Eventually these stately rooms were found to be cold, draughty, and inconveniently arranged—one leading, as a rule, out of another. Yet to the very fact that the house became less and less in favour we owe a debt. It was only by drastic alterations in the less notable rooms that Boughton has been fitted for occasional modern occupation. The splendour was not confined to the house; it pervaded the surroundings also. The first duke planted a double avenue as wide as the whole façade of the house. He laid out the huge gardens on a magnificent scale with parterres and wildernesses, long canals and jets d'eau. Statues gave point to the vistas. His successor, Duke John the Planter, continued the work in the gardens and outside; it is said

conveyances. An hour was allowed for summarily inspecting the vast mansion. Not many members had done more than rush through parts of it before the whistles sounded and a move had to be made to

GEDDINGTON CHURCH.

The principal interest of this building, said Mr. A. Hamilton Thompson, M.A., F.S.A., lay in the fact that incorporated in the walls is a very considerable amount of primitive Romanesque or Saxon work. The north and part of the south wall of the nave above the arcades are those of the pre-Conquest church; in the (originally) external face of the north wall is a row of triangular-headed recesses which formed the Saxon arcading. It may be assumed that the first church was aisleless and ended in a rectangular chancel. After the Conquest there may have been set up a central tower and transepts; the former was superseded by the present western tower at about the end of the fourteenth century, and the transepts were replaced by north and south aisles. When the construction of the north aisle was undertaken towards the end of the twelfth century the builders apparently commenced to open up the nave wall at the west end, as the final bay at the choir arch is only half a segment. At the end of the thirteenth century a south aisle and chantry were added. In the next century a good deal of embellishment was done, including the introduction

of somewhat elaborate sedilia and piscina. These improvements are recorded by a boldly-incised inscription round the foot of the inside walls of the chancel and the altar step in the south chapel; it is as follows: "Willelmus Glover de Geytintone capellanus fecit scabella eius are et pavementum istum cancellum ad honorem Dei et Beate Marie, qui obiit in fest Corporis Christi anno domini mcccclxix. cuius anime propicietur Deus Amen." The word "scabella" is usually assumed to mean an altar, but Mr. Thompson thought it more probably referred to the sedilia or possibly the foundation of the altar. The western tower with its spire has a feature very characteristic of churches in this part of the country—viz., angle buttresses of small projection. Noteworthy points in the interior are the late fourteenth-century panelled reredos, part of a thirteenth-century wooden screen between the chancel and the south chapel, and an elaborate arched screen bearing the date 1618 which was until recently across the entrance to the chancel, but which now is across the entrance to the south chantry. It is a florid though beautiful example of the intermixture of Gothic with Jacobean.

Mr. Hope made the very feasible suggestion that this latter screen was originally set up as the upper half of the nave chancel screen, the lower part being the thirteenth-century screen already mentioned. This idea was, however, later rather discounted on viewing a coloured drawing made before the last restoration, which showed that arch to be considerably lower than it is now and of a height quite insufficient for the two to be superimposed. Mr. Hope also made a protest about the interior walls having been "stripped of their skin." By some people, it may be replied, the removal of plaster and whitewash to a reasonable extent and the subsequent exposure of the bare bones of structure lends an additional interest.

ELEANOR CROSS, GEDDINGTON.

In the centre of the village and at the meeting of three streets is an elaborately carved cross mounted on seven steps. It has an hexagonal base, but the upper part is triangular and consequently of hard outline. It is curious that the rolls of Queen Eleanor's executors, which include minute details about many of the other crosses, should contain no mention of this one at Geddington. It is, as Mr. St. John Hope pointed out, totally different in scheme and design from the three still remaining. Instead of a massive structure it is simply a slender triangular column with three images of the Queen in the second storey, and ending in a shaft. The whole surface is covered with beautiful diaper work. Beyond doubt it belongs in date to about 1293-4. There was nothing except the figures to connect it with the Queen. The drapery of the latter is quite differently arranged to those on the Eleanor Cross at Hardingstone, just outside Northampton. While not contradicting the belief that the funeral procession in its erratic journey to London may have rested at Geddington, Mr. Hope remarked that the village was close to Hardingstone, where it undoubtedly stopped. A possible theory was that they used up some of the surplus stone from the other crosses. Whatever may be the explanation, the monument is in wonderful preservation despite its prominence.

The party then returned to Kettering, passing over *en route* just outside Geddington village a good fourteenth-century bridge with cut-waters on one side. After lunch at Kettering the cars were boarded once more. After half-an-hour's run a stop was made at

RUSHTON CHURCH.

When in the beginning of the thirteenth century the builders erected a tower at the west end of this church they did not bother to alter the west wall, but retained it exactly as it was, leaving a small deeply-splayed round window in position. The charming mediæval vestry is remarkable from the fact that it is on the south instead of the north side of the chancel, and that it has its own hipped roof; nearly half of the vestry is bricked up, and so might repay investigation. There is such an air of detachment about the building that it suggests some such use as a hermit's cell. But of such a use there are no records, so it is safer to accept the explanation that it was a fourteenth-century vestry. In the north chapel is a fine thirteenth-century effigy of a knight, and between the north chapel and the chancel is the alabaster altar-tomb of Sir Thomas Tresham (d. 1559). The latter figure is as to its drapery unique in this country. Sir Thomas (the grandfather of the builder) was the last Lord Prior in England of the Order of St. John of Jerusalem. Over his

plate armour and mail gussets he wears a long mantle with the cross flory on the breast. This cross flory is taken to be the badge of the Order before it was done away with some three or four hundred years ago. The Order was first suppressed by Henry VIII.; it was revived for a short period by Queen Mary with Sir Thomas as Lord Prior, and has been again revived within recent years. Mr. Hope, who described himself an humble squire of it, expressed regret that when the Order was last revived the badge adopted was the so-called Maltese Cross instead of the graceful cross flory. The monument was, he added, one of a large class in the Midlands of alabaster tombs, distinguished by their twisted angle-pilasters and the armorial shields. It would be, as Mr. Hope remarked, very interesting if anyone could find evidence as to the precise locality of the workshop from which they all came. The procedure of purchase must have been very similar to that in a monumental mason's shop or yard at the present day. The customer selected his kind of monument out of those in stock, and gave instructions as to the armorial bearings to be added and perhaps as to the effigy. This extremely prosaic method of business was prevalent in the thirteenth as well as in the sixteenth century, and was probably applied to the purchase of the Purbeck marble knight now lying in the north chapel. The fact that this warlike armoured figure (who is either drawing or sheathing his sword) has his legs crossed must not, we are now told, be taken to indicate that he was a Crusader. The less romantic explanation is offered that at the time of its erection it was the "thing" for effigies to have their legs crossed, and that consequently the "ready-mades" would quickly show it. The chain armour is here rendered with some minuteness, and among other things shows how the leather-lined piece, which fitted as close to the head as a woollen Balaclava helmet, was fastened at the left ear by a kind of hair-pin; in some cases it was laced to the lower piece.

RUSHTON HALL.

The earliest parts of Rushton Hall were built by a John Tresham about the year 1500, after the estate had been in the family for seventy years; his great-grandson, Sir Thomas, made additions and alterations in the year 1595. This Sir Thomas was a great builder in the neighbourhood, having erected, in addition to what he did here, the Market House at Rothwell, the Triangular Lodge at Rushton, and Lyveden New Building. Fuller says of him: "Hard to say whether greater his delight or skill in buildings, though more forward in beginning, than fortunate in finishing his fabricks." His building activities were doubtless much hindered by his frequent periods of imprisonment. His son and heir, Francis, was implicated in the Gunpowder Plot within two months of his succession, and the estates were confiscated. Rushton was bought in 1619 by Sir William Cokayne, who much enlarged the house and gave it its present appearance as viewed from the east and west. The Cokaynes became Viscounts Cullen and continued to live at Rushton until the beginning of the nineteenth century, when the property was sold. Since then it has passed through several hands and has suffered from fire. The interior has been entirely remodelled, and retains of the old work nothing except the ceiling over the staircase, a doorway, also on the stairs, a fine chimney-piece of Sir Thomas Tresham with his armorial bearings, and a plaster relief of the Crucifixion in the oratory. Of the exterior, the south front was built about the first quarter of last century, with very satisfactory results; the north or servants' side is also modern. The west and east fronts and the courtyard are mainly the original work, and are of most remarkable picturesqueness and dignity. The hall is now in the occupation of an American millionaire, and at the time of our visit was undergoing some works of internal alteration or decoration. It is to be sincerely hoped that his enthusiasm will not lead him into any ill-advised work. Every room appeared to be in "apple-pie" order last week.

RUSHTON LODGE.

The Triangular Lodge at the extreme corner of the grounds attached to Rushton House is not to be confounded with the freak buildings or "Follies" which dot the country. It is rather a demand in stone for liberty of conscience and a defiance of bigoted oppressors. Its builder, Sir Thomas Tresham, belonged to an old Catholic family, which had possessed the Rushton estate from about 1428. Sir Thomas was brought up as a Protestant, but three years after his knighthood at Kenilworth in 1577 he returned to the Old Religion. From that time until his death, twenty-five years

later, he was subjected to constant persecution, and is said to have paid each year £260 in fines as a "Popish recusant." The Triangular Lodge was finished just ten years before he died in 1605. It is designed in units of three. The ground plan is an equilateral triangle, of which each side measures 33 ft. 3 in. There are three storeys internally—viz., the cellar, ground floor, and the upper floor, and three windows in each storey; there are three gables on each face; the three Latin inscriptions consist of thirty-three letters; there is a central three-sided chimney shaft, whose sides are decorated with trefoils. The symbolism of it may be explained in Sir Thomas Tresham's own words, for a letter from him on the subject was found among other papers at Rushton about ninety years ago. "If it be demanded," he writes, "why I labour so much in the Trinity and Passion of Christ to depaint in this chamber, this is the principal instance thereof: That at my last being hither committed (i.e., at Wisbech Castle), and I usually having my servants here allowed me to read nightly an hour to me after supper, reading in the treatise of *Proof there is a God* there was upon a wainscot table at that instant three loud knocks as if it had been with an iron hammer given; to the great amazing of me and my two servants." The symbolism is continued in a great deal of the elaborate exterior carving;

models. It is sometimes tentatively ascribed to John Thorpe, who supplied the design for the same knight's "New building" at Lyveden. The structure was never finished, and was indeed as to its interior little more than a ruin when the district council restored it in 1897 under the guidance of Mr. J. A. Gotch, F.S.A., F.R.I.B.A., as a Jubilee memorial. The open ground floor was then converted into offices, and the upper into a free library. Mr. Gotch, in his book on Early Renaissance architecture, puts forward the interesting suggestion that in this building the first English attempt was made to improve on the awkward circular staircase built of stone or brick. Although circular on plan, it seems to have been an intermediate type between the stone corkscrew staircase and the straight flight of wooden stairs which succeeded it quite suddenly. In France a step forward had been already made by increasing the width and decreasing the depth of the risers and by introducing more frequent landings. At Rothwell a considerable width of step was intended, though no remains of it exist.

ROTHWELL CHURCH.

The interest of this church does not by any means depend upon the claim that it is the longest in Northamptonshire, nor even upon its vaulted thirteenth-century bone-croft,

[By permission of Messrs. B. T. Batsford.

RUSHTON HALL.—From Gotch and Talbot Brown's "Architecture of the Renaissance in England."

in some cases it is so involved as to baffle explanation. Over the entrance doorway, for instance, are the figures 5555. A complete diary is in existence, which gives the progress made on this singular work each week. The shields round the frieze show the arms of the Treshams and their intermarriages.

Rushton is about five miles distant from

ROTHWELL MARKET HOUSE.

If Sir Thomas Tresham allowed his fancy free rein in the design of the Triangular Lodge at Rushton, he had already given, in 1578, undeniable proof of his good taste a few miles away in the charming market house at Rothwell. The Latin inscription running round the outside suggests, however, something of an original mind. It narrates how the building was erected by him, and that "he sought nothing but the public good and the honour of his friends, and that he who wilfully mistakes the builder's intention is unworthy of so great a benefit." The honour of his friends is perpetuated by the numerous shields on the cornice and elsewhere of the principal Northamptonshire families at the time of its erection. In design it may be regarded as a most successful example of a country mason's endeavours to imitate classical

where are stacked the mortal remains of many hundreds of people. It has a rare and aristocratic beauty of its own. To the archaeologist it offers the fascination of a half-revealed mystery. As Mr. Hamilton Thompson remarked, its history is perhaps the most difficult to read in the stones of any of the twenty-odd churches on the Institute's programme. Like most of the others, its original plan has been altered almost out of recognition. The plan of the twelfth-century church was cruciform with, probably, a central tower; there are indications that the chancel had a south chapel. In the last years of that century and in the beginning of the thirteenth a general rebuilding was carried out. Some forty or fifty years later a tower was added to the west end, and the nave arcades were raised to about twice their former height (the old capitals and arches being retained), the aisles were widened, and the crossing heightened. Fifteenth-century work included "improvements" such as the stone vaulting of the tower, and the remodelling of the nave, clerestory storey, and east window. There are two brasses in the chancel. Mr. Thompson suggested that the bone hole may have been built as a charnel chapel. When this crypt was brought to light about 1700 it was found to be

filled with human bones. The local tradition that these belonged to the soldiers who fell at Naseby is rendered difficult of acceptance from the fact that that momentous battlefield is some miles away.

Thursday, July 25.

An early start was made in a special train which left Northampton at 9.5. Then, after a motor journey, the party at 10.30 reached

LIDDINGTON BEDE-HOUSE.

This is a building which could not fail to delight for its homely picturesqueness. An excellent idea of its front was given in our sketch on p. 50 last week. Mr. Hamilton Thompson described it as one of the most interesting mediæval houses in England, being practically untouched except for a little seventeenth-century modification. It belongs for the most part to the late fifteenth century. The Bishops of Lincoln established a manor house here in comparatively early times. St. Hugh of Lincoln gave the church of Liddington to be a prebend of that cathedral; and its bishops were very fond of living here in the Middle Ages. It had the additional recommendation of forming a half-way rest between the cathedral city and their favourite Oxfordshire residence. Another advantage was that it formed a very convenient centre where the clergy might come to be instituted. The house appears also to have been sometimes used by the prebendary of Liddington. Bishop Burghersh (1320-40) had licence in 1331 to enlarge and wall his park here, and in 1336 had licence to crenellate his house. The existing building appears to have been commenced by Bishop Russell (1480-95), and completed by Bishop Smith (1496-1514). In plan it follows the ordinary arrangement of a mediæval dwelling-house of the larger type. Its great hall and living-rooms were on the first floor, while below them were the offices and servants' quarters. At one end of the hall was the solar or private apartment with a narrow passage leading out of it to the bishop's bedroom; at the other were certain rooms which were probably used for the accommodation of the guests. The hall has a flat ceiling of no great height; possibly this is a later insertion of the sixteenth century. There is much old stained-glass in the windows. The building was converted into a bede-house for a warden, twelve poor men and two women by Thomas, first Earl of Exeter, who died in 1622.

Mr. Francis Bond, in describing this building as a most remarkable one, suggestively remarked that one can see churches by the hundred, but that there are only two or three places like Liddington Bede-house existing in this country. A most conspicuous feature of the hall ceiling is its wonderfully carved cove. This, as Mr. Bond pointed out, is an imitation in wood of the fan vaults which grew so much in favour during the fifteenth century after their first introduction in Gloucester Cathedral. This was put up by Bishop Smith, who in so doing probably lowered the height of the apartment very considerably. Mr. Bond put forward his suggestion that the hall may at one time have been carried to the full height of the building. Certainly the existing arch-braced roof in the attics deserved to be seen by some one more important than sleepy servants.

LIDDINGTON CHURCH.

The Bede-house stands close to the church, and to the south-west of it. The chancel, tower, and low spire are of the first half of the fourteenth century, the exact date being apparently between 1320 and 1340, when Bishop Burghersh carried out various works at the adjacent manor house of that time. As lord of the manor he would probably defray the expense of the tower, while the charges for the chancel would be defrayed by the prebendary. The east window contains that reticulated tracery which is common to much fourteenth-century work in Northamptonshire and Rutlandshire. The naves, aisles, and clerestory are very good fifteenth-century design. Objects of interest are the low side windows, some elaborately carved stone coffin-lids in the south aisle, a handsome rood screen, with traces of colour, and two fifteenth-century brasses (one with a later inscription). A curious feature of the chancel is the complete enclosure of the altar, which stands well away from the east wall, by Communion rails. These have remained in position since 1635, and are most interesting from an historical point of view as marking a phase of religious opinion which has left few structural traces behind it.

The presence of the low side window provoked interesting expressions of opinion as to its uses. Mr. Thompson remarked that both the theory of their being inserted to allow

of lepers in the churchyard participating in the services or of their being used as confessionals were alike untenable. The most feasible explanation to offer is that they were built for the purpose of allowing a bell being rung from within the chancel at the solemn moment of the Sanctus. Mr. St. John Hope strongly supported this theory of the sacring-bell as being the only common-sense explanation. The confessional theory could, he said, be put out of court by mentioning a few examples where such a use was a physical impossibility. There were instances, as at Kidwelly, where chapels with low side windows were placed on the first floor. At Lee Castle, Kent, there is an upstairs chapel with two low side windows which look over the moat. With regard to the leper theory, it seemed to be imagined by some people that lepers were allowed to roam at large over the country, and that they spent their time staring into churches. As a matter of fact, these unfortunates were strictly looked after, elaborate provision being made for their isolation in lazars or other places. Another suggestion sometimes offered was these windows were made for putting a lighted candle in for the purpose of scaring away the evil spirits which haunted the graveyard. Against that it might be remarked that many of them were obviously intended to be divided horizontally—the lower portion being fitted with a screen and the upper filled with glass. If, however, a candle was to be protected the whole window would be protected by glass. In view of objections such as these, Mr. Hope said that one was driven back on the theory that they were meant for the ringing of the sacring-bell.

After a fifty minutes' ride, the cars had to be left and a field path followed for a third of a mile, as an indirect approach to

KIRBY HALL.

Few architects or archaeologists can require an introduction to Kirby Hall, for it has perhaps been more written about of late years than almost any other building in this country. For over half-a-century it has been little more than a roofless shell. If report is true, it was the recklessness of an ancestor of Lord Winchelsea which brought about this shameful neglect. At one time there was a village and a church at Kirby; of these no traces exist. The Hall was apparently erected, said Mr. Gotch in describing it, entirely new—i.e., without including any existing house. It was built by Sir Humphrey Stafford of Blatherwycke. Why he came to Kirby has never been explained. The house owes its general character to John Thorpe, whose plans are still in existence in the Soane Museum. Although the court looks perfectly rectangular, it is really askew, and so it appears on Thorpe's plan. On that plan he recorded that the first stone was laid in 1570. This is borne out by the dates on the gables of 1572 and 1575. In the latter year Sir Humphrey Stafford died. His heirs sold the property to Sir Christopher Hatton, the Chancellor, who had commenced for himself a much larger Northamptonshire mansion at Holdenby. Of Holdenby there is practically nothing left but a few arches. For some years Sir Christopher never came near Kirby. In 1580 he writes in a letter that he had determined "to take my pilgrimage to Sir Ed. Bricknell's to view my other shrine, I mean Holdenbye, still unseen, until that holy saint may sit in it, to whom it is dedicated." The saint referred to is Queen Elizabeth. In the seventeenth century its then owner called in the help of Inigo Jones to modernise the house. Inigo Jones refaced the whole of the north front, added an attic storey, and inserted some new windows. Very little further work was carried out during the occupancy of succeeding owners. The last who lived here died in 1822. For the next ten years it was utilised as an agent's house. But, alas! since the middle of the 'thirties the story of the building has been one of stealthy decay until the undoing of the mischief is almost beyond private means. Perhaps some day this beautiful building will become a national possession. There are, however, from time to time rumours of its acquirement by some American millionaire or other. It is only a modern Cressus who could afford to have it all made worthily habitable.

Mr. J. A. Gotch, in his book on "Early Renaissance Architecture in England," points out that at Kirby Hall there is a determined attempt at a symmetrical treatment. The entrance gateway and the "screens" of the great hall are on axial lines running through the house and its court. The inner court is absolutely symmetrical, door corresponding with door, window with window; but the exterior façades have been somewhat left to take care of themselves instead of being carried out according to John Thorpe's orderly plan.

The south side of the court was occupied by the great hall, with at one end its winter parlour, kitchen department, larders, pastry and surveying place; at the other, or dais, end were the splendid family apartments and grand staircase. The long and narrow east and west wings were on the ground floor occupied by the lodgings arranged as a series

[By permission of Messrs. B. T. Batsford.
KIRBY HALL.—From Gotch and Talbot Brown's "Architecture of the Renaissance in England."

of intercommunicating groups of two or three rooms each. The first floor of the west wing served as the long gallery. On the north side is the first English instance of the open terrace or loggia, then fashionable in Italy. The detail is, says Mr. Gotch, unusually fresh and free, and has more variety than Elizabethan masons generally bestowed upon their work; the gable over the porch in the courtyard has no counterpart in England.

Luncheon was taken in the great hall, which still retains its carved ceiling and minstrels' gallery.

(To be continued.)

ROYAL SANITARY INSTITUTE CONGRESS AT YORK.*

In many of their works the respective provinces of the engineer and the architect are clearly defined and well separated; in many respects they are tangential and in some they overlap, or at least have their interests so interwoven that it becomes highly desirable that they should co-operate upon lines and in circumstances of mutual agreement and understanding. In affairs of the last class there falls one of the greatest

* Abstract of Presidential Address by J. Walker Smith, M.Inst.C.E., Chief Engineering Inspector, Local Government Board, Scotland, to the section of Engineering and Architecture.

importance in the work that arises from the operation of the Housing and Town Planning Act of 1909.

It must have been a source of satisfaction to all who have at heart the advancement of the science and art of city development that the British Government should have appointed a commission of engineers and architects to co-operate and collaborate in planning the city of Delhi. This is an example which I feel may, with very great profit and advantage, form a precedent for the future.

This work of town planning, of which we have such excellent examples in our country, and the absence of which, too, is exemplified in many deplorable instances, will need, and will receive, careful consideration from those of the engineering and architectural professions who feel drawn to specialise upon it.

There is already great public interest in the question of housing and town planning, and it is a little surprising that it is not even greater, for it should form common ground and a common interest for so many. The improvement of the housing conditions of the working classes, the abolition of slums, and precautionary measures, by means of town planning schemes, which will preclude the possibility of their recurrence, are objects that may well be common ground for all students of sociology, and for all who have at heart the uplifting of the race. Church and laity may join, and all shades of political opinion can unite in this cause: creeds and politics have no place in this work.

Better housing conditions, which will bring in its train a brighter home life and a better standard of life, is a step in the direction in which all desire to move who have at heart the improvement in the condition of mankind. This movement beneficially affects both the well-to-do and those less favoured by fortune. The well-to-do can perhaps efficiently house themselves, but town planning will affect them, as it will provide for a town development upon lines that make for improved sanitary conditions and amenity, and will induce the wealthy and prosperous citizen to reside in his town, to take his share in the assessments, in the management, charities, social work, and administration of his town. A community often suffers much from the exodus of its prosperous and capable citizens, of whose assistance and support it is thus in great measure bereft.

The thrifty and fairly paid workman in regular employment will appreciate better housing and a better standard of life. The thriftless, but well-paid (and there are many such), who does not appreciate the idea of improved housing and of a higher standard of life must be educated to appreciate and demand the better housing and better conditions of life for which he can already afford to pay.

Then follows the class, all too large, whom it is difficult to efficiently house. It includes those whose employment is casual, whose wages are small, whose physique is indifferent or bad, whose mental and moral condition leave much to be desired. This class may need careful selecting and segregation, as one solution will not be found for conditions which are so complex and so difficult to fully appreciate as those which govern this problem. It is possible that some may be trained and fitted for some other sphere of life, where better opportunities await them; others, again, on account of some mental or physical defect, may never be able to fight their own battle in life, and will need consideration upon special lines. But most of them will be required, and must remain where they are, in the centres of industry, and should therefore be provided with better housing conditions (and be educated to an appreciation of them), where they may lead a brighter life, and where they may bring up happier and healthier children. So far, and it is considerable, as engineers and architects are able to assist in the solution of this great and complex problem, they will use their skill in a good cause and earn the gratitude of all right thinking men.

We shall come face to face with the housing aspect of this problem in the set subject for discussion of our section, viz., "Modification of the Model By-laws from the rural point of view," which will be opened by Mr. Halsey Ricardo, whose knowledge of this subject is well known.

There is no doubt that the problem of rural housing is becoming particularly acute, and that all unnecessary restrictions must be removed, and all possible facilities rendered to enable efficient and sanitary housing conditions to be provided in our rural districts.

There is already power given under Section 44 of the Housing and Town Planning Act of 1909 to revoke unreasonable by-laws in connection with the erection of dwellings for the working classes. There is also given to local authorities under Section 55 (2) of the same Act somewhat drastic suspensory powers in connection with by-laws where

the local authority prepares or adopts a town-planning scheme. This power may be of very great use, but in order that it may be made available, it is necessary that a town-planning scheme be prepared and approved, whereof suspension of by-laws would form part, and would be shown to be in the circumstances, and having regard to the general scheme, reasonable and desirable.

In circumstances such as these, there is permitted the full consideration of special conditions and local circumstances which would be denied with by-laws of rigid application.

Some might think that suspensory powers might be granted without the necessity of preparing a town-planning scheme, whilst others would apprehend thereby confusion and resulting detriment to the public health and safety.

HOUSING AND TOWN-PLANNING PROGRESS.*

THE Housing, Town Planning, &c., Act, 1909, received the Royal assent on December 3, 1909, and has now been in force two and a half years; but not until the Local Government Board published their code of Regulations under the Act, on May 3, 1910, could any progress be made.

Since the promulgation of the Regulations under the Act in May, 1910, many conferences have been held, and many papers have been read before various learned societies and professional Associations; the present writer has been privileged to attend several of them, and the outstanding feature has been the remarkable difference in local circumstances. The area to be dealt with may be purely agricultural land worth £50 or less per acre, or it may be ripe for building purposes and worth £500 per acre before the roads are made, and from £800 to £1,250 per acre afterwards, or at any intervening price. The area may be one where the roads are already arranged or even partly constructed, the scheme being required to preserve the amenities of the district and prevent the erection of factories alongside already occupied villas; or it may be one where the roads are not constructed nor even set out, and the landowner unable to deal with the financial part of the work without outside assistance. The area may be one where the landowner is willing to have the number of houses limited to eight, or ten, or twelve per acre; or it may be one where the lower working-class is to be housed at a rental of 4s. or 5s. per week, and the number of houses per acre has to be thirty or forty to recoup the builder for his outlay and leave the margin required by the landlord to cover ground-rent and road-making. (It is certain that small houses must be allowed, otherwise two or three families will inevitably arrange to occupy one house, and the interior of the house will be a slum, whilst the exterior is everything that could be desired in a garden city.)

From the point of view of a local authority (which includes the departments of the medical officer of health and the surveyor, as well as that of the ratepayer), town planning is in theory the only thing; there is no alternative. But if, after laying down a scheme, the land is not taken by builders and covered with model houses the landowner is injured and houses are erected on other estates with less salubrious surroundings, all the labour expended in preparing the scheme being thrown away. From the point of view of the builder, the investor, and the landowner, the whole question is one of finance, and for any great progress to be made the question of finance must be carefully considered.

Where land is worth £50 per acre, a ground rent of less than one penny per yard per annum will cover both the value of the land and the cost of street-making; and at this there is no difficulty either in keeping the number of houses per acre down to ten or twelve, or in providing a decent sized piece of land even for the smallest type of house. Where land is worth more than £500 or more per acre, the ground rent will need to exceed 2d. per yard per annum to cover both the value of the land and the cost of street-making on model by-law lines. Therefore, to bring the estate within reach of the working man either a large number of houses per acre must be allowed, or there must be some relaxation of the model by-laws as to streets and buildings, a power which is specially provided by Section 55 in conjunction with the fourth schedule of the Act. At any intermediate price between £50 and £500 per acre the problem varies in ratio to the price plus the cost of street-making. It is for local authorities, when preparing town-planning schemes, to consider what relaxations they can consent to in return for healthier surroundings and amenities.

First, then, with regard to streets. The model by-laws generally prescribe that a street shall be 33 feet, 36 feet, 40 feet, or even 50 feet in width under certain conditions, that the streets shall be properly sewered, made, kerbed, channelled and flagged, the cost of which works out at from £2 to £3 per foot run according to width and nature of materials. It was suggested at the Town Planning Conference held in London on April 24 last to divide the streets into two classes, according to traffic: (a) to construct main roads from 70 to 100 feet in width, arranged and constructed to take all the traffic ever likely to come over them; and (b) to arrange the secondary roads so as to discourage or prohibit "through" traffic, to be only available for access to houses, and to be constructed accordingly very much narrower in width, less substantial in construction, and, possibly, not provided with either kerbs or channels, the footpaths being provided with only one row of flags instead of being flagged the whole of their width. In the discussion which follows this paper it is desired to elicit opinions on the foregoing suggestion, and as to what is the minimum construction that should be allowed; also the liabilities that may devolve upon future generations of ratepayers if any portions of the street (kerbs, channels, or footpaths) are not now constructed.

Secondly, with regard to buildings. The model by-laws with regard to buildings are not very onerous, except with regard to brickwork; and this is not felt so much in London as it is in the northern and midland counties, where bricks are so much better in quality than in the metropolis. The carrying of party walls through the roof is quite unnecessary for two-storeyed houses; a 9-inch wall might be allowed 30 feet or 32 feet high instead of only 25 feet; the 18-inch open channel between the slopstone pipe and the gully might be dispensed with; but with the exception of these there is not much to complain of, and it is difficult to see what relaxations can be allowed in the model code. It is certain that the erection of small houses as detached or semi-detached villas adds to the cost in many ways: there is an extra gable wall, with its foundations and slating; an extra footpath alongside the gable; an extra length of front and back and party fence, and other items. On this point it is desired also to elicit opinions as to what economies in building may be made, and what relaxation of by-laws should be allowed.

It may be pointed out that if there are no relaxations of by-laws, and if landlords will agree to lay out their estates on town-planning lines, providing wider streets for "through" traffic, and allocating a portion of the estate for park or recreation ground purposes (either by gift or sale to the local authority), there will be no need to lay the scheme before the Local Government Board, and many valuable months will be saved, in addition to an enormous amount of office work.

Finally, it must be remembered that the dreams of the idealist must be transmuted by the alchemy of common sense into something practical before they can serve as a basis for town planning and the laying out of garden cities.

After the reading of the paper the following discussion took place:—

Mr. F. W. Spurr (city engineer, York) said the subject touched on must concern every surveyor and municipal authority exercising the powers of the Town Planning Act, and for this reason the paper before the section must be very valuable. He felt quite sure that economies could be brought about in street construction, varying in amount with the particular form of construction adopted. In York the method of private street construction consisted of laying the footways with 3-inch Yorkshire flags, 12 by 8 inch kerb, and paved channels 14 inches wide, whilst the carriage way was constructed of either 9-inch stone pitching or 6-inch concrete, finished with 3-inch tar macadam the full width between channels. By adopting the following method of construction a saving of about 30 per cent. could be made, and he might say the Corporation agreed to this amended method of construction provided the width of the street was not less than 42 feet and the distance between the houses themselves 62 ft., with footways constructed of tar paving, composed of limestone chip-pings in place of 3-inch Yorkshire flags, 10 by 3 inch kerbs, in place of 12 by 8 inch, and channels 8 in. wide instead of 14 in. With regard to the carriage ways in residential streets, he did not advocate any alteration in the form of construction beyond reducing their width to about 16 feet, the remaining width being grassed and planted. With regard to economies in cottage construction, he did not think much could be done unless some other form of construction was adopted, but there could be no doubt that to build at the least possible cost cottages must be erected in blocks of not less than six. Some saving in cost could be effected where by-laws provided for

* Abstract of Paper read at the Royal Sanitary Institute Congress by Mr. H. Gilbert Whyatt, Assoc.M.Inst.C.E., Borough Engineer and Surveyor, Grimsby (Member).

carrying the party walls through the roof, a precaution which he thought was unnecessary; and something might also be saved by an alteration in the thickness of walls of two-storey cottages, as suggested by Mr. Whyatt.

Mr. Moulding (Exeter) said he agreed with Mr. Spurr's remarks. As the author had pointed out, all these things had to be considered in regard to the particular town one was engaged in. In Exeter they allowed, in certain streets where there was not much traffic, gravel footpaths, and they used granite because it was cheaper. In the carriage way itself they did not insist on 6 inches of concrete. He thought it would be a very good thing if they could get landlords to do that, so far as the future upkeep of the roads was concerned, but it was rather a big thing to ask an owner to do so. He considered that almost any uninhabited room attached to a house could be built in the way suggested by the author. In Exeter they had a new set of by-laws, and in the case of gable walls, &c., the extra thicknesses were modified.

Mr. Matthews (Bridlington) said he agreed with the author that local circumstances differed very considerably, and what would be very effectual in one district in regard to the method of town planning would, in another district, be quite impossible. His district was a residential one, and as he sat there he had been trying to imagine how greatly such a district differed from a place where the area for town planning was purely an industrial one. It was incumbent, therefore, on them, as surveyors, to make the best they could of the towns they lived in, and not be guided to too great an extent by what was being done in other places. The author said that it was certain that small houses must be allowed, or otherwise two or three families would arrange to occupy one house, and turn it into a slum. He did not agree with that. At Doncaster quite recently the Town Council presented a scheme of housing to the Local Government Board for approval, and at the inquiry it was elicited by the inspector that the class of people for whom the houses were intended had been paying 3s. or 3s. 6d. a week rent, whilst it was proposed to charge 5s. for the new houses. He said at once he could not recommend the Board to approve of that, and that they must draw out fresh plans showing houses to be occupied by two families, and each family to be charged 3s. a week. He did not think people would be less inclined to keep half a house in a sanitary condition than a whole house. As to the saving in the cost of road making, he certainly thought in any town planning scheme many of the roads over which there would not be a great deal of traffic should be of less width than was generally provided. In Bridlington a street had, according to the by-laws, to be 40 feet in width, but where there was not much traffic it might be 30 feet, which should be divided up into 16 feet roadway, 3 feet grass and turf on each side, and a 4-foot footpath each side. He did not agree with the suggestions made at the Manchester Conference that the road should be of very light construction, because very heavy traffic might occasionally come on them, such as furniture vans. He would have a good foundation for the road, but personally would prefer it paved with tar macadam.

Mr. Munce (Belfast) said they had not got the Town Planning Act in Ireland, although he took a great deal of interest in the subject, and generally he agreed with the remarks in the paper, although there was one thing that he thought was lost sight of. They seemed to forget altogether who were going to live in the houses and the wages the people would receive. Unless they thought of this many of the schemes which were full of fads would not succeed. In Ireland they dealt differently in the matter of land. They did not buy the land to build houses, but took it on leases, the duration of which varied from 999 years to 10,000. A man invested his money in the land, and made the streets and put in the sewers, and he then let the land at rents varying from 3s. to 4s. a foot frontage. The smallest houses were 12 feet frontage, but most were not less than 13 feet, so that the ground rents ran from 39s. to 52s. per year. These ground rents were then sold at from fourteen to twenty years' purchase. He believed that the best plan was to keep the centre of the town for commercial purposes, and take the people out in the country by tramway, even if they ran the tramways free. Grass plots by roads were all very well in theory, but in a few years they became a piece of clay. He thought a workman's house ought to be built for £100.

Mr. Cass (Farnham) asked why it was always considered that houses and cottages should face a road. It was this idea which added so enormously to the cost. He considered that they might so arrange them with pathways so that all the sunlight possible could be obtained. By insisting on road frontages it meant that they got houses backing on one

another. He was prepared to admit that the carriage way should be decently made and fairly strong, but one thing had impressed him very much, which was the enormous amount of waste in kerbs. He had known suburban districts where there was nothing but a furniture van in the way of traffic, with kerbs of 10 by 12 inches. If engineering meant anything it was the putting of the right thing in the right place, but in many districts of London the heaviest kerb was put down; and from the engineering and æsthetic point of view it was absurd. It was not only a great waste of money, but a great waste of appearance.

Mr. Whyatt, in reply, said they certainly could not build houses in England for £100, whatever might be done in Ireland. The smallest four-roomed house could not be built under £140, whereas if they had three upstairs rooms, which were certainly necessary, the lowest cost would be £165 or £170. Personally, he was inclined to think the grass strip was a mistake. He also agreed that it was not necessary that every cottage should face a street, but where they were building cottages in pairs or singles the cost of the gable walls and extra fencing would increase the capital cost. Although in theory there was no reason why two families occupying a house should not keep it well, yet in practice they found the tendency was to create an interior slum.

IN PRAISE OF SLATES.

By CLOUGH WILLIAMS-ELLIS.

(Continued from last week.)

WHEN a workman complains of his tools we don't confine our search for faults to his outfit; and anyone who, being forced to admit the structural superiority of a building material, is yet afraid to use it, is nothing of an architect and only half a man.

And the limitations of a material must be recognised no less than its capabilities. It must not be altogether your slave, it must, indeed, be to some extent your master. You must design with constant reference to its peculiar characteristics, you must design in terms of it, in its own tongue, so to say. It must be allowed to look over your shoulder, and in some sort guide your pencil. For example, one might suggest more attention being paid to that excellent, economical and typically "slatey" form of roof that bears the name of its introducer, Mansart, the great French architect, slate having been usually his medium.

Good materials *cannot* be wrong in themselves, but they *can* be, and frequently are, wrongly used.

It is not enough that slate is good; it must be rightly used, with sympathy and understanding.

With the good, honest, well-burnt, hand-made, sand-faced clay tile, the most ardent slatite should have no quarrel. It is a worthy competitor, and has its own special preserves in certain parts of rural England that should be kept sacred to it, even as Wales, Scotland, and the North, Ireland, most of the West, and most of the industrial centres, should cleave to natural slate.

There are, too, certain small and favoured districts such as the Cotswolds, parts of Northants, Sussex, and Yorkshire, wherein a man may get his own rough slates wellnigh from out his very cellar. They are to be had for the digging and splitting of them a short yard below his garden cabbages.

Let them rejoice in their good fortune and their beautiful slates of stone, and use them wherever and whenever they can.

Also, there are other British slates than Welsh, and some are of great beauty, like the Westmorland greens, and not a few are of right good quality too, and where a passably good local material is to be had at a reasonable cost, it is always well to make use of it, if only to help preserve such little "local colour" as the railways have left to us.

But, if you cannot delve for good slates hard-by your buildings, and have to introduce your roofing from afar, see to it that while you are about it you get the *best* procurable.

And this is *truth*, it simplifies specification to remember it. There are *no* imported foreign slates that can

compete for quality, appearance, or value with our own native products, be they blue, grey, or green.

They do, indeed, sometimes contrive to worm themselves on to British roofs, these slightly cheaper and utterly inferior foreigners (Yankees being classed as foreign). Anyone who has seen, as he may see, Portmadoc roofs unblemished after two centuries of Welsh weather, and roofs of foreign slates replaced by Welsh after an ailing life of but three years, will not need much persuading to support home industries so far as roofing is concerned.

In their own respective districts there is nothing more suitable than a real good hand-made tile or a good stone slate, nothing *better* save a Portmadoc slate, which one would hesitate to introduce.

Even then, Nature-made slates would be less out of countenance than would man-made tiles imported into Wales, insolently flaunting it within sight of the very hills from which the world's best roofs are gotten.

And yet anyone travelling by the North-Western Holyhead route may see for himself the red leprosy that has now infected many of its watering places, screaming roofs of machine-made tiles fittingly surmounting buildings of raw pressed bricks, often in association with the sham half-timbering and shoddy rough-cast that make one suspicious of a multitude of sins to be covered.

Why cool, grey, substantial looking Welsh towns of native stone and slate should suddenly fall to aping the flashy vulgarities of Greater London passeth all understanding.

What is Balham that we should desire it? Tooting, where is thy charm?

For the shiney-faced, bright-complexioned, machine-made, snare and delusion tiles, no words are too hard.

They are but bastard kindred of the good old hand-made sort, and they outnumber him a thousand to one as the spotted fever of suburbia's roofs doth testify.

They are the jobbing builder's delight. The laying of a roof of them is an investment that will bring him in a comfortable return in the way of repairing jobs for the rest of his natural life, for he may well outlive every tile of the original roof. So even the machine-made tile has its friends and supporters.

The best Welsh slates have been formed, consolidated, and matured during incalculable ages under incalculable pressure. They cleave as thin as the hand of man can split them along their natural planes of cleavage, but being non-absorbent, weather and frost are powerless to hurt them. They only split to the chisel.

Their poor competitor, the machine-made tile, has, at best, a few moments under puny hydraulic pressure, sufficient, however, to ensure disastrous lamination if nothing else.

Their pedigrees make interesting comparison. The slate of ancient pre-historic, pre-glacial ancestry, and the tile, new risen from the mud.

To saturate such a tile and then expose it to frost is a pretty experiment. It is one that seldom fails to come off. Large flakes of it do the same along its laminations, and this disintegration once begun, the end is not far to seek.

Every improvement in at any rate the texture and colour of building materials has been brought about by the active agitation of the "texturist" architects. Most of the best men are amongst them, and it is odd that they have not yet bullied the Welsh quarry-owners into the production of a slate more architecturally acceptable than their present staple products.

True, they cannot get the *colour* changed to their fancy. No power on earth will change the age-old colour of a good slate, but they can choose their quarry, and patronise those only that produce rock of a pleasing shade.

The anathematised purple-blue slate is no cheaper than the pleasant Portmadoc grey and smoke-blue slates which are readily obtainable in any quantities.

(To be concluded.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE designs submitted by the under-mentioned candidate for the Final examination under the various subjects of the Revised Testimonies of Study have been approved by the Board:—

Subject II. (b.)—Mr. F. Radcliff.

Subject III. (a.)—Mr. F. Radcliff.

Subject III. (a.)—Mr. E. H. Gibson.

Subject III. (a.)—Mr. Wm. Voelkel.

Subject III. (b.)—Mr. Geo. Crossley.

UNIVERSITY COLLEGE.

THE following awards have been made in the School of Architecture at University College:—The Donaldson Medal to Mr. Oliver Gaunt; the Carpenters' Company Travelling Studentship to Mr. S. Miller; the first prize in the Advanced Design Class to Mr. W. G. Whincop, and the second prize to Mr. H. S. Taylor; the prize for measurements and sketches also to Mr. H. S. Taylor.

In connection with the arrangements for the Carpenters' Company classes for next session, the classes in design will be continued on Mondays and Wednesdays, the visitors being Mr. Leonard Stokes and Mr. E. P. Warren. Mr. W. H. Ward will give a course of ten public lectures on the French Renaissance.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Allied Artists' Association.

SIR,—My attention has been called to the letter in your current issue from the Secretary of the Allied Artists' Association, respecting no notice having been accorded to architectural work at the London Salon.

Is it not, Sir, a fact that the Secretary answers his own complaint? For he says that the architectural work is nil. How, then, *could* it be noticed?

However, he is not quite right, for as a matter of fact I did observe some few buildings; but by a fatal twist in my education they did not seem to me to merit inclusion amongst the good, whilst at the same time they were above being pilloried amongst the bad.—Faithfully yours,

THE ART CRITIC.

The Further Road Improvement at the Marble Arch.

SIR,—The ill-founded rumours that shops were about to be erected at the Oxford Street end of Park Lane has entirely overshadowed the fact that an important road improvement is about to be carried out there through the generous manner in which the Grosvenor Estate has agreed to set back the new building line of the proposed block of buildings at that corner.

In the original plan for the Marble Arch improvement, published in 1905, the rounding-off of the north-east corner of Park Lane, and the demolishing of the unsightly stables there formed part of the scheme, not only on account of the traffic, but also on æsthetic grounds. Although for a time I had to withdraw that portion of the scheme on account of the existing leases, no opportunity has been missed during the past seven years in pressing home its importance.

Oxford Street will now be widened at this point by 16 feet and Park Lane at its north end by 10 feet, the junction of the two thoroughfares being rounded off by an additional 27 feet being thrown into the public thoroughfare, which is exactly the extra space at this point that was asked for in the original improvement scheme. North Row, leading out of Park Lane, will also be widened by several feet. The ground the Grosvenor Estate is thus giving to the public is no less than 5,139 square feet, and I am advised by competent authorities that its freehold value is well over £60,000.

Although everyone who has the slightest knowledge of town planning will regret that the interested public authorities have not availed themselves of this opportunity to acquire further land at this point in order to give symmetry to the Place at the Marble Arch, yet I am sure all Londoners will desire to express their gratitude to the Grosvenor Estate for this generous gift.—Obediently yours,

F. W. SPEAIGHT.

BUILDING IN LONDON.

BUILDING in London is beset with so many regulations and restrictions, contained in close upon fifty Acts of Parliament and numerous by-laws, that an architect needs to be deeply learned in the law if he is to steer his client and his client's building safely through the intricate navigation of compliance with legal requirements. Not only is it necessary that he should be acquainted with the provisions of the many Acts of Parliament and by-laws, he must also—a far more difficult matter—understand what they mean. There is scarcely a statutory enactment made in this country as to which people do not disagree in the interpretation—sometimes from inaccurate comprehension, sometimes from the obscurity or insufficiency of the wording of the statutes themselves. Hence the architect's knowledge of the statute law must be supplemented by an acquaintance with the case law that translates into practice the enactments of the legislature.

Nor is a knowledge of the law alone sufficient. The architect must, when building in London, be cognisant of the jurisdiction of the various authorities by whom the law is administered. There are the Home Secretary, the Corporation of the City of London, the London County Council, twenty-eight metropolitan boroughs, the Tribunal of Appeal under the London Building Acts, the Metropolitan Water Board, and numerous gas and electric lighting companies, all of whom make regulations, often differing in form and import, that affect buildings.

It is therefore a necessity for the architect who designs buildings to be erected in London to be able to readily inform himself as to the laws and by-laws that regulate the construction of the buildings which he has to design, and it is of the highest value for him to have them collected and collated in a single volume, such as that * recently produced by Mr. Horace Cubitt, to whom the thanks of all architects practising in London are due. The voluminous character of the statutes and by-laws made under them affecting building in London may be gathered from the fact that in a book of 800 pages no less than 335 are occupied by a transcript of the enactments which have some influence, direct or indirect, on the development of land and the erection of buildings.

The scheme of Mr. Cubitt's work is well conceived. After an explanation of the various authorities and the areas with which they deal and of the scope of the principal Acts of Parliament, by-laws and regulations, the various practical questions of street formation, drainage, air space, construction, &c., are dealt with, each in a separate chapter, in which, as far as possible, the whole of the requirements of the law are included and explained. All the provisions of the Acts, by-laws and regulations which have reference to building work in London are given in full in a separate portion of the volume, and by an excellent system of cross-reference the text of the enactments referred to in the explanatory chapters is readily found, whilst accompanying the said text are references to the explanations. Thus one can obtain a general view of the law affecting any particular section of building operations, and easily refer to the actual words of the enactment concerned for fuller elucidation or for assurance of the correctness of the explanation given by the author. The case-made law is included in the explanatory chapters, and at the end of each subject division a list of the principal law-cases therewith concerned is given.

The Acts of Parliament quoted and recited in full range from Michael Angelo Taylor's Act of 1817 to the London County Council (General Powers) Act of 1910, whilst the by-laws and regulations given include (a) those applying throughout the County of London and referring to new streets, common lodging-houses, seamen's lodging-houses, petroleum, applications under Building Acts, cubical extent, &c., places of public resort, cinematograph shows, means of escape, Metropolitan Water Board, Tribunal of Appeal; (b) those applying throughout the county, with the exception of the City of London and referring to sewers, submission of drainage plans, drainage, water closets, &c., removal of refuse, slaughter-houses, dairies, cowsheds, milk shops, &c., building materials, &c., plastering, &c.; (c) those applying in the City of London only, and referring to house drainage, &c., water closets, &c., demolition of buildings, hoards and scaffolds, vaults, pavement lights, &c.

Despite the number of enactments and the many principal cases that have been decided in the Courts, it still remains an unfortunate fact that sometimes all that can be said is that the law is in an uncertain state, and that the obtaining of legal opinion is advised if interests of importance are involved, and Mr. Cubitt does not hesitate to point out when he considers such to be the case, for, as he says, it is to the advantage of the private individual to know in what respects the provisions of the building law are open to question. For example, there is no definition either in the London Building Act or in any

* *Building in London. A Treatise on the Law and Practice affecting the Erection and Maintenance of Buildings in the Metropolis.* By HORACE CUBITT, A.R.I.B.A., F.A.S.I., certified competent to act as District Surveyor in London, formerly of the established staff (Building Act section) of the London County Council. With special chapters dealing respectively with the Cost of Building Work in and around London, by H. J. LEANING, F.S.I.; and the Valuation, Development and Rating of London Property, by SYDNEY A. SMITH, F.S.I. (London: Constable & Co., Ltd. 31s. 6d. net.).

case decided by the higher Courts that clearly and completely answers the question, What is a building? Nor is there, as Mr. Cubitt points out, a sufficiently clear distinction between a domestic building, a building of the warehouse class, and a public building, and it speaks well for the commonsense of architects and district surveyors that there appear to have been no cases contested in the Courts with regard to these definitions.

The chapter by Mr. Leaning on the cost of building work in London includes a very valuable schedule of the price per foot cube and per unit of accommodation for a large number of various classes of buildings, both within a twelve-mile radius from Charing Cross and without that radius, but still in what may be considered the London district.

Mr. Sydney Smith's chapters on London property, its development, values and rating, although necessarily restricted in space, contain many valuable pieces of information that should be borne in mind by owners and investors, actual or prospective, as well as by their architects.

An excellent and voluminous index completes what we have no hesitation in describing as one of the most useful books ever produced for the architect who designs buildings in London.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE have received a satisfactory number of contributions to the work of the club for the first month of the new year, and hope that all the authors will be able to send in regularly so that they may have a chance of obtaining the Studentship next July, as persistency and consistency count higher than occasional brilliancy. The drawings sent in this month are of a very even standard of excellence, and we have had no little difficulty in awarding the prizes for the July subject. We are pleased to find that there is still, despite the fashion of the day in design, so much earnest study of mediæval architecture which, alike for its educational value as for its interest, should never be entirely neglected by British students of architecture. Although he may never have the opportunity of designing or restoring a church, the present-day architect will find his ability to help maintain the position of England in domestic work largely increased by a study of mediæval buildings.

"Plato" has drawn the south porch of the church of St. Peter and St. Paul, North Curry, Somerset, a good example of Perpendicular work with an excellent fan vault.

Mr. C. H. Roberts has selected a good example of Early English work in the north porch of Christ Church Priory, Hants, an interesting instance of a two-storey porch, with a choir-room on the upper floor. Mr. Roberts draws well, but his work would be more complete with one or even two sections, particularly on account of the vaulted lower storey, whilst the mouldings were well worth full size studies.

"F. M." has also chosen an Early English work for measurement, but has given us a doorway only instead of a complete porch from the parish church of Kirkburton. Full size mouldings are wisely given with plan, elevation, and section, but the inner arch and its relation to the actual door should also have been studied. On the plan of arch mould the line of abacus and impost mould should always be indicated, and in this case the nook shaft also, so that the arch mould may be studied with reference to its support.

"Improver" likewise has measured an Early English building, the south porch of the church of the Holy Cross, Ryton, Durham, an interesting simple little building, with a few details of later date. It is a pity the side elevation given is not that with the window. Our remarks on "F. M.'s" moulding sections apply also to "Improver." In Gothic work particularly mouldings should never be viewed as distinct entities but as components of a design having a definite relation to each other.

"Alpha," like Mr. Roberts, has found a two-storey building for his subject in the south porch of the church of St. Andrew, Bishop Auckland, county Durham. This is Early English work, and has been carefully studied and drawn with plans, two sections, two elevations, and details of mouldings. The vaulting of the lower storey is also properly shown, with true elevations of the ribs.

Mr. Gordon Hemm takes the south porch of Gawsworth Church for his subject. This is Late Perpendicular work, the date given by the author being 1500 A.D. Two elevations and full-size mouldings only are given, without plan or section. The drawing suggests an incomplete rendering or omission of the label moulding over the main doorway, and a detail of the niche is imperatively necessary.

Mr. W. Doddington's subject is a porch at Lower Basildon parish church, Berkshire, a flint and stone building of late thirteenth century date, which has been very thoroughly and completely measured and drawn by Mr. Doddington.

Mr. Eric Wiseman has measured and drawn one of the few timber porches of mediæval times still remaining, that at South Benfleet, Essex. Mr. Wiseman has done his work thoroughly, but his draughtsmanship needs more practice, and a thicker line would be advisable for Gothic work.

"Amo" has chosen the same subject as "Improver," the south porch of the church of the Holy Cross, Ryton, Durham. He has omitted the detail of some of the later additions, but what he has shown is well drawn. A section should have been included.

We have decided to award prizes of twenty shillings to "Alpha" and seven shillings and sixpence each to Mr. C. H. Roberts, Mr. W. Doddington, and Mr. Eric Wiseman.

ROYAL ARCHÆOLOGICAL INSTITUTE.

(Continued from last week.)

THE final visit on Thursday, July 25, involved a leap back of some centuries, for the motor-cars conveyed the party from the late sixteenth-century Kirby Hall to eleventh-century

ROCKINGHAM CASTLE.

One of the many admirable accounts given in the Institute's programme is that dealing with the above historic building. We cannot do better than quote it in full: "The castle, founded by William the Conqueror, followed the ordinary mount-and-bailey plan of early Norman castles. The lower portion of the mount remains at the south-east angle of the site, which was probably walled in the course of the twelfth century. The greater part of the mediæval work now remaining, including the gatehouse, east wall, and the fabric of the great hall, belongs to the thirteenth century. Much rebuilding was done early in the reign of Edward I, when the hall, great chamber, and other domestic buildings took the place of earlier structures. The present house, however, is a large mansion, with the thirteenth-century hall as its nucleus, chiefly of two periods. The block east of the hall, containing the dining-room and kitchens, was built in 1585 during the tenure of the castle by Edward Watson. The western building, at right angles to the hall, consists of north and south wings, with its central portion on the probable site of the cellar and great chamber. This assumed its present form in 1660, but appears to be a restoration of Elizabethan work rather than a complete rebuilding. The long gallery is on the first floor of the south wing. The revetting of the south and west sides of the hill on which the castle stands appears to be Elizabethan, but the sites of two of the drum-towers of the mediæval curtain wall are known. The original plan of the castle is not very obvious at first sight, owing to the encroachment of the south wing upon the outer bailey. The great hall, however, was on the south side of the outer bailey, between it and the inner ward, the greater part of which is now filled by additions to the house of various dates, enclosing a courtyard on three sides."

Mr. Hope said he would like to impress on those present the undoubted fact that Rockingham Castle was a new one at the time of the Norman Conquest. There was a quite erroneous idea abroad that many of the castles then erected had really a pre-Conquest origin. Rockingham was one of the great ones thrown up by command of the Conqueror

on strategically commanding sites to quell the surrounding population. Many of them were on a very much larger scale originally than they are now, as in this instance. After some years the wooden defences were in part replaced by stone walls, and, as their original object had been achieved, there was no need to preserve the same size. What they did here was to construct a tower on the mound and to enclose the inner bailey.

The party were subsequently entertained to tea by invitation of the Rev. and Mrs. Wentworth Watson. This extremely interesting castle has been in the possession of the Watson family since 1579. It is fitting that one of the mottoes carved into the beams of the hall should be, "This house shall be preserved and never will decay, where the Almighty God is honored and served day by day."

Friday, July 26.

CANONS ASHBY HOUSE.

One of the many charms of this delightful house is its proximity to the high road, which runs under its walls on two sides. It is not one of those stately homes of England which stand haughty and exclusive amid a great park, or arrogantly perched on some height domineer over the surrounding country. At Canons Ashby the lord of the manor evidently thought of the comfort of his family and the happiness of his servants rather than of the envy of his neighbours. The house is of medium size, and stands to-day in many respects as to its plan as it was three hundred and fifty years or more ago, when a Dryden built the greater part of it. It has, we believe, remained in possession of the family ever since. The Drydens (or Dreydens, as the name

[By permission of Messrs. B. T. Batsford.

CANONS ASHBY.—From Gotch and Talbot Brown's "Architecture of the Renaissance in England."

was then written) were a Cumberland family, with some property in the neighbourhood. To this fact is generally ascribed the existence of the short tower, 50 feet high—an altogether unusual feature in the Midlands, but one which might well have been erected as a reminiscence of the pele towers seen in Northumberland and other Northern counties. John Dryden, a son or grandson of the founder, added the great hall and other portions. To him is also credited the formation of the courtyard, which, if unpretentious and innocent of frowning battlements or cunning loop-holes, would yet securely shelter a body of horse or many a stately equipage. With two-storeyed buildings on all four sides, access to it from the road can only be gained through one entrance. It is here that thoughts of defence and offence can occur, for the court is small and somewhat gloomy. The general plan of the house follows, it will be seen, the time-honoured arrangement which had its origin in those simple days when the owner was content with a hall to live in and a kitchen to cook in, and which gradually developed until, as here, there was a suite of family rooms at one end of the hall and a

corresponding servants' wing at the other. The most important subsequent alterations to this mid-sixteenth century house were those carried out by Sir Edward Dryden in 1708-10, though about a century before a fine coved plaster ceiling and a fireplace were inserted in the drawing-room. Seventy or eighty years ago the place narrowly escaped "restoration"—the greatest danger, perhaps, to which it has ever been exposed. Each of the many rooms on the two storeys has something of interest, not the least being the kitchen, servants' hall, and brew-house. The principal rooms have fine panelling, tapestry, open fireplaces, chimney-pieces, and are filled with some delightful furniture. The exterior of the house is delightful in colour, form, and texture; around it are beautiful flower beds, velvet lawns, and great cedars.

John Dryden, the poet and political writer, was a great-grandson of the Dryden who came from Cumberland. Edmund Spenser was an honoured visitor here; later Samuel Richardson frequently stayed in the house, and is said to have written a large part of "Sir Charles Grandison" at Canons Ashby. To archaeologists, not the least eminent occupant is the late Sir Henry Dryden, the fourth baronet, who died some years ago after achieving a considerable reputation as an antiquary, and whom his friends love to think of as a modern Sir Roger de Coverley.

CANONS ASHBY CHURCH.

The Order of Austin Canons or Augustinians first settled in England at Colchester about 1105. An enormous number of their houses was founded in the reign of Henry II., and to this period belong the four in Northamptonshire. The church at Canons Ashby as it now stands is merely the western portion of the nave of the priory church, which, as a rule, had naves of considerable length to accommodate their great congregations, with long choirs. Adjoining the nave at the north-west corner is a large tower dating from the early fourteenth century. Along the whole west front is an interesting arcade of two periods. It is probable that the church had at first, as was usual with the Black Canons, no aisles. When the time came to rebuild the nave, an aisle was erected on the north side between 1240 and 1250. The existing church is mostly of a later date; the east wall was inserted by Sir John Cope about 1540, to whom the priory had been granted two years before; the south wall was re-erected on original foundations in 1710, when the present roofs were also put up. There are numerous monuments to members of the Dryden family, beginning with a brass to the John Dryden who died in 1584.

BYFIELD CHURCH.

If for no other reason, a visit to this church would be repaid by the splendid old bench-ends. The interior has a very dignified effect, which is enhanced by the greenish colour of the local Horton stone. The present building represents the various fashions of the second half of the fourteenth century. The tower and spire are the latest portions; the latter, with its curious octagonal turrets at the angles, was not completed until early in the fifteenth century. In the chancel are three beautiful two-light windows of great height and slenderness. There is also a very interesting example of a low-side window. The large south porch resembles the tower somewhat. In it is displayed a notice to the effect that "All females are particularly requested not to enter this church in pattens."

After an interval for lunch at Hinton, a journey of nearly an hour's duration brought the party to

FAWSLEY DOWER HOUSE.

This is a mere shell, which was last occupied as a dower house in 1702, and has not been inhabited at all since the end of the eighteenth century. It was most likely built in the reign of Henry VIII. It faces south, and is for the most part of brick with vitrified diapers in the walling, stone being chiefly reserved for the windows and dressings throughout. As Messrs. Garner and Stratton say: "The details are very similar to those in the west wing at the manor house, and its excellent cut-brick chimneys show how widespread was the delight in making this prominent feature beautiful as well as useful." They are the only examples of elaborately cut-brick twisted chimney stacks in this stone county. The rooms must have been small and low. The accompanying plan shows the arrangement as far as it can now be made out from the existing outer walls. It seems a pity that something more efficacious than encircling it with barbed wire cannot be done to preserve this building from further decay.

FAWSLEY CHURCH.

Situated close to the great mansion and cut off from the world by a wide park, this small thirteenth century church

seems to be an appendage of Fawsley Manor House. Its interior bears out that impression from the prevalence of Knightley monuments. A lot of old woodwork has been used up in the present pews; in the windows is a large amount of heraldic and German medallion glass—the latter

SCALE OF FEET 0 10 20

[By permission of Messrs. B. T. Bateford.]

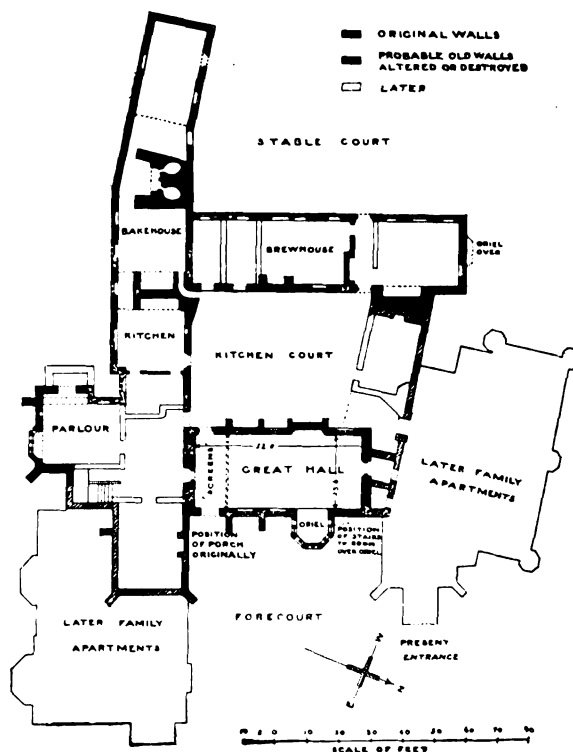

FAWSLEY DOWER HOUSE.—From Garner and Stratton's "Domestic Architecture of England during the Tudor Period."

dealing with sacred subjects. The church would be worth a visit if it sheltered no other monument than the table tomb of Richard Knightley (d. 1533) and his wife, Joan Skenardon. Its alabaster figures retain much of the original colouring and are therefore of exceptional interest. There are several small alabaster figures of children in the sides. Mr. St. John Hope, in speaking of it, said that if the monument were in France a cast would have been made of it by the Government and placed in the Trocadero Museum; whereas in England no one bothered about works of art which their forefathers produced. The monument was, he continued, worthy of the closest examination by reason of its extraordinary detail. As alabaster was soft when quarried and only hardened under exposure it was possible for the carver to obtain the greatest minuteness. There was, he added, a very similar tomb in St. George's Chapel, Windsor. Besides this masterpiece of English sculpture, there are brasses and many other family monuments in the church of various dates.

FAWSLEY MANOR HOUSE.

As will be seen from the accompanying plan, which was made by Sir Henry Dryden in 1857, there have been very considerable additions to this building. As they lack artistic merit they have the effect of making a disappointing first impression, which is only removed when the great hall is entered. The hall itself had its screens at the south end; the oriel window, instead of lighting the high table according to custom, was placed in the east wall and nearly opposite a very handsome fireplace. Messrs. Garner and Stratton, in the first volume of their work "Domestic Architecture of England during the Tudor Period," give a detailed account of this interesting stone-built house. There is in the district, as they point out, surprisingly little domestic work of the fifteenth century to suggest the wonderful inheritance from the church builders of the two preceding centuries. From their admirable account we take the following:—"Fawsley is built of a warm-coloured local brown stone with white stone dressings, and while it perpetuates all the irregularities of an early court-yard house it at the same time marks an advance of some significance. No thought of protection from attack seems to have influenced its plan, all the rooms look out fearlessly through wide and lofty windows into the stately park, and the great hall, instead of being sheltered from intrusion by being accessible only through a gatehouse and across a courtyard, as in most houses of its type, stands directly in the front with the principal entrance freely exposed to the outer world. This foreshadows an important development, and one that Elizabethan builders were not slow to appreciate. The earliest parts of the house as it now stands are in the kitchen wing. . . . The great hall seems to have been completed by Sir Edmund Knightley between the years 1537 and 1542. Though it has been altered in many ways, and the fine bog oak ceiling spoilt with paint and plaster, it is still a noble example of the hall of the sixteenth century, when it was ceasing to be the common dining-room of the household, but as yet had not taken its place in a symmetrically disposed plan." Fawsley is therefore interesting to the architect as marking a step towards the development of the present-day house plan. To the genealogist it should

be a paradise. Conspicuous and alone on the south wall of the great hall is the family achievement which bears no less than 334 quarterings. When the Richard Knightley bought Fawsley in 1415 he did not come, like so many others, as an ambitious *nouveau riche* eager to lay the foundations of a pedigree. The house of Knightley is one of the

[By permission of Messrs. B. T. Bateford.]

FAWSLEY HOUSE.—From Garner and Stratton's "Domestic Architecture of England during the Tudor Period."

very few in England which can prove an undoubted descent from an ancestor recorded in Domesday—Rainald, lord of Knightley, in Staffordshire, whose son William assumed the local name. The Knightleys had a remarkable aptitude for marrying heiresses, whose arms were duly impaled on the family escutcheon. Yet another kind of interest is attached to Fawsley House. Above the oriel window is a small chamber where the "Epitome" (the second of the Martin Marprelate pamphlets in support of the Puritans) is believed to have been printed. Sir Richard Knightley, when examined by the Star Chamber, admitted that the tract was printed at his house.

Lady Knightley of Fawsley received the members, and, after conducting them over the house, entertained the party to tea in the great hall.

Saturday, July 27.

The fifth day of the Summer Meeting was noteworthy by reason of the fact that all the visits were exclusively to churches or their attendant buildings. The first place was Stanwick.

STANWICK CHURCH.

In a county containing as many imposing churches as Northamptonshire, this church might not attract the passer-by if it were not for the thirteenth-century tower and spire at the west end. Again, these might, in a county of good spires, win little more than a glance if it were not for their outline on plan. They are octagonal from the level of the nave roof. The long slender spire is more decorative in character, and apparently somewhat later in date than the tower. The belfry stage has an arcade of round-headed arches, of which those facing the cardinal points are pierced with coupled lancets, and the other four faces have only the heads. There is a chamber over the south porch. The interior of the church shows the customary variety of periods. The pulpit was the gift of John Dolben, Bishop of Rochester, whose father had been rector at Stanwick from 1623 to 1631.

RAUNDS CHURCH.

This church is considered one of the most striking and important in the county. Its chief feature is the tower and spire, rising to a height of 150 feet, at the west end, which gains additional prominence from the fact of its being approached up sloping ground. Raunds is generally considered

to have the finest steeple in England of its period—the first half of the thirteenth century. The interior presents a great many problems for elucidation. Mr. Hamilton Thompson, in explaining the building, said it was, at any rate, clear that in the first instance there was an aisleless church. Between 1200-50 a great deal of work was carried out—possibly the tower was built somewhat westward of the Norman nave. The chancel is particularly puzzling. The frescoes, or rather the scanty remains of them, are interesting; they were discovered in 1876 under the whitewash during the restoration of the church by Sir Gilbert Scott. The one considered the most remarkable is that on the north wall illustrating the legend. "The three kings living and the three kings dead." Another shows St. Christopher, a third is a symbolic representation of the Seven Deadly Sins. There was also a series of pictures illustrating the history of St. Catherine.

HIGHAM FERRERS.

There is here a fine group of buildings within the churchyard wall, comprising a grammar school founded by Archbishop Chicheley in 1422, a Bede House or hospital, also founded by him, and a noble church, which was likewise much indebted to this prelate, who proved finely "the affection he retained for the place of his birth." Finally, we may mention the ruined cross and the vicarage. A threshold worthy of the finest parish church in the land is that under the tower. Its large exterior enclosing arch forming a shallow porch is a fairly frequent feature in the locality, as at Oundle, Rushden, and Raunds. It shelters a pair of doorways with low segmental heads, and in the tympanum above are ten circular carved panels dealing with the life of Christ. On entering through this west door the visitor cannot fail to be struck by the length and breadth of the church. It may be said to have two naves and two aisles. No positive explanation is forthcoming as to why two naves of practically equal length and breadth came to be erected. On plan the body of the church is square, while the two chancels make a smaller square. The church is mainly of the late thirteenth and early fourteenth centuries. The south or ritual chancel and choir contain excellent stall and screen work, which were given by Chicheley. Between the chancels is an elaborate early fourteenth-century canopied table tomb, with considerable remains of colour and interesting heraldry. There is another screen between the north chancel and nave; in this chancel is a brass of Chicheley's father, and its eastern portion is screened off, as at Rushden, by a partition wall to serve as a vestry.

The advowson of the church belonged to the family of Ferrers, Earls of Derby, whose castle stood on the north side of the church until the attainder of Robert Ferrers in 1266. It was then granted with the manor to Edmund, Earl of Lancaster, second son of Henry III. His second son granted the church to the new College of the Annunciation of Our Lady in the Newarke, at Leicester, to whom it was appropriated in 1357-58. The vicarage remained in the gift of Newarke College until the suppression of that foundation under the Chantry Act of 1547. In 1422 Archbishop Chicheley obtained licence to found in the church a college of eight chaplains, one of them to be master, another to be grammar-master, and a third song-master, four clerks, and six choristers. Its chief endowment consisted of the possessions of the suppressed alien priory of Mersea in Essex. It was surrendered to Henry VIII. in July 1542, before the passing of the first Chantry Act. The common house of the college was some distance north-west of the church; considerable remains of its gateway exist on the west side of the main street of the town. The school and almshouse, or hospital, which remain in the churchyard are in arrangement exactly parallel to that at Ewelme, in Oxfordshire.

After an interval for lunch at Hinton, a journey of nearly an hour's duration brought the party to

RUSHDEN CHURCH.

The ground plan of this church is curious, and it almost appears as if the thirteenth century builders might have had to deal with a short but broad site. Unlike most of the churches in the locality, there are here both aisles and transepts. The north and south chapels of the chancel are a late fifteenth century rebuilding and enlargement of earlier chapels; their side walls range parallel with those of the nave. The transepts are short and wide. The width of the aisles may have rendered necessary in the fifteenth century the introduction of the present elaborately pierced strainer arch between the nave and the crossing of the transeptal chapels. There is an arch of precisely similar

character at Finedon church, and also a second in the same county. Across the entrance to the south chapel or chancel aisle is a beautiful Perpendicular arch with vigorously carved angels supporting its exterior square label. An inscription on the soffit records its construction by "hue bochar and Julian his wyf." Other points noticed were the fifteenth century screen work across the entrances to the three chancels and the transepts; the roof; a stone reredos; the imposing east window; the pulpit, and the font. The tower and spire are of unusual beauty; it has a shallow recessed porch in front of the west door; indeed, this fifteenth century addition is generally considered to be the finest and most elegant of all Northamptonshire towers and spires.

Mr. Hope drew attention to the remains of ancient glazing in the windows, including an unusual treatment of the Tree of Jesse. Mr. Aymer Vallance pointed out that the tracery in the church was typical of this part of the country, where windows of late fifteenth century date were not of pure Perpendicular design as the ogee formed the basis of the ornament.

The rector claimed with pardonable and praiseworthy pride that the Institute would not come across a church more beautiful in its architectural detail than their famous one of Rushden. In the locality they called it the Queen of Northamptonshire churches—the king being that at Higham Ferrers.

In the evening a paper was read at the Grand Hotel by Sir W. Ryland D. Adkins, K.C., M.P., on "The Story of Northamptonshire."

Monday, July 29.

The second half of the summer meeting opened with a railway journey to Thrapston, and then a ride in vehicles to

LOWICK CHURCH.

This church is most remarkable for its monuments. The nave and aisles were probably erected by Sir Henry Greene, who obtained possession of the manor and the advowson in 1369. Sir Henry was a favourite of Richard II., and was executed at Bristol in 1399. He was succeeded in his estates and in his church rebuilding by his son Ralph Greene, whose splendid monument is in the chancel. The most remarkable structural feature of the church is the series of windows in the north aisle. They are of four lights divided by a battlemented transom. The upper divisions are filled with fourteenth century stained glass taken from a Jesse Tree. The beautiful western tower has a large octagonal lantern, after the fashion of some other churches in the neighbourhood. There are a series of tombs of the lords of Drayton, including the alabaster monuments of Ralph Greene and of Edward Stafford, Earl of Wiltshire, and a marble tomb, with brasses, of Henry Greene.

Mr. W. H. St. John Hope, in describing the monuments, said that the special interest of the alabaster tomb of Ralph Greene and his wife lies in the fact that it is one of the two whose history is accurately known. The text of the contract in French for the making of the entire monument has been preserved. It is dated February 14, Henry V. (1418-19), between Katharine, who was the wife of Ralph Greene, esquire, William Aldwyncle and William Marshall, clerks, on the one part, and Thomas Prentys and Robert Sutton, of Chellaston, in the county of Derby, "kervers," on the other part, "witnessing that the said carvers have covenanted and agreed to make and carve well, honestly and profitably, a tomb of stone called alabaster, good, fine and pure, containing in length 9 feet and in breadth 4 feet 2 (inches), upon which tomb shall be made two images of alabaster, the one a counterfeit of an esquire armed at all points, containing in length 7 feet, with a helm under his head and a bear at his feet; and the other image shall be the counterfeit of a lady lying in her open surcoat with two angels holding a pillow under her head, and two little dogs at her feet, the one of the said images holding the other by the hand, with two tabernacles called gablettes at their heads, which tomb shall contain at the sides the ledgerment three feet, on which sides shall be images of angels with tabernacles bearing shields according to the device of the said Katharine, William, and William. And also the said carvers shall make an arch of alabaster above all the said tomb in length and breadth, with pendants and knots and a crest of faytes and other works pertaining to such a tomb, the which images, tomb, and arch shall be proportioned, gilded, painted, and arrayed with colours well and sufficiently in the pure, honest, and profitable manner that pertains to such work. For doing and performing which works in manner aforesaid the said Katharine, William and William shall pay or cause to be paid to the said

Thomas and Robert, or either of them £40 sterling." The conclusion Mr. St. John Hope arrived at was that from their similarity all these series of knightly effigies in orles (or roll of rich embroidery worn round the bascinet), dating from the close of the fourteenth and the beginning of the fifteenth century, were the work of the Chellaston. There are also other groups of alabaster tombs that clearly emanated from a common centre, probably Chellaston.

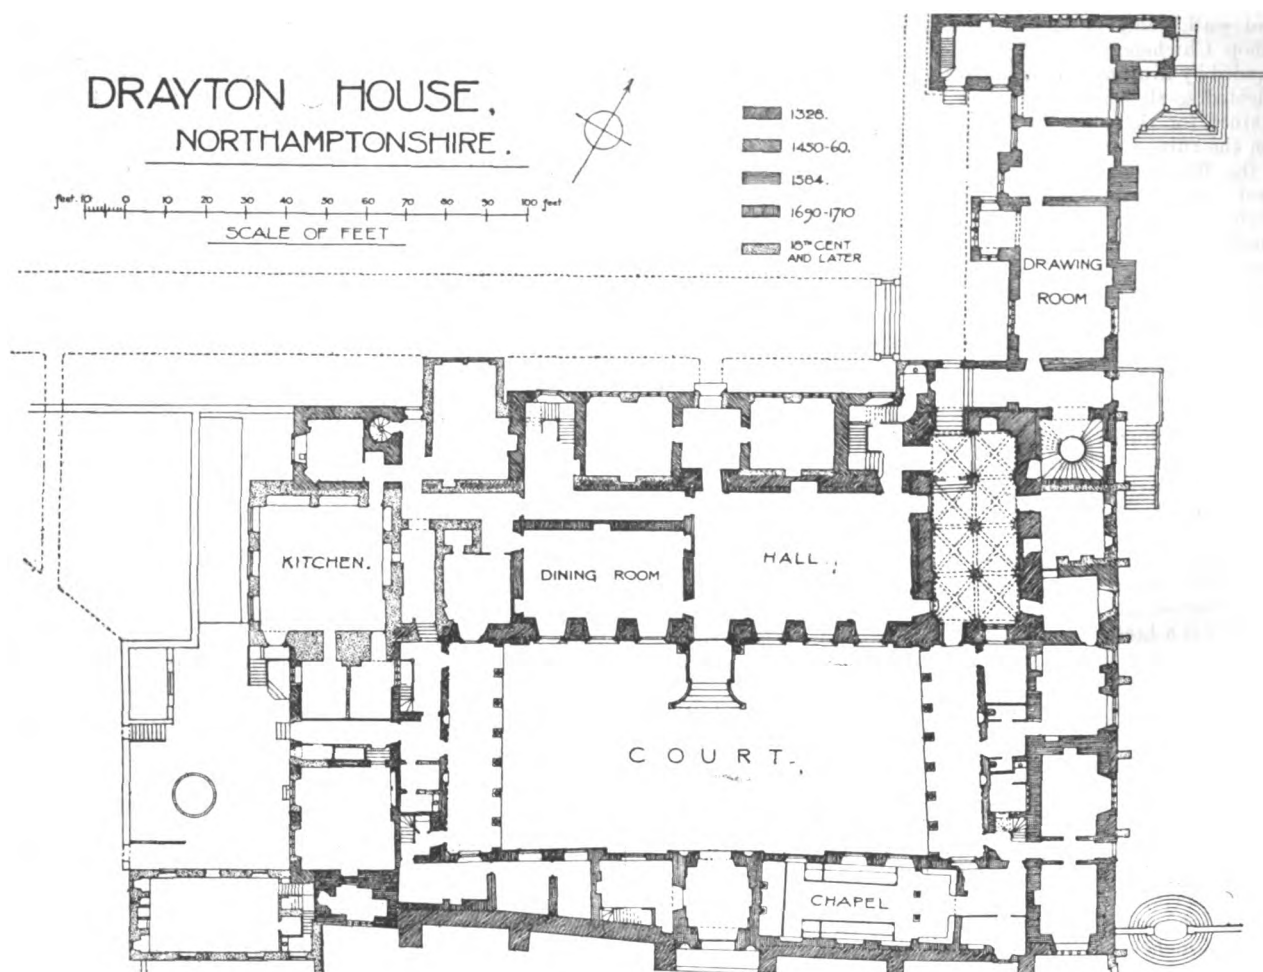

In speaking of alabaster monuments generally, Mr. Hope gave an interesting account of a French purchase of English alabaster in 1414. Two documents were brought to light in France a few years ago, and brought to the notice of English archaeologists by Mr. John Bilson, which chronicled a voyage to England undertaken by Alexandre de Berneval, mason, for that purpose. This Alexandre was one of the most prominent architect-masons of Rouen in the first half of the fifteenth century. In 1414 he was commissioned by the abbot of Fecamp to go to England to purchase the necessary alabaster for certain work. The architect and three com-

Alexandre and his companions should buy; while he was to be paid for the freight at an agreed rate.

After inspecting the church a move was made to

DRAYTON HOUSE.

The early manor house probably consisted of a hall, with cellar and great chamber above at one end, and kitchen offices at the other, and was apparently entered through a porch on the north side, opposite the present entrance. The cellar, built about 1270, and vaulted in two alleys from a central row of columns, still remains with very slight alterations; the hall has been much transformed, but portions of the old walls are left, and the mediæval roof is preserved above the present ceiling. In 1328 Simon de Drayton had licence to crenellate the house; the outer wall of the present entrance courtyard may be referred to this date. The porch of the hall was rebuilt by Henry Greene before his death in 1467-68. In 1584 the second Lord Mordaunt of Turvey added the north-east wing, with the long gallery on the

J. A. GORCH, F.S.A., mens. et delt.

panions sailed to Newcastle, where they stayed eight days at the expense of the English ship-master. They left Newcastle on St. Christopher's Day (July 25), and arrived the fourth day after at Nottingham. "And then the said Englishman (i.e. the ship-master) took them to a village called Chellaston, where the alabaster was, and found there the merchant who sold it, called Master Thomas Prentis, with whom the said Englishman made a bargain to deliver to him certain pieces of alabaster at a certain price, by an agreement between them two in the presence of the afore-said persons, by whom the said Prentis should receive immediately forty golden crowns, undertaking to deliver the said stone at the port of Hull in England. And the terms were made in the town of Nottingham in England between these English merchants. And afterwards, forthwith and immediately, the said English merchant took the said Master Alexandre and those in his company to the port of Vicerney (Winchelsea?) in England, and caused them to cross over thence to Dieppe. And everything was done at the expense of the said Walter, the Englishman, from the time that they left Harfleur to their return to Dieppe, together with four horses bought by the said Englishman." It should be mentioned that before they set out on their six weeks' journey the abbot and convent advanced the ship-master two hundred golden crowns to be expended in such merchandise as

third floor, and a Gothic-vaulted cellar in the basement. The towers at either end of the north front were perhaps built at the same time, and two-storeyed buildings were erected against the north wall of the house on either side of the porch. The wooden dormer windows of these buildings and the stone cupolas of the towers appear to be additions of the middle of the seventeenth century. In the latter part of that century Henry Mordaunt, second Earl of Peterborough, laid out the gardens, building the small banqueting-houses in the east garden, and decorating its walks and parapets with much handsome leadwork. He probably shifted the main entrance to the south side of the house; the outer gateway of the entrance courtyard is certainly his work. After the marriage of his daughter, the Duchess of Norfolk, with Sir John Germain, in 1701, the south front of the house was transformed by the erection of the stately entrance façade, the general features and details of which are very unlike any contemporary English work. The architect's name is unknown. At the same time the great chamber was remodelled, sash windows were freely introduced, and three staircases were made, one of which, at the south end of the Elizabethan wing, is a fine example of a spiral staircase of geometrical construction. The grand staircase at the north-east end of the hall has painted walls and ceiling, and an iron rail which, with most of the iron-

work of the house and garden, may have been designed by Tijou. A new stair was made from the Elizabethan wing to the east garden, and the approaches to the house were provided with iron gates of great beauty. Sir John Germain's second wife, before her death in 1769, added the east and west colonnades of the courtyard, and built a chapel against its south wall. The last important work in the latter part of the eighteenth century was the redecoration of the dining-room (on the probable site of the early kitchen) and drawing-room. The delicate coloured plaster-work of the dining-room is in the manner of the Adam Brothers, but the name of the artist has not been kept on record. Much discriminating restoration has been done in recent years. The whole house is a splendid monument of English domestic architecture, and contains a vast amount of furniture, china, &c., which has its own special interest. There is a fine plaster ceiling in the great chamber or king's chamber, and the Oriental decoration of the Duchess of Norfolk's boudoir, which adjoins the long gallery, is also noteworthy.

Drayton and Woodford are a good many miles apart, so a halt was made en route for lunch at Thrapston.

WOODFORD CHURCH.

Woodford Church is as long and narrow as Rushden is short and broad. There are many curious constructional features about it. The nave and north aisle are strengthened by cross arches at the fourth bay from the tower; across the south aisle there are three transverse arches; there is a curious extension eastwards of the very beautiful south porch, which is sometimes explained as being part of a transeptal chapel. Just westward of the present chancel is an arched monument with a wooden effigy of a member of the Trailly family (c. 1300), who were sometimes lords of the manor and patrons of the church. A small recess cut into one of the nave pillars contains something wrapped in cloth, which is believed to be a heart—probably that of some Trailly who died in the Holy Land.

The last visit on Monday's programme was to

LETHLINGBOROUGH CHURCH.

By far the most notable feature here is the west tower, which is a campanile connected with the church by a double porch. It forms the sole remainder above ground of the ecclesiastical college founded in the reign of Edward III. by John Pyel, Lord Mayor of London, and completed by his widow. The high tower, with its octagonal lantern of three stages, was apparently utilised for domestic apartments. It was entirely taken down twenty years ago, and rebuilt on identically the same lines with the old materials. In the south chapel is the tomb with effigies of John Pyel and Joan, his wife. Near by is a later and much more elaborate canopied tomb in Purbeck marble. This, as Mr. Hope pointed out, is one of a large class to be found all over the country, which seem to have originated from one particular town or shop—probably London—and were all of practically identical design, the only individuality being in the inserted brass at the back. The collegiate stalls remain in the chancel.

(To be concluded.)

SOME WORKS OF THE LATE MR. J. M. WHISTLER.

Is architecture "gefrorene Musik," as Schelling (and others) have said? Is pictorial art melting music, according to Mr. Whistler? Who can say, with any expectation of remaining uncontradicted? It depends, as we venture to think, so much upon the architecture, the art, and the music.

But this may be safely predicated in any case—namely, that it needs no fanciful titles in order to establish either artistic or musical conception in compositions, these being qualitative, irrespective of any such adventitious provisions. For our own part, we are repelled by such attempts to force the opinions of the public. If a picture, as is often the case, needs a discriminating title, as, for example, "The Bath of Psyche" or "A Visit to Esculapius," then it should, of course, be supplied. But had Lord Leighton called his fine work "Girl Hesitating at the Edge of the Bathing Pond," or had Poynter called his work "95° in the Shade—Clothes at a Discount," it would have been quite jejune.

And having thus prepared the way, let us now pay some detailed regard to the small but interesting loan collection of Mr. Whistler's art on view at the Tate Gallery. The gems are three of the oil-colour exhibits, "The River at Westminster," "Battersea Bridge" (No. 14), and "Cremorne Lights" (No. 19)—we will omit the fanciful portion of the

titles. These three are poems in colour and treatment; the first shows a dull dark-greyish-blue pall, with a suggestion of pervading half-light, and is fascinating. But equally pleasing in another vein is the "Battersea Bridge," for here is no haziness, no pall, no mystery, no crépuscule or nocturne in title or in suggestion; it is Battersea, a piece of London, as Londoners know it, with the proper local touch and pretty colouring, and with sufficient human interest in it to remove it from the ranks of the merely topographical sketch, and it is in every sense good and pictorial. The third gem needed no adventitious entitling; it could stand entirely on its own undoubted merits.

When Mr. Whistler's name reverts to mind, people almost inevitably think of one of his finest works, the portrait of his mother; this is not in the collection now on show, though reference is made to it in regard to another portrait exhibited, that of Miss Alexander (No. 20)—but what a difference! For here the pose is poor, the flesh-tints are dirty, the face is out of drawing. "Calle, Venice," is a pastel study on brown paper, slight in nature, but forming a pretty little colour sketch, and providing nice atmospheric effect.

Being so addicted to fanciful titles, why did not Mr. Whistler call his water-colour study (No. 6) "A Vertigo in Canary-yellow and Black"? "The Salute, Venice," is an atmospheric pastel study of the well-known Venetian church, but is scratchy. "Blue and Violet" might have been suitably entitled "A Diaphony in Blue and Flesh-tints," for it consists of a gracefully-posed draped girl (if such diaphanous material can be called drapery).

The artist had certainly a good command of figure-drawing, as the last-named and other pictures make manifest; we may also mention his pastel studies "May" and "La Jeunesse." "Chelsea" (No. 21) is good, but is not on a level of excellence with "Cremorne Lights," and this, too, may be said of "The Thames" (No. 23), though the last-named is not only good, but is also poetical. In "The Two Little White Girls" we note the first satisfactory flesh tinting, and the picture composes well.

"The Fire Wheel" is very clever, vigorous and poetical; this is one of Whistler's many nocturnes, and certainly merits the title. "The Conversation" supplies graceful posing for the two ladies, and is a prettily touched-in pastel sketch. The last of all catalogued, "The Beach" (38), is full of light and atmosphere; but when that is said it is but a very slight sketch.

The exhibition is, however, one that should and will be visited, as it undoubtedly appeals to various tastes, and is the work of a man who was thoroughly in earnest and one who was able to translate his thoughts into colour to an extent to which very many artists might aspire, but would aspire in vain.

QUEBEC BRIDGE.

In the last annual report (1910-11) by the Department of Railways and Canals of the Dominion of Canada an interesting account is given of the rebuilding of the Quebec Bridge after the disaster of five years ago.

On August 29, 1907, the cantilever bridge in course of construction by the Quebec Bridge and Railway Company (originally commenced under a subsidy of 1,000,000 dollars) suddenly collapsed.

Under the terms of an agreement with the company, dated 1903, the Government had undertaken to guarantee the principal and interest of the bonds or other securities of the company to the limit of \$6,678,200, the company releasing claim to the balance remaining unpaid of the said subsidy, such guarantee to be secured by mortgage on the company's franchises, tolls, and property. On February 1, 1904, a mortgage trust deed was executed, conveying to the Royal Trust Company (Montreal), as trustees, all the property and franchises of the company, and providing for the issue of bonds accordingly.

It was provided in this agreement that the Government should have the right at any time, on one month's notice, to take over the company's undertaking, assets, property, and franchises on paying the shareholders the amount of their stock at par, not exceeding \$265,585.70, with simple interest at 5 per cent. and a premium of 10 per cent. on the par value of the paid-up shares.

Of the said subsidy of \$1,000,000 there had been paid to the company a total of \$374,353.33 prior to the execution of the above agreement; and, subsequent to its execution, payments were made from the proceeds of their bonds to the extent of \$5,016,453.66 on certificates of the Government engineer covering work done and materials delivered.

After the collapse of the bridge, the right of the Government to take over the company's undertaking was exercised under the authority of an order in Council. The date of assumption was December 1, 1908. The total of the amounts paid by the Government to the several shareholders for their shares was \$355,279.07. The deed of assignment and transfer from the company to the Government was dated October 13, 1909.

Under authority of an order in Council of August 1908, a Board of three engineers was constituted for preparation of a new design and specifications, and for the reconstruction of the bridge, with powers to call in expert engineers as advisors on points of difference that might arise.

Towards the close of the year 1909 such progress had been made that newspaper notice was given in November of that year inviting contractors to visit the office of the Board in order to obtain information to enable them to prepare offers for the superstructure on the Board's plans and specifications, intending contractors being, however, invited to submit alternative designs.

In June 1910 the formal call for tenders was made by newspaper advertisement. In response, thirty-five different propositions were submitted, which were duly considered by the Board, who finally, after calling in advisory engineers, recommended the acceptance of an alternative design sent in by the St. Lawrence Bridge Company (with whom are associated the Dominion Bridge Company and the Canadian Bridge Company). This design the Board considered to possess certain features of strength, simplification of erection, economical distribution of material, and general appearance which, in their opinion, would produce a bridge that "would compare most favourably with the highest type of long span bridges in existence." By an order in Council of March 31, 1911, a contract was entered into with the conjoined companies named. The contract price is 9.02 cents a ton, and will aggregate about \$8,650,000, a saving of about \$2,600,000 having been effected by the elimination of the highways for vehicular traffic contemplated in the original design. The contract date for completion is December 31, 1915.

The bridge when constructed will have a total length of 3,228 feet, or about three-fifths of a mile. The centre span will be 1,800 feet long; the length of the suspended portion of it will be 640 feet. This span will for a length of 760 feet over the channel of the river have a height of 150 feet between its lower members and the high-water level of the river. The two cantilever arms will each be 580 feet long. The width of the bridge between trusses will be 88 feet. The bridge will comprise a double-track railway and two sidewalks for foot passengers.

Under date of January 10, 1910, a contract for the substructure was entered into with Messrs. M. P. & J. T. Davis, whose tender was the lowest of three obtained after newspaper advertisement calling for tenders, and two supplementary agreements (necessitated by changes in the caisson design and in the location of the north anchor pier) were made with them.

The Board of Engineers for reconstruction, as originally constituted, has been modified by retirements, and is at present composed as follows: Charles N. Monsarrat, M. Can. Soc. C.E., chairman and chief engineer; Ralph Modjeski, Am. Soc. C.E.; and C. C. Schneider, Can. Soc. C.E., and past-president Am. Soc. C.E.

The headquarters of the Board are in Montreal.

The expenditure for the past fiscal year up to March 31, 1911, was \$227,563.40, adding to which the expenditure for the year 1908-9, \$422,867.12 (in which is included the amount, \$355,279.07, paid for acquiring the stock of the Quebec Bridge and Railway Company, and \$31,765.44, the expenses of the commission of inquiry into the causes of the collapse of the old structure), and also adding the expenditure for the year 1909-10, \$111,782.02, for the preparation of plans, &c., the total Government expenditure amounts to \$762,218.54, against which there is to be credited the sum of \$100,000 paid to the Government by the Phoenix Bridge Company, the contractors for the original superstructure, in the final adjustment of claims arising out of the collapse, leaving the net cost to the Government up to March 31, 1911, \$662,218.54. This is irrespective of the amount of subsidy, \$374,353.33, paid to the Quebec Bridge Company, as above mentioned.

The report of the Board of Engineers of work on the reconstruction of the bridge for the year ending March 31, 1911, is as follows:—

Masonry.—Very little material progress was made in the actual construction of the masonry during the past year.

The caisson for the north main pier was built and floated into position, and actual work of sinking was started. Owing to an accident to the north main pier caisson after sinking operations had started, the concrete already deposited had to be removed, and the caisson placed in dry dock for repairs. Owing to the difficulty of sinking a caisson of such large dimensions it was decided by the Board to use this caisson for the south main pier, where the river bed was composed of material much easier to penetrate, and to construct the caisson for the north main pier in two sections. As soon as the weather permits in the spring and the necessary repairs have been made, it is the intention to have the caisson floated out of dry dock and placed in position on a prepared bottom. This caisson will probably be left in this position until next spring, the whole efforts of the contractor being directed towards the sinking of the north main pier. The existing north main pier was demolished. The facing stone of this pier will be re-used in the new pier.

Superstructure.—Tenders were called for the construction of the superstructure on July 1, 1910, and were opened on October 1, 1910. Contractors were allowed to submit plans of their own and prices thereon in addition to tendering on the Board's plans. Four firms tendered—namely, St. Lawrence Bridge Company, Pennsylvania Steel Company, British Empire Bridge Company, and Maschinenfabrik Augsburg-Nürnberg A. G. It was finally decided to recommend the acceptance of a tender submitted by the St. Lawrence Bridge Company, on a design of their own.

Removal of Debris.—During the past year the contractor has removed practically all the debris between the main pier and the anchor pier. All steel around the main pier that might interfere with the sinking of the caisson was also removed.

Removal of Approach Spans.—A contract was awarded the Phoenix Bridge Company for the removal of the approach spans and falsework on both the north and south shores. When the work ceased at the beginning of the winter the approach spans and falsework on the north shore had been removed, and a start made on the south shore.

Tests.—A series of tests were made during the past year for the Board by the Phoenix Bridge Company. This series consisted of sixteen tests of model compression members and fifty tension tests of eyebars. These tests furnished the Board with important information in regard to the physical properties of actual bridge members, such as were proposed for the new bridge. A short discussion is given in a report dated August 1, 1910, forwarded to the Department.

A further series of tests are proposed by the Board on other types of members to be used in the finally approved design of the bridge.

ILLUSTRATIONS.

BRANCH LIBRARY, MONKWEARMOUTH.

This building is the gift of Mr. Andrew Carnegie to the Sunderland Corporation, and was designed and carried out under the supervision of Mr. Edward Cratney, architect, Wallsend-on-Tyne, whose designs were placed first in an open competition. The building has been planned with a view to working the library with as small a staff as possible. The principal rooms are grouped round the entrance hall, which gives access to all parts. The delivery counter is so placed that the librarian has direct supervision of all the main rooms.

The library is arranged on the "safeguarded" open-access system. The walls are built of Withnell bricks, with Springwell stone dressings, and the roofs are covered with green Westmoreland slates. The floors of the main rooms are laid with maple wood blocks. The whole of the woodwork in the main rooms and the interior fittings are of oak.

The contractor was Mr. Joseph Huntley, of Sunderland. The carving was executed by Mr. Christian Neuper, Newcastle. The delivery desk was furnished by Messrs. Robson & Sons, Newcastle. The whole of the fittings and furnishings were carried out by Messrs. Laidler Robson, Ltd., Sunderland, to the designs of the architect. The heating system, hardware and entrance gates were carried out by Messrs. Emley & Sons, Newcastle. Mr. T. Cooke, Sunderland, was clerk of works.

MR. ARCHIBALD C. DICKIE, A.R.I.B.A., has been selected by the Education Committee for recommendation to the Chair of Architecture at Manchester University. Mr. Dickie has been one of the Instructors at the Architectural Association for some years, and we feel confident will fill the Professorial Chair with success.

INTERIOR DECORATION.—III.
GREAT BRITAIN.—I.—TRANSITIONAL PERIOD.—
RENAISSANCE.

By ALBERT E. BULLOCK, A.R.I.B.A.

(Continued from page 42.)

THE three concluding articles of this series will each cover a period of about a century, commencing with the year 1520 or thereabouts, when Wolsey was engaged at Hampton Court Palace in beautifying his closef and other parts of this early renaissance structure, and incidentally building a residence for his own occupation, to 1619, the date of the erection of the Banqueting House, Whitehall. The second takes in the work executed in the principal reigns of the Stuart line, covering that of Inigo Jones, Wren, and others; while the third division will be concerned with the Hanoverian accession, and carry us well into the reign of Queen Victoria, giving a general survey of the work of the Adam Brothers, Morris and Pugin, and Alfred Stevens, &c., a chronological list of useful data being appended.

Our object is to mark the progress of the arts by these three distinct divisions, rather than by reigns which are often somewhat misleading, although there are characteristic features in each reign forming sub-divisions which will be treated in their order.

The uniformity of detail noticeable in the work of the various Mediæval monastic orders had not died out when the Renaissance was introduced. The practice obtained throughout England, and is observable in the union which existed among the masons and artisans, whose work—especially the branches relating to joinery, plaster work, and masonry—is to be found in similar treatment in widely removed districts.

This was so also in the periods covered by the second division, but in a less degree towards the closing years, except in ecclesiastical edifices, which maintained their Gothic tradition throughout, in spite of Wren's noble effort to convert them to the Italianised manner.

This latter branch, however, does not come seriously within the purview of these articles, one or two notable examples only being referred to.

In the last division there were many ups and downs, even amounting to chaos, as it appears to us, viewed from the perspective afforded by the lapse of years, the redeeming feature being the bold work executed under the Georges, which was the natural offspring of the earlier examples left by Inigo Jones and Wren. The early years of the nineteenth century are marked by much individual specialisation and a veritable fight between the Mediæval and Classical schools.

With the death of Henry VII. the full-flavoured Gothic saw its doom, its last expression being rendered at King's College Chapel, Cambridge, and the Lady chapel at Westminster Abbey, in the centre of which is to be seen the first work of the transition—namely, the tomb by Torregiano—where there also existed a reredos and altar by him, now destroyed.

Our reference to the Abbey calls, incidentally, for some remark upon the wonderfully unique collection of monuments of all ages contained in that fane, from which may be traced more effectually than in any other edifice the changes which transpired in the masons' art or craft.

Torregiano's presence in England was, perhaps, not so much an event of purpose as it was of accident consequent upon his unconquerable jealousy of Michael Angelo Buonarroti, upon whom he left that mark of his displeasure and envy at the skill and enthusiasm that sculptor exhibited in his student days, which resulted in a permanent facial deformity. His expulsion from Rome led his steps, in common with other foreign workers, to England, having doubtless heard of the grandeur of the Court of Henry VIII., and he consequently sought employment from Wolsey and the King.

The works at Hampton Court date from about 1515, or six years after Henry VIII. ascended the throne, but the decorative work can hardly have been executed before 1520. The Great Hall was built between 1531 and 1533. Nonsuch House was Henry VIII.'s hobby, and the following account may not prove uninteresting:—

Evelyn supped in Nonsuch House, Surrey, on January 3, 1666, "whither the office of the exchequer was transferr'd during the plague, at my good friend's Mr. Packer's, and took an exact view of the plaster statues and bass-reliefs inserted 'twixt the timbers and punchions of the outside walls of the Court; which must needs have been the work of some celebrated Italian. I much admir'd how it had lasted so well

and intire since the time of Henry VIII., expos'd as they are to the aire; and pity it is they are not taken out and preserved in some dry place; a gallerie would become them. There are some mezzo-reliefs as big as the life, the storie is of the Heathen Gods, emblems, compartments, &c. The Palace consists of two courts, of which the first is of stone, castle like, by the Lo Lumlies (of whom 'twas purchas'd), the other of timber, a Gothic fabric, but these walls incomparably beautified. I observ'd that the appearing timber punchions, entrelices, &c., were all so cover'd with scales of slate that it seem'd carv'd in the wood and painted,* the slate fastened on the timber in pretty figures, that has, like a coate of armour, preserv'd it from rotting. There stand in the garden two handsome stone pyramids, and the avenue planted with rows of faire elmes, but the rest of these goodly trees, both of this and of Worcester Park adjoining, were fell'd by those destructive and avaricious rebels in the late warr, which defaced one of the stateliest seats his Majesty had."

An even earlier example in which the transition is noticeable is the north side of the Star Chamber (1500 A.D.), which was removed to Leasowe Castle, Cheshire, in 1836, the seat of the Hon. Lieutenant-Colonel Cust.

We may gather what constituted the decoration of an early interior from Shakespeare's description of Imogen's chamber:—

It was hang'd
With tapestry of silk and silver; the story
Proud Cleopatra, when she met her Roman,
And Cydnus swell'd above the banks, or for
The press of boats or pride: a piece of work
So bravely done, so rich, that it did strive
In workmanship and value; which I wonder'd
Could be so rarely and exactly wrought.

The chimney
Is south the chamber, and the chimney-piece
Chaste Dian bathing: never saw I figures
So likely to report themselves: the cutter
Was as another nature, dumb; outwent her,
Motion and breath left out.

The roof o' the chamber
With golden cherubins is fretted: her andirons—
I had forgot them—were two winking Cupids
Of silver, each on one foot standing, nicely
Depending on their brands.

There is a notable difference discernible in comparing the decorative work of England with that of either France or Italy, that whereas in the countries last mentioned the painter was pre-eminent, in England he was very much at a discount, the decorations being mainly obtained by the effect of tapestries, wood panelling, plaster ceilings and friezes, with few exceptions, as in the great chamber at Gilling Castle, where the frieze is painted and armorial bearings figure largely, as they do also at every turn at Boughton House. Later on the ceiling spaces increase in size, and the painter is given an opportunity which in certain cases even extends to the walls, as at Chatsworth, where Verrio's decorations are to be seen in the chapel of one of the State bedrooms, which is painted from floor to ceiling, and even over the jib door.

The work of Streater at Swakeleys, and Thornhill at Stoke Edith, is less offensive and bombastic, if it is, as in some of the examples of the latter artist, a little overpowering.

The evolution of the wood panelled wainscot work forms an interesting study, there being a traditional sequence from mediæval days, as has been clearly shown in Messrs. Gardner and Stratton's "Domestic Architecture of the Tudor Period." Prior to its adoption, the stone walls of the hall in most of the larger mansions and castles were ornamented with trophies of the hunt and warfare, and the smaller rooms were hung with tapestries.

English domestic life, differing largely from that of Italy or France, was fostered by the comparative peace which was maintained. There were few invasions, if there were many civil wars, and fewer marauding bands of troops likely to molest the peace of the inhabitants between the reigns of Henry VIII. and Cromwell, whereas Continental history bristles with strife. Our decisive wars with foreign nations being chiefly fought at sea, and internal or civil wars mostly

* This system of slate covering has been called into question owing to Pepys saying it was lead gilt, but there is in Tudor Street, Exeter, an old house which at one time was covered with tiny slates about 6 inches by 3 inches with scalloped ends, a portion of which still exists to the verandah or bay roofing. There are other houses similarly treated at Dartmouth. Pepys tells us that he saw many fine paintings at Nonsuch, apparently the work of either Rubens or Hans Holbein.

THAME PARK, OXFORDSHIRE.

confined to distinct areas, resulted in the preservation of many specimens of ancient, mediæval, and good renaissance work, from which one can compile a fairly accurate account of its development.

The foreign talent employed by Henry VIII. and Wolsey is responsible for much of the change that took place in the decoration of the ceilings and interiors of English mansions. Nor was this employment of foreign talent confined to Tudor times, for in the seventeenth century our intercourse with Holland caused many changes to take place in the decoration and construction of English mansions, as the introduction of the sash window about 1670, the effect of which was to alter the whole complexion of interior design, bringing about that verticality of treatment associated with French work.

We owe the extraordinary preservation of Wolsey's closet to its having been bricked up for over two centuries. The room is wainscotted with linen carved panelling to a height of about 8 feet, over which are painted canvases of a continuous historic subject, occupying three sides of the room. The fireplace, window mullions, and reveals are stone; the leaded lights are of the diamond shaped order. The ceiling is

composed of small panels, square and lozenge shaped alternately, divided by wood ribs. The joints are covered by a large headed nail, which secures four lead leaves, doubtless owing to the method of mitreing being then, apparently, unknown.

The colouring of the ceiling and frieze is chiefly azure blue and gold, which combinations obtained in most of this class of work upon the Continent. The devices on the moulded papier-maché panels are the Prince of Wales's feathers alternating with the Tudor rose, while the frieze is allegorical with the motto R*DOMINVS . MICHI . ADIVTOR recurring at intervals, which is similar in treatment to the frieze of the Tudor room at Magdalen College, Oxford.

The panelling at Boughton Malherbe manor-house has carved panels with a dark blue ground. The pattern—with reversing curves having vine and grapes ornament, heraldic and other devices—is similar in treatment to that at a farm house in Kent; Layer Marney Towers, Essex, and the door of St. Clement's, Norwich. The Italian arabesque frieze is, however, applied, not carved out of the solid, as are the panels.

The examples of carved panels from Waltham Abbey, now

in the South Kensington Museum, are of considerable interest, as showing the early jointing by means of the mason's mitre. The panelling at the Guildhall, Exeter (1556), is so executed, the upper panels having semicircular heads, the inner mouldings of which are carved in a variety of ways, giving a pleasing variation to the long, continuous row of panels. The building was carefully measured in 1875 by Mr. J. Crocker, of Exeter, and published in the *Building News*, and subsequently in a monograph he wrote in conjunction with the half-timbered (or pan and post) houses, interiors and ceilings of Exeter.

At the Commandery, Worcester (the Hospital of St. Wulstan, founded 1085), there is some very early panelling with vertical ribs. The ceiling ribs have carved bosses of earlier Tudor origin, but the Prior's room, here illustrated, has the usual sixteenth-century panelling of the time of Elizabeth, and was probably one of the alterations carried out by Thomas Wylde. The very fine Elizabethan bed forms a central object in the photograph. In Henry Shaw's "Specimens of Ancient Furniture" (1836) there are coloured illustrations of several notable beds of all periods, notably the velvet bed from Hardwick Hall and those from Goodrich Court and Ware; the last mentioned is immortalised by Shakespeare's Sir Toby Belch.

Haddon Hall, Derbyshire, contains panelling of several periods, from the time of Sir Henry Vernon's occupation (deceased 1515) to much later date. The long gallery (1530 to 1624) was altered in the time of Sir George Vernon, who died in 1567, and Sir John Manners made further additions.

The panelling in the drawing-room is later, having mouldings within the panels. The dining-room panelling is plain, with the exception of the frieze panels, which are carved with heads and other devices. The windows contain several different periods of glazing.

In the round tower of Thame Park, Oxfordshire, is a very old panelled room with Tudor linen carved panels, a rather later frieze of panels carved with busts in the roundels, and an ornamental frieze of very similar character to that of Wolsey's closet.

Judging from the portion of the ceiling which remains, the example would date a little later, or about 1530 A.D., and is based on the old system of wood formation. In early ceilings the construction of the floor above was clearly indicated, the main beams being moulded and the cross joints intersecting a few inches above the soffit. Bosses and tracery formed the principal decoration, as is instanced in the example illustrated in Messrs. Gardner and Stratton's work before mentioned, taken from the Palace Yard at Westminster.

(To be continued.)

SEWAGE TREATMENT—ADVANTAGES OF LAND OVER ARTIFICIAL SCHEMES.*

FROM the Public Health Act of 1875 passing into law to a very recent date, it was the invariable practice of the Local Government Board to refuse sanction to any loan for sewerage or sewage disposal works where there was no provision of a suitable area of land for sewage outfall works (usually called a sewage farm); a very wise precaution, because such land not only provided a site for whatever works might be adopted, but also for the deposit of house refuse where it could be properly dealt with, and if properly laid out would deal with the sewage in all exigencies, accidents and instances where artificial schemes failed. But recently the Local Government Board, with its present President, has not strictly adhered to this rigid stipulation. The agitation against it was very strong for many years, and led to the appointment of a Royal Commission on May 7, 1898, with Lord Iddesleigh, C.B., as President, to inquire and report:

I. (1.)—"What method or methods of treating and disposing of sewage," &c., "may properly be adopted," &c. (2.) "If more than one method may be so adopted, by what rules, in relation to the nature or volume of sewage, or the population to be served, or other varying circumstances or requirements, should the particular method of treatment and disposal to be adopted be determined"; and

II. "To make any recommendations which may be deemed desirable with reference to the treatment and disposal of sewage."

The first result was the issue of a short interim report in 1901, which expressed the opinion that downward filtration and broad irrigation were the best means to adopt; the Local

Government Board's rule for insisting on land was a good one; stiff clay land was unsuitable, but no land was useless. Much depends on the depth of top soil, but a larger area helps.

The report then dealt with artificial processes then in use—namely, closed and open septic tanks, chemical treatment, subsidence tanks, contact beds and continuous filtration in various combinations, arriving at the conclusion that it is possible to do with artificial schemes in some cases (Leeds and Manchester), but no general rule was possible for dispensing with land.

At the health congress at Exeter, August 1902, Lord Iddesleigh is reported to have said: "They (the Commission) would soon, he hoped, be able to publish the results of a prolonged investigation into the treatment of sewage on land; their experts were now making elaborate parallel examinations of some of the processes of filtration by artificial means..." "The subject was inexhaustible." The position seems to be much the same to-day. The Commission is still investigating, but has issued seven reports, of which, for the purpose of this paper, the fifth is interesting. It refers to 144 meetings and the examination of 204 witnesses.

On page 18 we read: "It is true that at (several towns are named) and elsewhere crude sewage has been satisfactorily purified in filters with almost complete absence of nuisance, but at most of those places this plan has been abandoned, because of the rapid choking of the filters." Page 22: "As regards the second claim, we find as a result of a very large number of observations, that the sewage issuing from septic tanks is, bacteriologically, almost as impure as the sewage entering the tanks." Page 44: "In the majority of cases we think it would be better to adopt chemical precipitation rather than septic tanks as the preliminary process for very strong water-closet domestic sewages."

Contact beds and percolating filters, with sprinklers or other distributors, are more favourably spoken of, the latter being the more efficient. After very exhaustive detail of automatic gear, loss of capacity, construction, dimensions, size and grading of filtering material, cost, &c., and a general summary favourable to percolating filters, except that they are more liable than contact beds to nuisance from smell and flies, we find these general conclusions, namely:—

"We are satisfied that it is practicable to purify the sewage of towns to any degree required, either by land treatment or by artificial filters, and that there is no essential difference between the two processes, for in each case the purification, so far as it is not mechanical, is chiefly effected by means of micro-organisms."

"The selection of a method of sewage disposal should depend primarily on local conditions."

"If a sufficient quantity of good land, to which sewage can gravitate, can be purchased for about £100 an acre, land treatment would usually be the cheapest method to adopt."

"In cases where only clay land is available, it would generally be cheaper and more satisfactory to provide artificial filters."

In comparison of effluents "judged by chemical analysis," the report says, "both classes of effluent possess similar qualities."

As regards eight farms not eliminating suspended solids, the average purification was about 98 per cent. as regards seven contact bed plants, but eliminating suspended solids 93.4 per cent.; as regards six installations of percolating filters, after eliminating suspended solids was 99.4 per cent.

There is one other great disadvantage in contact beds and percolating filters which applies to a great number of cases—i.e., where a low-lying district or area gives a low gradient to the stream which has to receive the effluent. Land treatment presents no difficulty. Screening and detritus chambers can be made shallow, and the carriers follow the contour lines, but the depth of each contact bed or percolating filter must be added where adopted, often necessitating raising the sewage.

Attention was then directed by the author to successful instances of land treatment at Redruth (Cornwall), Wokingham (Berks), the Berlin sewage farms (43,009 acres), and the Aldershot Camp Farm.

An interesting discussion arose on the paper contributed by Mr. John Manley, C.E., when Colonel Jones who, at the age of eighty years, is retiring from the management of the Aldershot Camp Farm, said that the profession of the civil engineer as defined in the Charter of that Institute was that they should apply the great sources of power in Nature to the use and convenience of man. It was not that they should try to destroy all the microbes they found, but that they

* Abstract of a Paper by Mr. John Manley, C.E. (Member of the Sanitary Institute), read at the Sanitary Institute Congress.

should give facilities for their action. He was always a believer in the microbes which existed in the land, and he thought it was pretty well acknowledged now that the natural purification was most effective. It was true that they tried to force the microbes to do more than they wanted to and the result was clogging of the filter beds. It was becoming more and more understood that land must be properly attended to, and from the first he had tried to get the best agricultural labourers he could, and interest the men in their work; and he believed a great deal of the success he had attained was due to the admirable assistance he had received from old-fashioned agricultural labourers. A sewage farm could not be managed like an artificial system according to fixed rules, but the attention of the employees from the highest to the lowest must be constantly engaged if there was to be a success. Therefore, the Local Government Board were perfectly right in insisting on the proper management of the farm. It was no good simply pouring the sewage on the land and letting it take its chance, for it was this which led to the outcry against sewage farms. He had at first to fight chemical precipitation until Mr. Dibdin came to his rescue with the biological system. Now the cultivation of bacteria was becoming better known, and he was prepared to leave it to the younger generation. He viewed the promised land, but he could not enter into it himself.

Professor Tyndale said that as scientific adviser to the War Office he had for many years had intimate knowledge of the Aldershot Camp Farm. In the early days of his appointment he was asked to make a report upon it, and he had hoped to have shown that the whole system was wrong. He then advised the appointment of Colonel Jones, and with his advent the aspect of the place completely changed, and the farm was reorganised. A short time ago the question arose as to whether it would be more economical to adopt artificial sewage treatment at Aldershot instead of the farm. He made an inspection, and he found no artificial treatment which would give better results or effect any economy over the sewage farm. When the artificial treatment of sewage first came prominently before the public, as in all cases of this sort, the public seemed to rush headlong into the matter, and everything had to be biological treatment, just as now it seemed as if everything must be ferro-concrete. A vast number of artificial schemes were adopted, some of which were good, some indifferent, and some bad. He was a man of naturally open mind, and with the position he held he was obliged to have an open mind. He supposed there was no system of artificial sewage treatment with which he was not intimately acquainted, and he was not prepared to say that artificial treatment was a black sheep. There were, in his mind, thousands of cases where artificial treatment practically must be adopted, and where it gave all the results which could be desired. It was absurd in many cases to say they must have land treatment. On the other hand, he was very glad to think that since that wave of mania for artificial sewage treatment the poor old dying sewage farm had risen from the wreck, and there were many instances where the sewage farm was and would always prove to be the correct method.

Mr. Lacey (Oswestry) said he did not think the greatest advocate of artificial treatment of sewage would be at all inclined to lay down the proposition that it was superior to land treatment, given the proper land on which to deal with the sewage. There was no question at all but that the absolutely natural method was in every respect the best. But they owed something to science also, and the earlier attempts to deal with the matter scientifically did not deserve the sneers of Mr. Manley.

Mr. Upson (Maidenhead) pointed out that Aldershot was really a great natural bacteria bed, and he was surprised to hear what it cost to deal with the sewage, and thought there were many engineers who would be glad to do it at one-third the cost. He took it that everyone would like to treat their sewage on land, but they knew that in the neighbourhood of large towns that was absolutely impossible.

Mr. Watson (Birmingham) said he was acquainted with many men specially interested in biological treatment, and he did not know any who really condemned the land system. After all, a bacteria bed was only a concentrated sewage farm, and the whole process was a biological one. But they must not run away with the idea that because at Nottingham and Aldershot they had fine land for this method of treatment that therefore they could purify the sewage of Glasgow or Manchester or Bradford or Birmingham in the same way. At Birmingham they had bought six miles of the Valley of the Tame, and to cope with the increase of the population they found it necessary to cut 1½ acres a week. It was not

first-rate land, and in many cases they had had to pay £164 an acre for land almost of the nature of peat, which, of course, was throwing away ratepayers' money.

Dr. Fowler (Manchester) said he had read a great deal in the reports of the Royal Commission which had been of great use to him. One point to bear in mind was that if they poured sewage over freshly ploughed land for a certain time the effluent from that particular land would not be good. A good deal of the prejudice against land treatment was owing to the fact that the same scientific care had not been put into it as was perhaps the case with the more popular artificial methods.

Mr. Manley, in reply, said he had no wish to condemn artificial methods unnecessarily. All he suggested was that more care and consideration should be given to land treatment in certain cases.

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

II.—PLANS.—VAULTING.—TRIFORIA.—CLERE-STORIES.—COLUMNS.

(Continued from page 60.)

It was pointed out in the preceding article that in all Italian churches the derivation of the plan from that of the ancient basilica remained through all the styles. Generally, it may be observed that the Italians were singularly retentive of any plan they had once adopted. They never rose to the conception of one, for instance, such as we have in our cathedrals. If we take a large Pointed church of the fourteenth century, like Sta Croce at Florence, we find an aisled nave leading to the transept which is very wide, but which does not project much, if at all, beyond the aisles; and on its eastern face a very shallow choir, with a row of chapels, sometimes, as in the example above quoted, as many as five on either side of it.

In numerous instances the choir of these vast churches is square-ended, as, for instance, in the Dominican churches at Perugia and Lucca, and in those built by the Franciscans at Pisa, Siena, and Viterbo. The apsidal east end was, however, more generally used in the North of Italy, as in Sta Anastasia at Verona, in the two great churches built by the Dominicans and Franciscans at Venice, and in that raised by the latter at Bologna; but it is strange that the Italians should so very rarely have built an aisle and chapels round it, though they must have been aware of the singularly fine effects that their neighbours were achieving at the same time.

The reason for this is not very hard to find. Like the German architects of the thirteenth and fourteenth centuries, the Italians were extremely tenacious, and when, as was very often the case, a Middle Pointed cathedral or church was reared on the site of a Romanesque one the old aisleless apsidal termination was adhered to.

Square east ends are found in the cathedrals of Orvieto and Siena, and in the church of Sta Maria Novella at Florence, where it has quite an English appearance, lighted as it is by three large lancet windows completely filled with ancient stained glass of the most magnificent description.

The east end of Sta Croce is more Italian. It has, as already observed, a central apse and five chapels opening from the transept on either side, giving internally a range of no less than eleven altars, all opening directly into the transept. Externally, each aisle of the apse of Sta Croce is gabled, as at San Fermo Maggiore, Verona. Each transept is roofed with two gabled roofs facing the east, and below is a succession of smaller gables over the chapels. But the whole elevation is not so striking as might be expected from its extent and importance. The truth is, the arrangement of the outline is unskilful, whilst the detail is all as poor and meagre as it can well be. Indeed, the majority of the great brick churches built in Italy by the Preaching and Mendicant Orders cannot be said to compete in point of harmony of outline or delicacy of detail with those raised in Germany under the same influences at Erfurt, Halberstadt, Ratisbon, Lubeck, and elsewhere, or with that superb English example, now St. Andrew's Hall, at Norwich.

Perhaps the most pleasing, because they have aisles to their naves, and in some cases a procession path to their apses, are the Santi Giovanni e Paolo and Sta Maria del

Frari at Venice, Sta Anastasia at Verona, San Francesco at Bologna, San Lorenzo at Vicenza, Sta Maria Sopra Minerva at Rome, and those with which these articles are more immediately concerned, Sta Croce, the typical Franciscan town church of Central Italy, and Sta Maria Novella, as representative a work of the Dominicans, both in Florence.

A whole article might be devoted to the explanation of the various developments of plan which the necessities of the apse and its corona of chapels gave rise to. There is no feature in which so much varied ingenuity has been displayed by the mediæval architects, and to the French (of the North especially) the palm must be awarded in this matter. None others were so capricious or so bold. In Amiens, Beauvais, Bourges, Notre Dame at Paris, Rouen Cathedral, and Le Mans Cathedral, not to mention others, we find the most perfect arrangements—surpassed, it may be, in some respects, in that of Toledo.

At Clermont-Ferrand, Limoges, Bordeaux, Aach, Narbonne, and Toulouse, in the southern half of the country, the architect of Amiens undoubtedly gave all his lines and plans to the designers of those noble cathedrals, as undoubtedly he did to Cologne, and not improbably to Leon in Spain; for of all French apses that of Amiens is the most perfect. The east end of the church (formerly the cathedral) of St. Nazaire at Carcassonne approaches more nearly to the Italian arrangement than any of the writer's acquaintance in France. Here the apse, which is pentagonal, without procession path or clerestory, is separated from the crossing by one intermediate bay, flanked on either side by three square-ended chapels opening from the transepts, these chapels being divided from each other and the intermediate bay by open stone screens. Such an arrangement, it is almost needless to say, produces an effect of lightness and elegance unsurpassed by any work of its period, the first half of the fourteenth century, the ensemble being enhanced by the magnificent stained glass of the same period with which most of the windows are filled.

The Italians and Germans never attempted to compete with the French, for though they constantly made use of the apse, many of those built by German architects between the thirteenth and sixteenth centuries being of great beauty, as at Münster, Soest, Erfurt, Meissen, and Naumburg, it was in a far less happy way, and our own ancestors were early led to abandon it in favour of the square east end with its great wall of stained glass, which, though it may be as noble in its effect, is neither so ingenious nor so bold in its construction.

If we compare an ordinary Italian groined church with a French or English example, we shall find one very marked difference in their plans. In the former each bay of the nave is square, and hence each bay of the narrower aisle is oblong, with the greatest width towards the nave; in the latter, on the contrary, the aisle compartment is square, and that of the nave oblong, with its narrowest side towards the aisle. Hence in the former the points of support are farther apart, and at the same time, no doubt, the whole building loses much of its present scale. The Duomo at Florence, for instance, has but four bays in its vast nave, and the eye refuses to be convinced, by the practical measurement of the foot, of the real dimensions of the building. The object always seems to have been to obtain as few points of support as possible in a given area; but there is no real gain in this. The points of support in the Italian churches were larger, and the cost in the end was probably much greater than in the apparently more intricate and complex plans of the French and English architects. The science displayed in their planning was, therefore, of a superficial and mistaken description, and not really equal to that which marks the work of their northern competitors.

In Italian Gothic work we observe a spirit of horizontalism which opposes itself to the all-pervading verticality of our mediæval architecture. In the larger diameter of shafts, and in their frequent use as single supports, reminiscences of Greece or Rome readily suggest themselves. The Pointed arch, moreover, had not only to admit a rival, but even seemed unable to hold its own. The Italians loved the round arch, while they only tolerated the Pointed form. Ignoring buttresses, they tied their arches together with iron rods, and seemed to be incapable of those daring feats of construction so familiar to Gothic architects elsewhere.

Repose and breadth of effect had more charms for the Italian mind than the bold projections, the deep shadows, the mysterious intricacy, and the complicated details of the northern work. They had broken, indeed, with the simple lintel construction of Greece, but the arches of Rome were less easily forgotten, and their employment less readily renounced. The graceful campanile of Giotto at Florence

illustrates the peculiarities of Italian design touched upon, and they may be the more readily understood by the student who observes the contrast it presents to the towers and spires with which English eyes are familiar.

The great church of Sta Maria del Fiori—the cathedral of Florence—stands forth as a giant, disdaining ornament or smallness of detail. Its features are few, simple, and almost colossal in scale. The elaborate details of Giotto's tower, with the numerous parts of small dimensions, and the high finish, both of the design and its execution, bring out the hugeness of the Duomo by the force of contrast, while the tower, in its turn, gains somewhat in exchange.

The cathedral of Florence illustrates, first, the plainness and simplicity of plan already remarked upon. It was commenced by Arnolfo di Lapo towards the close of the thirteenth century, and shortly before his death, which occurred in 1300, and it is uncertain how far he had been enabled to carry his ideas into execution. He is usually credited with the general conception, the arrangement of the plan, and the construction or design of the vaulting, always excepting the dome, which was added long after by Brunelleschi. Arnolfo's design for covering the space now crowned by the dome is involved in mystery. It is supposed that he intended to raise his roof immediately over the piers and above the first cornice, so that the line of springing should coincide with that of the nave vaulting. He was an architect of great reputation, and was largely employed by the Florentines, some of his works still remaining as embellishments of their fair city. He united, as did most architects in those times, the practice of military engineering to that of his own art, and some portion of the outer defences of Florence were constructed by him. He designed the great municipal Palazzo dei Signori, as well as the loggia of Or San Michele, the church of Sta Croce, a huge cruciform building, with the arches of its nave carried upon octagonal columns, a lofty clerestory, low-pitched roof of wood, and an apsidal choir with five square-ended chapels on either side of it.

In the Duomo, Arnolfo has bequeathed to us the largest church constructed in Italy in the Middle Ages, and, although it presents many features unpleasing to a northern eye, is interesting as an example of late thirteenth-century Italian Gothic on a large scale.

How sharply the design of Florence Cathedral contrasts with such a building as Westminster Abbey may be seen by placing their plans side by side.

In the Italian church we have a nave 250 feet long but only of four bays, while in the English one we find twelve bays in a length of 233 feet. Each church is divided transversely into nave and aisles, but these divisions occupy a space of 125 feet at Florence and only 75 feet at Westminster. At Florence we find a grand central space surmounted by a Pointed dome, with an apsidal choir and transepts, also apsidal, all alike covered with semi-domes.

The Italians evidently admired the transverse-triapsidal arrangement as much as the Rhenish people of a much earlier epoch, and it was afterwards adopted for St. Peter's at Rome. This preference for a semi-circular form as the termination of the three arms of the cross may have been caused by reminiscences of the old basilicas. It is found in the Church of the Nativity at Bethlehem, and as remarked above, was not uncommon in the churches of Western Germany and that part of France neighbouring to it. In the former we find it in three of the Romanesque churches at Cologne—Sta Maria in Capitolio, the Holy Apostles and St. Martin, also in the early thirteenth-century churches of Bonn and Neuss, both in opposite directions about twenty miles from Cologne. Remarkable complete Gothic instances of this transverse-triapsidal plan may be seen in the Liebfrau-Kirche at Treves and St. Elizabeth at Marburg; while in France the great church at Noyon is, and the cathedrals of Cambrai and Arras, both destroyed in the cataclysm of the French Revolution, were similarly planned. Tournai Cathedral, beyond question the finest and most architecturally interesting of Belgian churches, preserves the old apsidal form of its transepts; its choir was rebuilt on a much more colossal scale at the end of the thirteenth century.

Such buildings illustrate the basilican arrangement of plan which Arnolfo adopted at Florence; and apart from all questions of style, they seem to deserve the attentive study of architects who are called upon to provide interiors capable of accommodating large numbers of persons.

In the churches of the Middle Ages generally, large free spaces were not felt to be required. The service was, on the worshippers' part, to be an act of faith, rather than of

THE GIDEA PARK COTTAGE

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

actual participation. Long naves and aisles were needed for processions, and long choirs for the clergy.

The English architect of the present day has other problems to solve, and may well find, in some of the simpler basilican plans, models deserving his careful attention.

The scale of the Duomo at Florence is too colossal to be pleasing, since it has the character of a small design unduly magnified. On entering the nave the four great arches, although well and gracefully proportioned, have a bare and unsatisfactory effect, and on passing from the nave to the central area under the dome, this feeling is intensified.

The nave should lead up to something grander than itself, and so indeed it is, as far as mere dimensions are concerned, for the dome is 137 feet in diameter, and about 280 feet high. These grand dimensions are, however, to a great extent, thrown away, by reason of the paucity of detailed parts of moderate size—notably windows, which in the Florence Duomo are miserably inadequate to the vast wall spaces, to serve as a scale for the whole.

The usual plan of single wide arches is sometimes deviated from and improved by having two bays of each aisle opening with two arches into each great vaulting-bay of the nave, so that every bay of groining throughout the church is very nearly square. This plan, which occurs in Sta Maria del Carmine, built in the fourteenth century, at Pavia, is a common one in the Early Gothic churches of Germany, as, for example, the cathedrals of Brunswick, Naumburg and Osnabrück, and the churches at Lippoldsberg, Marienfeld, Riddagshausen and Neuss—and is one of the many indications of similarity between German and Italian work which might be adduced were it within these limits to enter upon so engaging a question.

The same absence of subdivision is apparent in the elevation of each bay of an Italian church, where, in place of the

triple division in height of the great northern churches, with their well-accentuated proportions and beautiful variety of detail, we have, in such buildings as the cathedral at Arezzo, Sta Maria Novella, Florence, and Sta Maria Sopra Minerva, Rome, a singularly meagre design perpetually repeated, and consisting generally of simple broad arches with a small circular clerestory window above them, and no other kind of decoration, save where the painter has come with his ever-ready art to the rescue of the apparently incompetent architect.

As in France, Belgium, and Germany, vaulting in Italy was almost always much simpler than with us, rarely advancing beyond the plain quadripartite or four-celled one. In Italy, perhaps, this was intentional as giving free scope for the exercise of the painter.

Several large Gothic churches, notably the cathedral at Orvieto and Sta Croce, Florence, were never vaulted at all, and in very many cases the Romanesque churches still retain those low-gabled wooden roofs which, if somewhat rude in construction, are far more pleasing than the feeble ribless quadripartite vaulting which in almost all the Romanesque churches at Lucca was added in Renaissance days, when the clerestories were either built or rebuilt. The old wooden roofs, such as may still be seen covering Sta Maria della Pieve at Arezzo, San Miniato at Florence, Sta Maria Maggiore and San Pietro at Toscanella, San Giovanni Zoccoli at Viterbo, Sant Andrea at Pistoja, and San Frediano at Lucca, are at any rate truthful, while the flat coffered ceilings of the Renaissance such as we see in Sta Maggiore at Rome, Pisa Cathedral, and San Giovanni at Lucca do not accord ill with the early character of those buildings. The very wide churches without aisles, alluded to as having been built under the auspices of the religious orders, almost invariably have timber roofs; that at San Fermo Maggiore at Verona is of the most elaborate construction, taking the shape

LIVING ROOM.

DINING ROOM.

BEDROOM NO. 1.

BEDROOM NO. 2.

of a number of cusps. Such a roof as this hardly admits of intelligible description, and it must suffice to say that, filled as it is with intricate panelling, adorned with paintings of saints in long arcades, and spanning a church of some 50 feet in width, it would be difficult to instance a finer example anywhere. The construction is very much the same as that of our double hammer-beam roofs, supposing every pair of rafters to be framed to the hammer-beam shape, and boarded and panelled on the under side. Similar roofs may be seen in the church of the Eremitani, Padua, another vast aisleless church, and in San Zenone, Verona. The roofs covering the naves of Orvieto Cathedral and Sta Croce, Florence, two aisled and clerestoried churches of the first class, are the very simplest pieces of unaffected carpentry, with no ornament and but little enrichment in the shape of colour, and were probably introduced from the inability of their respective architects to cope with the difficulties attendant upon vaulting over such wide spaces. In both these churches the aisle roofs are of the simplest wooden lean-to kind.

As a rule the vaulting over cloisters in Italy is of a meagre, ribless description; we meet in them nothing comparable in richness and intricacy with the vaulting of our English cloisters, which, as the style of architecture grew later and richer, only increased in boldness and complexity.

The triforia and clerestories of the churches in Central Italy demand a few words. The former are comparatively rare, and are to be met with almost exclusively in churches of the Romanesque period. Pisa Cathedral has a most beautiful triforium arcade, composed in the nave of a continuous series of round-arched compartments, each of two divisions, which are separated by a single circular pilaret. The tympanum of the enclosing arch is solid, and the pier between each bay is composed of four pilasters grouped against a square nucleus. A remarkable feature in this cathedral is the manner in which the columns and arches separating the nave from its inner aisle on either side—for Pisa Cathedral is one of the very few Italian churches designed with double aisles—are carried across the arches opening into the transepts, and with them the triforium arcades. By this means the cruciform plan of the church is lost internally, but an appearance of greater length is conferred. Genoa Cathedral has also a fully developed tri-

forium, somewhat similar in character to that at Pisa. In the Genoese example there is no floor to the triforium gallery; consequently, its arcades are visible, as at Modena Cathedral, from the aisles, which thus attain an unusual height.

The choir of that most picturesque of Southern French churches—St. Paul Serge at Narbonne—the nave of Rouen Cathedral, and that of the collegiate church at Eu, near Tréport, present examples of the floorless triforium. Several churches in Genoa and its neighbourhood have their triforium arches visible from the aisles, so that this feature may be regarded as a local one.

(To be continued.)

A GIDEA PARK COTTAGE.

WE illustrate a typical cottage for this Garden City, the particular building being erected at the White City, Shepherd's Bush, its structural value, completely finished, being about £900. About one-third of this sum can, we understand, be saved by the use of still simpler finishings. It is but two years since the foundation-stone of the first house on this historic Essex Estate was laid, and it has developed very largely in the interval.

One of the attractions in all garden suburbs must be the facility for speedy communication with the City itself; and in this instance, as there are some ninety trains in and out daily between Gidea Park and Liverpool Street, with a fast train run of only twenty-five minutes, this attraction is well satisfied.

Some misconceptions have arisen as to conditions of holdings; but it would seem that the Company desires to meet the wishes of proposing occupiers as far as possible, and are not only prepared to sell freehold, but alternatively to grant ninety-nine years' building lease or to enter into tenancy agreements.

The cottage illustrated is designed by Messrs. Bunney & Makins, and speaks for itself. We are not impressed by the amount of space, but it may be that a family of four would manage to shake down in it. The furnishing, by Messrs. Oetzmann & Co., Ltd., of Hampstead Road, is attractive, though we confess that it appears to us to be excessive in value, compared with the cost of the house; in a sample cottage it would have been advisable to exhibit furniture more in accordance with relative value.

THE LATE MR. W. J. BODDY'S CHURCH INTERIORS AND LANDSCAPES IN WATER COLOUR.

THIS was a pleasant little Exhibition at the St. George's Gallery, 108 New Bond Street; pleasant both for the architect and the general public. It was not so large as to promote weariness of the spirit, nor small enough to create a feeling of one's being drawn to the gallery without sufficient recompense.

The subjects of Mr. Boddy's sketches, if not ranging from John o'Groats to Land's End, still covered the large area between Cumberland and Devonshire, besides some Continental work. Indeed, it was only a selection of Mr. Boddy's sketches that were in reality exposed to public view; had all of them been produced the area of country covered would probably have been found to be much more extensive.

Throughout all, however, the chord of sincerity was struck, though, naturally, there were variant notes of more or less power. At times Mr. Boddy signally failed, when at other times, in the same class of work, he succeeded quite as signally; for instance, in No. 6, a sketch of the ambulatory in Westminster Abbey, the touching-in of the clerestory window, with its rich tones of colour, could not have been done better by Sir Wyke Bayliss himself. To those who know these windows there was a sense of being bodily transported to the fane when gazing upon this beautifully-rendered piece of colouring. But in some other works, such as those in Christ Church Priory and the Lady chapel at York Minster, the stained glass was very poorly represented, with a lamentable lack of "values" in evidence.

Mr. Boddy had a feeling for vistas, and in this connection may be instanced such sketches as "Tewkesbury" (No. 10), where the church tower fills in the background, and "The Market Place, St. Albans." Again, the artist could present sunny effects well, and wielded a good brush for depicting stonework; his sepia work was very vigorous. In "Mont St. Michel," "Whitby," and "Staple Inn, Holborn," we noted three of the best things in the collection. But, in truth, were we to name all that was worthy of inspection it would read like a catalogue, and, despite the merits of these works, this would make but poor literature. Therefore, we must be satisfied with the few individual references that indicate possibly their personal appeal to us, superadded to their undoubted merits.

ARCHITECTS' AND SURVEYORS' APPROVED SOCIETY.

THE Architectural Association, in conjunction with the Royal Institute of British Architects and the Surveyors' Institution, have had under consideration how best the interests of their members and those in their employ who come within the category of insured persons under the National Insurance Act may be promoted.

After consultation with insurance experts, they have come to the conclusion that the formation of a special "Approved Society" for Architects' and Surveyors' assistants and clerks would prove advantageous to those concerned, for two simple reasons, viz. :—

1. That their average health, as a class, is good.
2. That the proportion of persons passing out of the category of insured persons is higher than in non-technical professions and businesses; and that as a consequence the funds available for benefits in addition to those provided by the Act would be larger than in societies with a miscellaneous membership.

Subject to sufficient numbers being obtained, it has been decided to found such an approved society, and we should be glad to have (on the accompanying form) the names of any of your assistants or others who would be prepared to join.

As a membership of at least 5,000 is necessary in order to form a separate entity for insurance purposes, it is hoped that your support may be relied upon in furthering an effort which should prove of benefit to those in the professions who come within the provisions of the Act, by asking your clerks and others who are eligible and would like to join, to sign the enclosed form.

There is nothing to prevent persons who may have already enrolled themselves in a non-professional society from transferring their membership, and, for the reasons stated herein, there would seem to be definite advantages to be gained by their so doing.

All persons engaged in architects' and surveyors' offices and earning less than £160 per annum are eligible for membership.

It is of the greatest importance, owing to the shortness of time, that the enclosed form signed by the applicants, with their addresses, should be returned in the envelope sent herewith not later than September 16 next.

18 Tufton Street, Westminster, S.W.

August 8, 1912.

Dear Sir,—We enclose a circular with reference to the formation of an "Architects' and Surveyors' Approved Society" under the Insurance Act, 1911. The proposal is supported by the following members of the two professions :—

Sir Aston Webb, C.V.O., C.B., R.A.

Sir Ernest George, A.R.A.

Sir Alexander Stenning, F.R.I.B.A., F.S.I.

W. Edgar Horne, M.P., F.S.I.

Leslie R. Vigers, F.S.I.

G. Corderoy, F.S.I., and Professor Reginald Blomfield, A.R.A., F.S.A., President of the Royal Institute of British Architects.

A. W. S. Cross, M.A., F.R.I.B.A., George Hubbard, F.S.A., F.R.I.B.A., Ernest Newton, A.R.A., E. Guy Dawber, F.R.I.B.A., Vice-Presidents of the Royal Institute of British Architects.

Hon. Edward Gerald Strutt, F.S.I., President of the Surveyors' Institution.

John Farrer, F.S.I., W. Edward Woolley, F.S.I., H. Chatfield Clarke, F.S.I., F.R.I.B.A., Edward Blakeway P'Anson, F.S.I., F.R.I.B.A., Vice-Presidents of the Surveyors' Institution.

Gerald C. Horsley, F.R.I.B.A., President of the Architectural Association.

W. Curtis Green, F.R.I.B.A., Maurice E. Webb, M.A., Vice-Presidents of the Architectural Association.

We hope that you will give us every assistance in the matter.—Yours faithfully,

F. R. YERBURY,

Secretary Architectural Association.

IAN MACALISTER,

Secretary Royal Institute of British Architects.

A. GODDARD,

Secretary Surveyors' Institution.

NOTE.—All communications for the present to be addressed to the Hon. Secretary, 18 Tufton Street, Westminster, S.W.

Saturday, September 7.

Architectural Association Camera, Sketch, and Debate Club :
Walking Expedition, start at Dorking.

THE DANGER OF DEEP EXCAVATIONS.

WHILST it does not often occur in architectural practice that excavations are of such depth as to be termed "deep" when compared with those that an engineer has to supervise, it does occasionally happen that architects have to deal with basements and sub-basements of a considerable depth, and more often it is the case that the excavations for a building must be carried on in a soil which from its nature is prone to create danger, or from its confined situation and proximity to adjacent buildings is subject to risk. Hence the report of a Departmental Committee, appointed by the Secretary of State for the Home Department, on the dangers attending deep excavation, must be of interest to architects, even though the reference to the Committee limited their inquiry into such dangers "in connection with the construction of docks and other similar works." The Committee, however, did not limit their inquiry and taking of evidence merely to excavations in connection with docks, but appear to have considered that the inclusion in their reference of "other similar works" gave them considerable latitude and allowed them to obtain particulars of dangerous excavations for sewers, tunnels, reservoirs, canals, &c.

The evidence, which is voluminous, is interesting and obtained from witnesses of various grades, from chief engineers and contractors to timbermen and gangers. The timbering of trenches appears from the evidence to be of supreme importance and the adequacy of timbering a matter that often calls for instant decision of the man on the spot, so that the leading timberman should have considerable experience and have the call of a plentiful supply of timber. Although, as we have already explained, the main objective of the inquiry was deep excavations, it would appear that in such depths as 12, 14, or 15 feet, depths common enough in building work, there might be much danger from the improper or inadequate use of timbering, particularly when the contractor is a small man or a jerry-contractor. A big contractor with a really deep excavation is likely to take proper precautions, aided by an efficient staff of experienced timbermen, gangers, and assistant engineers, against an accident, which may very likely be serious and cost him thousands of pounds, but the small man, or the builder who has cut his price fine to get a job, will often take risks and leave an open trench at night insufficiently timbered, to find it in the morning fallen in, as has happened in our own experience and, no doubt, in that of many other architects. The accident might have occurred in the day-time and a man or two might have been buried alive, so although the scope of the Departmental Committee was with reference to deep excavations, and particularly those concerned with docks, the evidence obtained was instructive also for work of far less magnitude.

Indeed, in their general conclusions and recommendations the Committee state that, while giving special attention to really deep excavations, and particularly those in connection with the construction of docks, they have also considered what might be termed relatively shallow trenches. This explains why the report and the evidence are of value in architectural, as well as engineering practice. The Committee found a difficulty in precisely defining a deep excavation, but considered that as the more prominent dangers are associated with trenches exceeding 10 feet in depth, excavations under this limit should be exempt from the regulations they proposed for minimising the dangers of deep excavations.

The most threatening danger of deep excavations, in our opinion, is the falling in of the sides, and to the minimising of this the Committee gave the greater part of their time and attention; but after the examination of numerous witnesses, they came to the conclusion that the difficulty of fixing definite standards for timbering trenches is insurmountable. To begin with, the site may be on land wholly or partially covered with water, the soil to be excavated may be hard and compact, wet or dry, water-bearing or impervious to water, gravel, mud, running sand, clay, rock, or any combination of these. Not only is it impracticable to lay down rules which shall be applicable in all cases, but any preconceived plan of timbering for a particular job may be found, when the excavation has progressed a certain distance, to be quite insufficient, or possibly unnecessarily heavy. All the witnesses were agreed that the details of timbering must in the end be left largely in the hands of the timbermen. No amount of theoretical knowledge will teach anyone this work; it must be acquired by practical experience in the trench. Emergencies arise where prompt action is essential to avert catastrophes; hence it is highly important that only men of sufficient experience should be employed as gangers and timbermen.

Holding these views the Committee recommend that, although no definite rules universally applicable can be laid down as to the method to be adopted for supporting the sides of deep excavations, yet such trench work should in all cases be under the direct control of some person of wide experience above the ganger. They also recommend that all trenches should be carefully inspected in detail by a competent person at least once a day, and that a register should be kept at the works of the daily inspection of all trenches, with a record of the observation by the inspector of any unusual or special features of the work.

Specific regulations are suggested dealing with the use of explosives in blasting operations, which are largely based on quarry experience, but which we need not examine in detail, as they very rarely occur in connection with building operations.

The remaining recommendations of the Committee are

of obvious utility—the protection by fencing of persons from falling in to the excavations and in loose soils the use of skirting boards to prevent material falling into the bottom; the provision of fenced gangways across the excavations; the use of emergency ladders, and on a site covered with water of life-saving appliances; the proper lighting by night of gangways, intermediate landings, and the tops of ladders; the provision of ambulance appliances and the maintenance of existing regulations enforceable under the Factory and Workshop Act, 1901, affecting the generation and use of electricity; the annealing of chains, and the statutory provisions dealing with the examination of steam boilers; the reporting of accidents, however caused, and the powers of inspectors.

IN PRAISE OF SLATES.

By CLOUGH WILLIAMS-ELLIS.

(Concluded from page 80.)

THE size, shape, and thickness that the slates should be is for the architects to say. The quarries simply make what they are asked for, and up till now the chief demand has been for large thin slate, 20 in. by 10 in., and the like, no one knows why, save that it has somehow come to be the standard stereotyped specification, and has been blindly followed by succeeding generations of builders, and even architects.

The odd thing is, however, that these large lanky "Ladies," "Countesses," and "Duchesses," as they are termed (precedence going with size), are not by any means the cheapest, though their eminent suitability for commercial work generally and for the roofing of large areas seems sufficiently to justify their still reasonable price.

Undoubtedly the Festiniog group of quarries, being possessed of exceptionally high grade rock capable of conversion into these large size slates of extreme thinness (the test of good slate metal) have pushed this special line as being more distinguished than the making of small rough slates, slates that other quarries having only inferior rock could produce more or less successfully. Thus it is that one has come chiefly to associate with "Portmadoc" the "big thin slate of commerce," and even architects don't seem to realise that though the converse is not true, where such are made, any other size, thickness, shape, and, to some extent, texture of slate can be made much easier. You have merely got to state your wants and await delivery.

The large, light, thin slate, the "Pride of Portmadoc," is probably unassailably secure for all time, as the standard roofing, with reference to which all other materials the world over are classified and compared, but for domestic work, for cottage and garden city work, a homelier, humbler, more "textured" slate is demanded.

And the cost? Well, within limits the smaller and rougher the slate the cheaper it is, not only in the quarry yard, but on the roof, when due allowance has been made for the extra labour in laying, the extra battening and nails, and such small increase in the roof scantlings as may be necessitated by the slightly greater load of small slates as compared with large.

That is probably news to four builders out of five, and also, I'm afraid, to nine architects out of ten.

All things considered the 14 in. by 7 in. Portmadoc blue-grays are probably the cheapest roof material.

The *cheapest* form of the world's very *best* material. That is a bold assertion. It is for the quarries to make good, and they do.

"Portmadoc" is perhaps rather a misleading word to use—it being merely the *port of shipment* for the slates of the Festiniog district quarries—some half score in number, and a dozen miles and more away. Still, "Portmadoc" having come to stand exclusively for the products of these quarries, I employ the name as popularly understood to avoid confusion.

The following is an extract from "The Formation and Composition of Slate," by Moses Kellow, M.I.C.E., F.G.S. (London), who has courteously placed much technical information at my disposal.

CHEMICAL COMPOSITION.

The silicates of alumina and iron are chemically inert and incorrodible. The doubtful constituents are lime and magnesia, but the presence of these does not necessarily imply deleterious matter in the composition of the slate. Where, however, carbon dioxide is present a strong inference exists that the lime and magnesia will be found in the form of carbonate, in which case they are perishable.

From the following table it will be apparent that approximately nine-tenths of the best Welsh slate consists of chemically inert silicates, and that deleterious carbonates are entirely absent:—

Class of Slate.	Silicates.	Lime and Magnesia.	Carbon Dioxide.
Festiniog average of six analyses	89.42%	2.52%	None
Penrhyn, Bangor, Purple	86.69%	2.59%	None
Velinheli, Blue	88.57%	2.71%	None
Llangollen	76.77%	7.30%	3.71%
American Old Bangor	83.02%	7.07%	6.40%
American Albion Bangor	80.75%	6.19%	5.52%
American Vermont Sea Green	80.82%	5.61%	2.98%
American Vermont Red	79.94%	8.82%	3.77%

The corresponding figures for French slates are inferior to those given for American.

The remaining items of common occurrence in the analysis of Welsh slate consist of small percentages of the following:—

Potash, a constituent of muscovite.

Soda, a constituent of muscovite.

Titanic acid, a constituent of rutile.

Manganous oxide, a constituent of rhodochrosite.

Phosphoric oxide, a constituent of apatite.

Water of crystallisation.

None of the minerals here referred to are liable to decomposition by atmospheric agency.

STRUCTURE.

Structurally slate may be divided into two classes, which merge imperceptibly into one another—i.e. (a) Clay slate, consisting of the original elastic particles compressed together, the cleavage being due solely to compression; and (b) mica slate, in which the original material has been converted into mica, an elastic, strong, and highly cleavable mineral. As the plane of crystallisation of the mineral coincides with that due to compression, the cleavage of the slate is much improved, and its strength and elasticity are increased. Festiniog slate is a mica slate.

This deflection in a slate of commercial size and thickness is remarkably high, and denotes extreme toughness.

ROYAL ARCHÆOLOGICAL INSTITUTE.

(Concluded from last week.)

Tuesday, July 30.

THE members of the Archæological Institute always cover a wide area at their summer meetings, and that of 1912 was no exception. Besides traversing Northamptonshire in many different directions, with the county town as a starting-point, their lines of travel projected into both Rutland and Huntingdon. It was in the latter county that the members stood after an hour's railway journey to Elton. But their object took them immediately back over the boundary and into Northamptonshire again, for the first place on the programme was

FOTHERINGHAY CHURCH.

While this building is, as Mr. W. H. St. John Hope remarked, simpler in its architectural history than any of the others visited in the course of the summer meeting, it was not the least interesting. A church undoubtedly existed at Fotheringhay at the time of the Domesday Survey, because a priest is mentioned in connection with it, and an earlier church stood on the present site. Leland writing of the village some centuries ago in his charming, quaint way, said that it had "but one street, all of stone building. The glorie of it standith by the parochie chirche of a fair buildid, and collegiated. There be exceeding goodly meadows by Foderingey." The parish church referred to went on until the fifteenth century. By that time, among a good many other changes, the manor had passed by grant into the hands of Edmund of Langley, the fifth son of Edward III. and Duke of York, who is sometimes said to have founded a college here. But he only projected it, the foundation really being due to his son Edward, who succeeded him as Duke of York. The foundation included a master or dean, a precentor, thirteen chaplain fellows, eight clerks, and thirteen choristers. Before his death in 1415 at Agincourt the founder took down the chancel of the existing parish church and erected in its place "a mighty fine quire." The process of reconstruction was continued by Richard of York, who was minded to build a nave equal in magnificence to the quire. There exists for the latter work—that extremely rare thing—the mediæval building contract. It is dated 1434. Unfortunately the original is lost, and the transcript in Dugdale's "Monasticon" is inaccurate. According to Mr. Hope, the man who transcribed it could not read it properly, and had transposed at least one important passage besides making other blunders. The contract is of sufficient interest to warrant its reprint as below:—

Articles concerning the new building of this church.

This Endenture maad bitwix Will. Wolston, Sqwier, Thomas Peckam, Clerke Commissaries for the hy and mighty Prince, and my right redouthid Lord the Duc of Yorke on the too part; and Will. Horwode, Free-Mason, dwellyng in Fodringhey on t'other part; wytnessith that the same Will. Horwode hath granthid and indertaken, and by thise same hath indentid, graunts, and undertakes to mak up a new body of a Kirk joyning to the Quire of the College of

Fodringhey, of the same hight and brede that the said Quire is of: and in length xxiiij fete fro the said Quere downward withyn the Walles (a metyard of England accountid alwey for iij fete). And in this Cuvenant the said Will Horwod shall also wel make all the ground-werk (=foundation) of the said body, and take hit, and void hit at his own cost, as latlay hit suffisantly as hit ought to be by oversight of Maisters of the same Craft, which (=with) stuff suffisantly ordeigned for him at my seide Lord's cost, as longeth to such a werke. And to the said body he shall make two Isles, and tak the ground . . . hem in wise aforesaid, both the Isles according to height and brede to the Isles of the saide Quere, and in height to the body aforesaid; the ground of the said Body and Isles to be maad within the ende under the ground table-stones (=plinth courses) with rough stones and fro the ground table-stones bo . . . ments, and alle the remanent of the said body and Isles unto the full hight of the said Quire with clene hewen Ashler altogedir in the outerside unto the full hight of the said Quire, and all the inner side of rough stone, except the bench-table-stones, the soles of the Windows, the Pillars, and Capettels that the Arches and Pendants shall rest upon, which shall be altogedir of Free-stone wrought trewly and dewly as hit ought to be.

And in eche Isle shall be Wyndows of Freestones, accordyng in all Poynts unto the Wyndows of the said Quire, sawf they shall no bowtels haf at all. And in the West-end of aither of the said Isles, he shall mak a Wyndow of four lights, accordyng altogedir to the Wyndows of the said Isles. And till (=to) aither Isle shall be a sperware (=square) embattailment of Free-stoon throughout, and both the ends embattailed butting upon the Stepil. And aither of the Isles shall have six mighty Botrasses of Free-stone, clen-hewyn; and every Botrasse fynisht with a fynial, accordyng in all points to the fynials of the said Quere, saf only that the Botrasse of the body shall be more large, more strong and mighty than the Botrasse of the said Quere.

And the Cler-story both withyn and without shall be made of the clene Asheler, growndid upon ten (viii) mighty Pillars with four respounds; that ys to say two above joyning to the Quere; and two beneth joyning to the end of the sayd bodye. And to the two Respounds of the sayd Quere shall be two perpeyn-walls joyning of Free-stone, then wroght, that is to say, oon on aither side of the myddle Quere dore; and in either wall three lyghts and lavatoris (=piscinae) in aither side of the wall, which shall serve for four Auters, that is to say, oon on aither side of the middel dore of the said Quere; and oon on either said of the said isles.

And in eche of the said Isles shal be five Arches abof (i.e. east of) the Stepill, and abof every Arche a Wyndow, and every Wyndow of four lyghts, accordyng in all points to the Wyndows of ther clere-story of the said Quere. And either of the said Isles shall have six mighty Arches butting on aither side to the clere-story, and two mighty Arches butting on aither side to the said Stepull, accordyng to the Arches of the said Quere, both yn table stones (=string-courses) and crestis, with a Sperware embattailment there-upon.

And in the North side of the Chirche the wa said Will. Horwode shall make a Porche, the owter side of clene Asheler, the inner-side of rough stone, containing in length xij fete, and in brede as the botrasse of the said Body wol soeffre, and in hight accordyng to the isle of the same side, with resorable lights in aither side, and with a square embattailment above.

And in the South-side of the Cloystre-ward another Porche joyning to the Dore of the said Cloystre, beryng wydenesse as the botrasse will soeffre, and in hight betwixt the Chirch and the said . . . Dore, with a Dore yn the West-side of the said Porche to the Town-ward; and in aither side so many lights as will suffice, and a square embattailment above, and in hight accordyng to the place where hit is set.

And in the West-end of the said body shall be a Stepyl standing (within) the Chirche upon three strong and mighty Arches (and) vawthid with stoon; the which Steepil shall haf in length xxiiij fete after the mete-yard, three fete to the yard above the ground-table-stones, and xx fete square wittyn the walls, the Walles beryng six foot thicknesse abof the said ground-table-stones. And to the hight of the said body hit shall be square with two mighty botresses joyning there-to, oon in aither side of a large Dore, which shall be in the West end of the same Stepill. And abof the Dore of the said Stepill a wyndow rising in hight also high as the gret Arche of the Stepill, and in brede as the body will issue. And in the said Stepill shall be two flores, and abof either flore viij clere-storial windows set in the myddes of the walle,

che window of three lights, and alle the owtter side of the Stepill of clen wrought Free-stone; and the inner side of rough ston. And in the said Stepill shall be a vice townyng, serving till the said Body, Isles and Quere, both beneth and abof, with alle manere other werke necessary that longhyth to such a Body, Isles, Stepill, and Porches, also well nought comprehendit in this Endenture, is comprehendit and expressyd.

And of all the werke that in thise same Endenture is devised and rehersed my said Lord of Yorke shall fynde the carryage and stuffe, that ys to say, Stone, Lyme, Sonde, Ropes, Boltes, Ladderis, Tymbre, Scaffolds, Gynnes, and all mannere of Stuffe that longeth to the said werke; for the which werke well, truly, and duly to be made and fynisht in wyse as it ys afore devised and declaryd, the said Will. Horwode shall haf of my said Lord ccc. (£300) Sterlingues: of the which summe he shall be payd in wyse as it shall be declared hereafter; that is to say when he hath takyn his ground of the said Kirke, Isles, Botrasse, Porches, and Stepill, hewyn and set his ground-table-stones, and his ligements (=base-mouldings), and the wall thereto withyn and without, as hit ought to be well and duly made, then he shall haf vii. li. xiijs. iiijd. (£6 13s. 4d.). And when the said Will. Horwode hath set oon fote abof the ground-table-stone, also well throughout the outerside as the inner side of all the said werke; then he shall haf payment of an c.l. (£100) sterling, and so for every fote of the seid werke, affir that hit be fully wroght and set, as hit ought to be, and as it is afore devysed, till it come to the full hight of the highest of the fynials, and batailment of the seyd body, hewyng, setting and reysing . . . of the Steple, after hit be passyd the highest of the Embattailment of the sayd Body, he shall but xxxs. Sterlingues, till hit be fully endyd and performed, in wise as hit is afore devysed.

And when all the werk abof written, rehersed, and devised is fully finisht, as hit ought to be, and hit is above accordyd and devysed betwix the seyd Commissaris, and the sayd William; then the seyd Will. Horwode shall haf full payment of the said ccc.l. Sterling, if any be due, or left unpaid thereof until hym. And during all the sayd werke the seyd Will. Horwode shall neither set mo nor fewer Freemasons, Rogh Setters, ne Levers thereupon, but as such as shall be ordeigned to haf the governance and ofersight of the said werke undre my Lord of Yorke well ordeign him, and assigne him for to haf.

And yf so be, that the seyd Will. Horwode mak not full payment of all or any of his workmen, then the Clerke of Werke shall pay him in his presence and stoppe als mykyll in the said Will. Horwode hand, as the payment that shall be dewe unto the Workmen comyth to.

And during all the seyd Werke the Setters shall be chosyn and takyn by such as shall haf the governance and oversight of the sayd werke by my seyd Lord; they to be payed by the hand of the sayd Will. Horwode, in forme and manner abof wryten and devysed. And yf be so that the sayd Will. Horwode wol complayn and say at any time that the two Setters, or any of them be not profitable ne suffisant Workmen for my Lordy's avayle; then by oversight of Master-Masons of the Countre they shall be demyd; and yf they be found faulty, or unable then they shall be chaunghyt, and other takyn and chosen in, by such as shall haf the governance of the sayd Werke by my sayd Lordy's ordenance and commandment.

And yf hit so be that the sayd Will. Horwode make nought full end of the said Werke withyn terme reasonable, which shall be lymit him in certain by my said Lord, or by his Counseil in forme and manere as is aforewritten and devused in these same Endentures, then he shall yeilde his Body to Prison at my Lordy's Will, and all his movable goods and heritages at my sayd Lordy's disposition or ordenance.

The contract seems to have been most faithfully carried out as the various parts are still almost exactly as described. The fact that William Horwode is described as a Freemason only means that he was a master man building on his own account wherever anyone wanted a church erected. The church, said Mr. Hope, compares in a very simple way with that at Windsor; it is now extremely plain, and no doubt derived much of its glory from the stained glass and the furniture. It is impossible to find details of the now vanished quire or its Lady chapel, as the site is now used as the churchyard. The quire stalls after the suppression of the college and the consequent decay of the quire are said to have been distributed in some of the neighbouring churches. In the chancel are two handsome monuments erected by Queen Elizabeth to shelter the bones of the founder

and his nephew, Richard Duke of York (A.D. 1460), father of Edward IV., whose neglected tombs she found in the roofless quire. The pulpit is a charmingly carved piece of fifteenth century work, which was given by Edward IV. The square tower is crowned with a tall octagon. Seen from the outside the church shows a preponderance of voids over solids. Close to the church is the field where once stood

FOTHERINGHAY CASTLE.

All that remains at Fotheringhay of this building is a shapeless mass of rubble masonry. Sheep and cows peacefully graze on the site of the great hall, where on February 8, 1586-87, Queen Mary was beheaded after five months rigorous imprisonment. At the foot of the great mount, first thrown up to command the Nene against the incursions of the Danes, grow thistles, locally known as "Queen Mary's Tears." The sole occasion on which the castle figured conspicuously was the grim one already mentioned. Up to 1215 the defences were all of wood. Upon the mount was set no doubt a wooden tower or citadel, approached by a flight of steps from the surrounding ditch, and encircled by a timber platform, while the banks which protected the attached courts or baileys were crested with stout wooden palisades. It was erected according to the ordinary mount-and-bailey plan of an early Norman castle by Simon of Senlis, Earl of Northampton, in the second half of the twelfth century. The mount stands at the south-west end of the bailey close to the river, and as usual had its own ditch, intersecting at two points with the ditch of the bailey. About the end of the fourteenth century the castle is said to have been rebuilt by Edmund of Langley, the tower being in the form of a fetterlock which was the family badge of the Dukes of York. It became the principal and favourite residence of the Plantagenets of York. Some two hundred years later it was given as a portion of the dowry of Catherine of Aragon on her marriage to Prince Arthur, and she, according to Leland, "did great costs of refreshing it." The castle was dismantled after 1625, and must have long been a rare quarry to building owners and contractors for miles around. The process of obliteration could hardly have been more complete. It is almost pitiful to hear that that sole remaining mass of rubble may soon be fenced in by zealous admirers of Queen Mary.

Mr. Hope said that a number of misguided people had subscribed money to put a railing round this piece of rubble. He described the proposal as the most preposterous thing he had ever heard, and said they would all wish the horrible thing away. A much better method of spending the money would be to set someone to dig for the foundations, and so ascertain the precise lay-out of the various buildings.

From this melancholy spot a move was made to

TANSOR CHURCH.

The exterior of this building gives little indication of the delight which awaits the visitor within. From the point of view of development of plan it is of the utmost interest. It began as an aisleless early twelfth-century church. About fifty years later aisles and a west tower were added. Early in the thirteenth century the north aisle was extended eastward, with a small vestry at its east end, to as far as the east wall of the chancel. The south aisle was also lengthened to a similar extent. Owing to the narrow bay formed by the vestry on the north side, the spacing of the north and south arcades is irregular. There are six bays on the north and five on the south side. Then the chancel was carried a short distance eastward, and finally the south aisle widened so as to include a transeptal chapel. A vice, made in the south-east corner of the tower in the thirteenth century, weakened the structure, and accordingly a new arch was built up inside the older arch in the east wall of the tower. Some of the stalls from the destroyed quire of Fotheringhay Church remain in the chancel, and are carved with interesting heraldic badges. The floor has a considerable rise towards the east and north.

Presumably it was questions of commissariat which sent the motor-cars due south to Oundle for luncheon, and immediately after that meal back north again to

WARMINGTON CHURCH.

It is claimed that this church is one of the very finest, if not the finest, church of its period—the Early English. According to Mr. Hamilton Thompson, however, it may have taken about fifty or seventy-five years in building. The arcades of the nave, with their tall arches and slender columns and delicate mouldings, have capitals which seem to belong to the latter part of the twelfth century. Apparently these columns and capitals were incorporated in the almost total rebuilding which took place in the middle of the thirteenth

century, when the chancel, aisles, clerestory, vaulted north and south porches and west tower with spire were erected. To this same period belongs the most peculiar feature of this beautiful church—namely, the ribbed wooden roof of the nave, closely imitating stone vaulting. The tower is full of interesting detail, especially the west doorway, with its trefoil head. Its broach spire has three rows of spire lights, whose gables are of sufficient projection to somewhat mar the outline and detract from the height. Both the chancel screen and the pulpit, which are elaborately coloured, are partly fifteenth century and partly new. There is a notable screen at the east end of the north aisle, combining Gothic and delicate Renaissance details which may possibly be the work of the man who put up the screen at King's College Chapel, Cambridge.

POLEBROOK CHURCH.

So far as the broach spire is concerned, the church at Polebrook might have been intended as a replica of that at Warmington. There, however, the resemblance ceases. The Polebrook plan is fascinatingly irregular, with a short nave and a long chancel, aisles of slightly differing width, and a north transept nearly half as deep again as that on the south. There is not much as old as the twelfth century. As at Warmington, the church owes most of its beauty to the works carried out in the thirteenth century by the lords of the manor, the abbot and convent of Peterborough. The thirteenth-century tower is not, as usual, at the west end of the nave, but adjoins its westernmost bay on the south side. There is an old rood-screen, with some remains of colour, and a plain Jacobean pulpit with an hour-glass in its bracket. The north transept has some curious and charming arcading on the east and west walls.

The programme did not allow much time for viewing this building, and that little was much curtailed by a discussion on a point raised by Sir Henry Howorth (President) as to whether Mr. Hamilton Thompson was justified in his belief that so many of the local eleventh-century village churches had originally a central tower.

OUNDLÉ CHURCH.

"Murray" says that Oundle is one of the pleasantest towns in Northamptonshire, with its broad, clean streets, picturesque oriel windows, and general air of antiquity. No visitor here will be disposed to challenge the claim. Every street appears rich in things to admire and bits to sketch. Unfortunately, time was short, and the programme only allowed for a halt at the Talbot Hotel and the parish church. The former offers both æsthetic and corporeal attractions of no mean order. The building materials are said to have come from Fotheringhay Castle, four miles to the north. It has a splendid staircase (very like that at Lyveden Old Building a few miles away), an excellent room upstairs with a fine fireplace, a picturesque courtyard, a typical gabled Tudor front, and, last but not least, an attractive table. The church is worthy of such a well-to-do town, and of its owners, the monastery of Peterborough. Hardly anything more of the twelfth-century building remains than the four piers which once supported a central tower and the two piers to the east of the crossing. Most of the long and lofty structure belongs to the thirteenth century. The present elaborate tower at the west end dates from towards the end of the following century, and succeeded the demolished central tower, while its tapering spire was apparently rebuilt in 1634, though there is no indication of Classic feeling about it. The vaulted south porch, with an upper chamber, was erected about 1485. The most interesting piece of furniture is the richly coloured fifteenth-century pulpit, which has only been slightly touched-up. There is also a good deal of old work in the screens between the chancel and the side chapels and in the rood screen. The sixteenth-century vestry on the north side of the chancel has an upper storey, which may have been intended either for an anchorite or for a sacristan. There is a large bone-hole beneath the south transept.

Oundle is particularly interesting in ecclesiastical history. St. Wilfrith of Northumbria, Archbishop of York, established a monastery here, and here he died in 709. His body was conveyed to Ripon.

In the evening Mr. Christopher A. Markham, F.S.A., read a paper on "Ancient Roads and Bridges in Northamptonshire."

Wednesday, July 31.

The final day of the Summer Meeting opened with what must be to archæologists the *pièce de résistance* of Northamptonshire—a visit to

BRIXWORTH CHURCH.

This is the most complete example in England of an early church on the basilican plan. Indeed, at one time it used

to be claimed that the present building originally served as a secular basilica. That theory, however, cannot stand the critical investigation which antiquaries now bring to bear upon their studies. But much remains to them, and they are content to know with practical certainty that the greater part of the present building is without doubt of Early Saxon origin, and was probably built about A.D. 680, when a monastery was founded here as an off-shoot of the Saxon abbey at Peterborough. Much Roman brickwork was re-used in the structure, which followed the ground-plan of early basilican churches. It now consists of apse, presbytery with south chapel, nave of four bays (originally aisled) with clerestory, and western tower with spire. The nave was originally divided from the presbytery by a screen-wall pierced by three arches, such as those of which traces are found in the Early Saxon churches of Kent and Essex. The lower part of the western tower was formerly a porch with an upper stage, a tall archway in the western wall, and smaller arches on north and south communicated with adjoining buildings, of which slight traces are left. This porch or fore-building was raised at a later date to form a tower, and a circular stair-turret was built against the west wall, the original archway being blocked up, and a smaller archway inserted. The apse, semicircular internally, but externally polygonal, may also have been reconstructed at this pre-Conquest period. The south doorway of the nave is of the end of the twelfth century. Additions of later periods are the thirteenth-century chapel south of the presbytery and the spire; the belfry stage of the tower was also reconstructed in the fourteenth century. A much debated point is the use of the passage (originally vaulted) which surrounds the foundations of the apse. This passage was entered by doorways in the east wall of the presbytery. Mr. Hamilton Thompson suggested that it probably formed the ambulatory of a crypt beneath the apse, which was filled up when the apse was reconstructed, and that the two shallow wall-recesses were provided as sort of manholes to prevent crushing when pilgrims came to visit the relic in the crypt.

A great debt is owing to a recent vicar, Mr. Watkins, who did much towards bringing to light the true character of this structure. The building seems to have been in a disgraceful state. The *Church Builder*, in a description of the work, said:—"Previous to its restoration the church was one of the most dilapidated and ill-arranged in the whole country. We are accustomed to speak of pews in some churches as pens, as boxes, as drawing-rooms; but, really, in Brixworth Church there were great pews which might almost be called houses, and there are small pews which might be termed hovels."

In the church are a stone reliquary supposed to contain the throat-bone of St. Boniface, a fifteenth-century screen between the chancel and the south chapel, and a thirteenth-century effigy. Brixworth Church was granted in the thirteenth century to the cathedral church of Salisbury, in which it formed a prebend annexed to the dignity of the chancellor.

The tourist may perhaps be pardoned for moralising if he passes from seventh-century Brixworth, which after more than twelve hundred years is still a place for prayer, to

HOLDENBY HOUSE.

Holdenby was one of the largest of the palaces, or palatial hotels, built by aspiring courtiers for the occasional accommodation of Elizabeth and James. It was the work of Sir Christopher Hatton, Elizabeth's Lord Chancellor ("the last and greatest monument of his youth," as he describes it), who in a letter to Sir Thomas Heneage in 1580 says he left his "shrine still unseen, until that holy saint (Queen Elizabeth) may sit in it, to whom it is dedicated." Of the enormous pile nothing remains except two large entrance archways, dumped down in a field, and one side of a court. Fortunately a survey was made of Holdenby in 1587, not long after its completion, and from this an excellent idea can be obtained of the surroundings of the larger Elizabethan houses. Mr. J. A. Gotch, who conducted the party, gives the following account of it in his "Early Renaissance Architecture in England":—"The road between two villages ran along the north side of the park, and from this road branched another one which led up to the house. While it traversed the park it was allowed to wind according to the undulations of the ground, but when it came to within a quarter of a mile of the lodge it was made perfectly straight, and so ran through the midst of 'The Greene'—'a large, long, straight, fair way,' as Lord Burghley called it. It led directly to the porter's lodge, which was a building separate from the house, and self-contained, and it passed the long range of stabling on the right. The porter's

lodge opened into the first court, the 'base-court,' as it was called, walled round and entered on its two sides by large gateways. At the further end of the base court stood the house, raised a few steps above the general level, where Lord Burghley 'found a great magnificence in the front or front pieces of the house, and so every part answerable to other, to allure liking.' The house was built round two great courts, the first 128 feet by 104 feet, the second 140 feet by 110 feet, comparable in point of size to those at Hampton Court, and a good deal more intricate in detail. To the north of the house itself were two walled gardens, of nearly an acre each, and beyond these were spinneys, or small woods, and the little village with its inn." As we have already said practically nothing more than the entrance gateways remain of this once proud dwelling. They bear the date 1583 and suggest foreign influence. As now seen they seem extraordinarily clumsy and arrogant. The house came into the possession of the Crown about 1608, and was one of the places of detention of Charles I. After his death it was sold, and soon afterwards it fell, or was violently hurried, into decay.

HOLDENBY CHURCH.

The most noteworthy feature of this small church is the fine Renaissance screen, said to have been brought from Holdenby House. It must remain a moot point as to whether or no it was designed as an ecclesiastical screen. In the chancel are eight stalls with misericord seats. The south chancel includes several brasses to the Hatton family, whose original manor house was close by.

The party returned to Northampton for lunch. A drive of a mile and a quarter, most of it along a finely timbered road, brought the cars to

EARL'S BARTON.

The great west tower of this building is, of course, known to all as the stock example of Anglo-Saxon work with its "long-and-short" quoins, and bands of strip work on the faces. It was probably built towards the close of the tenth century, and is considered to be contemporary with the lower portions of the towers of Barnack and St. Peter's, Barton-on-Humber. The rest of the church is of post-Conquest dates. Mr. Hamilton Thompson pointed out that the prevalent idea that Saxon ornamental strip-work and its concomitants were derived in the first instance from construction in timber seemed to be quite erroneous. Professor Baldwin Brown, in "The Arts in Early England," shows that at the time when these towers were in course of erection English building had come very much under the influence of Flanders and Germany, and that analogous examples to the strip-work exist in German churches of the same date. Another point to notice at Earl's Barton was that the baluster-shafts dividing the window openings are merely ornamental facings to the solid pieces of wall which form the actual divisions. The present battlemented parapet on the top of the tower is of course a subsequent addition. The wide archway from the tower into the nave was made late in the thirteenth century with a careful re-use of twelfth-century material. At that time the whole body of the church underwent considerable alteration, as again happened in the fourteenth century.

Mr. St. John Hope, in speaking of the strip-work, said that some time ago his attention had been called to some paintings discovered in North Africa, which showed Roman pilgrims in front of buildings which were ornamented in precisely the same way as this Saxon tower. It had to be remembered that when the Saxons came to England they brought no building tradition with them. In building their stone churches they used Roman materials and used them on the Roman model. So it is not to Germany that we must look for the prototypes.

Not far from Earl's Barton is one of the principal show places of the county, viz.

CASTLE ASHBY.

Every vestige of the mediæval castle which once stood here has now disappeared. The existing large mansion was commenced by Henry Lord Compton about 1585, and was finished in 1624. The bulk of this imposing house is of the Elizabethan type with mullioned windows. The south front is said to have been designed by Inigo Jones. The interior has undergone much renovation and, unlike some other Northamptonshire houses, arouses no misgiving as to the ability of the aristocratic owners to keep it up. The gardens and lay-out have always been noteworthy. A map of 1760 shows a fine avenue leading from each of the fronts. Shortly after this date great changes were commenced by "Capability" Brown; but his work was stopped owing to

the enormous expense of the Parliamentary election for the borough of Northampton in 1768. In that year Lords Halifax, Northampton, and Spencer each nominated their own candidate, and are said to have actually expended no less than £400,000. The election was referred to the House of Commons, and had finally to be decided by the toss of a coin. Lord Northampton was beggared by his outlay of £150,000, and had to cut down his trees, sell his furniture at Compton Wynyates, and spend the rest of his life on the Continent. A conspicuous feature of this splendid house is the lettered stone balustrade round the top of its four sides, forming the text "Nisi Dominus ædificaverit," &c.

The final visit on this very rainy day was to

COGENHOE.

The church of Cogenhoe, as we have it now, dates, according to Mr. Serjeantson, mainly from the thirteenth and fourteenth centuries. There are, however, small portions of an earlier church still remaining. The chancel was rebuilt about the year 1225. An interesting feature of it is the beautiful arcading which runs along the north and south walls. Within the arcades on the south side are pairs of ancient lights; on the north there are only two arcade arches; in the middle of this wall is an interesting Easter Sepulchre above two aumbries. During the third quarter of the thirteenth century the nave was rebuilt, doubtless by Nicholas de Cogenhoe, whose family had held the manor since the time of Henry II. His arms occur four times on the capitals of the nave arcade. He also built the north chancel chapel; the permits are still existing authorising him to have from the royal forests five oaks fit for timber, and a further four oaks which were probably required for this purpose. Nicholas was evidently a favourite with Edward I., who in 1275 granted him three tuns of the royal wine with which his son might keep the feast of his inception as Master of Arts at Oxford. Three years later the King granted Nicholas a tun of the royal wine for his own use. Later the Keeper of Northampton Park was ordered to send to him twelve live hares for the stocking of his grove. In 1345 the Coroner's Rolls for Northamptonshire record the case of a fugitive taking sanctuary in this church. A certain Ralph Caponn robbed a man of 10s. in the wood of Harpole, and for fear of arrest took sanctuary in the neighbouring church of Ecton. He confessed his crime to the Coroner two days later, but was unwilling to abjure the realm. He stayed in the building thirty days before he managed to escape, but the hue and cry was soon raised, and he was glad to take sanctuary in the church of Cogenhoe; there he again confessed his crime, abjured the realm, and was despatched to Dover. Among the interesting things inside the church are the effigy of Nicholas de Cogenhoe in full chain armour (1281), a map of the parish drawn up in 1630 for Mr. Francis Cheney, and more especially the quaint and vigorous heads carved on the nave capitals and about the church. In the porch is a holy water stoup of late fifteenth or early sixteenth century date. On the east gable is a beautifully sculptured stone cross, carved on all four sides. It bears representations of the Holy Trinity, the Crucifixion, St. Peter, and St. Paul.

ILLUSTRATIONS.

CARVED SPANDRIL, STONE CHURCH, KENT.

This church, erected about 1245, is one of the best examples of Early English work, and has been considered, by good authority, to have been designed by the architect of Westminster Abbey. Its ornament shows that skill and taste that prevailed among the freemasons at that period, such as can be seen in York Minster, Wells Cathedral, &c., and the drawing (from a cast) shows the finest example of carved foliage of that period that exists. It shows the spandril of the arcade with conventional foliage, a striking feature of which is that the stalk is always present, the object being that the foliage should seem to grow out of the shaft as naturally as the branches grow out of a tree trunk. The drawing reproduced was awarded a prize in the monthly competition of *The Architect Students' Sketching and Measuring Club*.

COMPETITION DESIGNS FOR NEW HEAD OFFICES OF THE PORT OF LONDON AUTHORITY.

We this week illustrate the design submitted in the preliminary competition by Messrs. G. Berkeley Wills, A.R.I.B.A., & Cecil Burns, and also that sent in by Messrs. P. Hubert Keys, A.R.I.B.A., & F. Dowdeswell, A.R.I.B.A.

INTERIOR DECORATION.—III.

GREAT BRITAIN.—I.—TRANSITIONAL PERIOD — RENAISSANCE.

By ALBERT E. BULLOCK, A.R.I.B.A.

(Continued from last week.)

THE ceilings of Layer Marney Hall, Essex; Holnaker Manor House, Sussex, and Prebendal House, Exeter (now demolished) are all of wood construction. A combination of wood and plaster exists at Tolleshunt d'Arcy Hall, Essex, and Holcombe Court, Devon.

One of the earliest dated ceilings in London is that of the Chapel Royal, St. James's Palace, which was executed by Hans Holbein in 1540, three years prior to his decease. Mr. C. J. Richardson made a fine coloured drawing of this ceiling, now in the collection at the Victoria and Albert Museum, containing the Latin motto: STET DIEV FELIX: HENRIC. 9 REX. 8—HÆA VIVAT REX. 1540. DIEU ET. MO.—DROIT, &c.

It is one of the earliest examples of coloured ceilings in which wood ribs are used with mitred angles having plaster or papier-maché panels. There are many emblems, the arms being emblazoned in their proper colours. The subject is gilt, and shaded boldly with bistre; the roses glazed with red, the leaves dark green, and the general ground light blue. The mouldings are painted green, and some are gilt. The underside is dark blue, on which is a small open running ornament cast in lead and gilt.

In the Additional MSS. British Museum (5308) there are jewellery designs by Hans Holbein, but little of his other decorative work remains.

There existed a good Elizabethan house in Gravel Lane, Houndsditch, said to have been inhabited by Count Gondomer, the Spanish Ambassador to Queen Elizabeth. Additions were made during the reign of James I. by Robert Shaw, of Southwark, an Alderman and Master of the Vintners' Company, who caused his arms to be put on the ceiling.

Exeter, famous for its ancient work (much of which is now, however, dismantled), contains a building in the Mint, off Fore Street, called St. Nicholas Priory, said to be named after Nicholas, Archbishop of Myra, the capital of Lycia, in Asia Minor, who died A.D. 342. The Priory was founded after the Conquest; the particular Order does not appear to be known. A monk of the name of Gunterus was first Prior, the last being William Cullompton, who was installed in 1523, after which date the early geometrical plaster ceiling would appear to have been formed, and possibly before 1536, when the establishment was suppressed by the Act of Henry VIII. When the buildings came into the hands of the City Council most of the monastery was destroyed for building bridges and other works. The remaining buildings have recently been purchased by the Corporation, and are to be restored and used as the City Museum.

There was at this time a short-lived introduction of renaissance work in Scotland under the auspices of the Royal architect, Sir James Hamilton, the natural son of the Earl of Arran, who went to the Court of Francis I., married a French lady, and came back to rebuild, inter alia, Stirling Castle.

Although he was executed for treason in 1540 Hamilton managed to leave an impression on several buildings, as Falkland Castle and other examples, which subject was recently dealt with by Mr. Laurence Weaver in a lecture given to the Architectural Association, Tufton Street, entitled, "Some Scottish Houses of the Renaissance," from which it appears that very little further renaissance work was executed in Scotland until the advent of Sir William Bruce, except for the work of Inigo Jones, Nicholas Stone, and Matthew Goodricke at Holyrood Palace in 1617, when preparations were made for James I.'s visit.

The hall screen was retained in the planning of the mansion during early renaissance times, and formed an attractive object for the wood-carver. The screen at the Charterhouse, London, is said to be as early as 1537, while the screen at Audley End would be a much later example, as the building was commenced in 1603 and finished by John Thorpe and Bernard Jannsens in 1616.

There is an interesting church screen at St. Mary's, Crocombe, of late fifteenth-century work, which exhibits the typical cresting so familiar a feature upon Elizabethan altar tombs.

Very few names of Elizabethan architects have been handed down to posterity, and in some cases there is considerable vagueness as to the part they played in the erection of the many buildings of which we have record. The first of any importance is John of Padua, who obtained Royal

grants for executing work in 1544 and 1549; then comes the name of Robert Smithson, who was born in 1535, the architect of Wollaton and Hardwick Halls; his son, Huntingdon Smithson, who died in 1648; John Smithson, the son of the last mentioned; and John Thorpe. The latter is perhaps the greatest enigma, and his book of drawings in the Soane Museum is the subject of the shedding of much ink, on account of the conflicting dates mentioned, ranging from 1502 to past 1600. It seems, however, pretty clear that he was more of a surveyor than an architect, and that his part was chiefly to visit the buildings of the nobility and make small additions, except towards the latter years of his life, when he states he laid the first stone of Kirby Hall in Northamptonshire in 1570, the seat of Sir Humphrey Stafford; his additions to Ampthill and his connection with Jannsens at Audley End (or Audley's Inn, which Mr. Laurence Turner considers to be the origin of the title). Thorpe built several smaller residences, such as Longford Castle, 1580, near Salisbury (for Sir Thomas Gorges), which has a triangular plan with circular towers at each apex, the exterior of which is of later date and of bad German type of design, while the interior has been much altered. The panelling in a room in one of the circular towers was painted white with gilt mouldings. The house was once in the possession of Lord Folkestone. Theobalds and Holdenby are also said to be from Thorpe's designs.

He appears to have paid a visit to France in 1600, and to have altered a house in the Faubourg St. Germain, possibly the Luxemburg, when he also seems to have visited the Palace of St. Germain from the note on a plan, "St. Jermins house v. leagues from Paris—1600."

In 1563 was published "The First and Chief Groundes of Architecture," by "Jhon Shute, Paynter and Archytecte."

The last half of the century saw the building of a considerable number of important residences, such as Burghley House, 1553; Morton Old Hall, Cheshire, 1559; Loseley in Surrey, 1562; the Old Hall, Heath, Yorkshire, 1564 (the year of Shakespeare's birth), the Jezebel chimney-piece being a later addition, circa 1620; Longleat (now demolished) in Wiltshire, 1566-78; Buckhurst, Sussex, 1568, for Thomas Sackville, Lord Buckhurst; and Gorhambury, Herts, the same year. Hardwick Hall was in progress from 1567-79, built for Elizabeth, Countess of Shrewsbury.

In the presence chamber at Hardwick there is a deep frieze in painted plaster representing Diana and her nymphs in a forest with hunting subjects, beneath which are hung Flemish tapestries of the sixteenth century. The canopy is modern. The house was designed by Robert Smithson, who was occupied with Wollaton Hall, Nottinghamshire, from 1580-8. He died in 1614. (Mr. Gotch says 1634, but this does not coincide with the description given by Mr. Maurice B. Adams in the R.I.B.A. Journal, March 23, 1907.) His son, Huntingdon Smithson, was sent to Italy by Sir Charles Cavendish, who rebuilt Bolsover in 1613.

Buckhurst Park occupied Thorpe's attentions some time before 1570, the plan being of the central court type, and having a wide terrace running the whole length of the west side. The manor-house was the seat of Sir John Sackville, whose son Richard succeeded him. Thomas Sackville, the first Earl of Dorset, caused the alterations to be made by Thorpe, but lived the latter years of his life till 1608 at Knowle. The house has seen many subsequent changes—namely, in 1739 and in 1830, when Repton rebuilt the greater portion for George John Sackville-West. In more recent years additions to the house and gardens have been made under the sympathetic hands of Mr. Edwin Lutyens for the present owner, Mr. R. H. Benson.

Ampthill was erected in the reign of Henry IV. for Sir J. Cornwall, who died in 1443, and was enlarged by John Thorpe about 1576, probably after he had completed Kirby Hall.

Burleigh House, built for Sir Francis Willoughby, and Theobalds for Sir William Cecil, Lord Burghley, are also the works of John Thorpe. The latter was exchanged by Sir Robert Cecil for Hatfield in 1607 with James I., who died at Theobalds in 1625. The designer of Hatfield House was Robert Limmings, who built Blickling Hall about 1620.

Thorpe was engaged on Holdenby in 1580, the year of the commencement of the works of Montacute, Somerset, which latter has an extraordinarily rich painted treatment to the panelled work, especially the doors of the great hall. The

* This book, of which only five original copies appear to be extant, has recently been reprinted by *Country Life*, with an introduction by Mr. Laurence Weaver.

large chimney-piece is dated 1599, and is a very elaborately carved work.

In 1585 Middleburgh was erected by Robert Adams, an architect and engraver, who does not appear to be very well known. He was born in 1540 and died in 1591.

Westwood Park, Worcestershire, still retains its Elizabethan character, although added to considerably in the following reign. The entrance lodge is a picturesque feature, and the sculptured arms over the entrance arcading is very decoratively treated. The interior contains much well preserved panelled work and some fine Jacobean chimney-pieces and ceilings.

Additions were made to Coombe Abbey about 1589, the estate of Lord Harrington, who was tutor to Princess Elizabeth until 1613.

Beaufort House, Chelsea, was built on the site of Sir Thomas More's residence for Sir Robert Cecil in 1590. The archway which Nicholas Stone erected here in James's reign has been removed to Lord Burlington's villa at Chiswick.

The best-preserved example of Elizabethan work at Exeter is that of the residence of Sir Amyas Bampfylde (Lord Poltimore), which is now in the possession of Messrs. Varwell, Guest & Co., Ltd., who have restored the work. It is a stone-built house of channel shaped plan, having the entrance porch in an internal angle. On the first floor is a fine oak panelled room with a well carved chimney-piece, the overmantel of which contains the Bampfylde coat of arms picked out in colours and gilt. There are two ceilings of the period in a good state of preservation. The windows contain the original stained glass, and incidentally there is preserved in the courtyard a fine lead cistern bearing the date 1727.

Astley Hall, Lancashire, dates about the time the long gallery was added to Powis Castle (1592), which latter has a very curious ceiling and unusual wainscoting with fielded panels. The work is somewhat clumsy in comparison with other current examples, especially the frieze. The ceiling ribs will be noticed in the photograph to interlace alternately along the soffite. The coats of arms and dwarf Ionic columns are emphasised by darker colouring. The panelling in the other photograph here given exhibits a higher grade of finish and is probably later, although there are similar motifs in the ceiling decoration.

The Admiral's Room, Old Mol's Coffee Tavern, in the Close, Exeter, now occupied by Messrs. Worth's Galleries, and the rooms at the *Devon and Exeter Gazette* office, Exeter, would date about this time. The latter example was originally part of the residence of Roger Mallock who was mayor in 1636; the chimney-pieces are chiefly carved and the ceilings of light pattern with applied ornament. A pair of folding doors from the back ground floor room are now in the Victoria and Albert Museum, South Kensington, and like the other small door giving access to the room, they have inlaid veneered panelling. This latter mentioned door has a masonic mark on the carving of the door head.

(To be continued.)

ON THE MODIFICATION OF MODEL BUILDING BY-LAWS.*

I SHALL concern myself mainly with those by-laws that affect building in the country, leaving the vexed matters of road construction and their proper widths as ones rather for the surveyors to deal with.

By-laws are not enacted to check building, but to secure good building. It is a matter of common knowledge that they have failed to secure the latter.

In the country, except for the matter of sewage disposal and the protection of the water supply, one might argue that no building by-laws are requisite.

However, the Local Government Board does not take this view, and has promulgated a series of Model By-laws for rural districts, which are in force throughout nearly half the country: laws which, when once adopted, the District Councils are powerless to abrogate, and which the Local Government Board declines to modify to suit individual requirements. Moreover, the Board enjoins on such local Councils as may be desirous of having building by-laws a further embroidery of restrictions, specifications and demands, till the original purpose of the Model By-laws is quite overlaid by the numberless provisions and safeguards, appropriate for the most part to urban requirements, or to districts that are in the process of becoming urban. And

the local Councils are eager to meet this demand from the Local Government Board, on the ground that it relieves them and their district surveyor from a great deal of responsibility. This anodyne to the conscience is illusive; the enforcing of regulations to their logical extremities, regardless of the local conditions and requirements, results in harshness and absurdities.

Meanwhile, under our present arrangement of local by-laws enforced by our County Councils, a system has grown up of unnecessarily costly building: this, as a vested interest, the Councils are naturally anxious to preserve. Under their own by-laws they have been penalised in their own efforts; they have been made to conform, regardless of suitability, to their own regulations; they have subscribed painfully to a costly ideal of building, and they do not want the competition of a cheaper form of house. That anybody should be enabled to build, subject to sanitary safeguards, but without restriction as regards construction, would appear to them as an intolerable surrender of the restrictions under which they have worked and to which they have submitted.

There is, as I have said, practically no appeal from the decisions of the County Councils. Literally it might appear to be possible, but no individual, at any rate, would be prepared to devote the time and the money to carry up the appeal to the Local Government Board. Their decisions then are virtually final, and confined within the four corners of their by-laws. But these Councils are not agreed as to what they consider to be the principles of health and construction. They are required to define, for example, the minimum height of rooms, and for rooms on the ground floor there is a consensus of opinion that they should be at least 8 feet high. But when you come to rooms in the roof, or partially in the roof, some Councils require that the room shall nowhere be less than 5 feet in height, and 8 feet to the extent of half the superficial area of the floor; whilst others (such as Godalming) are content with 7 feet in height from floor to ceiling to the extent of two-thirds the area of the floor, with a minimum of 4 feet at the sides. On the other hand, Midhurst, for example (in the by-laws dated 1895), requires the ground floor rooms to be 8 feet 6 inches high, the bedrooms 8 feet 6 inches, and the rooms partially or wholly in the roof to be 9 feet for two-thirds the superficial area of the floor. Some Councils seem to insist on the ground floors having boarded floors on joists; others permit what is generally the more satisfactory method of having a concrete floor to which the boards are nailed direct, although this is not contemplated by the Model By-laws.

The provision for space around cottages is shockingly inadequate; it is not nearly sufficient for the disposal of the refuse of the house. It is a minimum that possibly has to be accepted in a congested town, but can never be excusable in a rural district.

The Model By-laws require that "every person who shall erect a new domestic building shall construct in every habitable room" one or more windows, the sum of which shall be equal to one-tenth of the floor area, and that one-half at least "of such window" made to open. This regulation appears to be accepted by all the various local Councils who have adopted by-laws, without question, and also, I think, without due consideration. Adequate light is, of course, essential to every habitable room, but regard must be given to the source of light available for such purpose. No general statement or regulation can meet the case, and to fix a minimum of one-tenth the floor area is absurd. At most you can only say in general terms that ground floor rooms require larger window area than first floor rooms, since their outlook is generally more obstructed by foreground objects; and that not more window area should be provided than is requisite, since windows make the rooms hot in summer and cold in winter, any excess of which is prejudicial to their occupants.

The Model By-laws decline to differentiate between an earth-closet and a privy. The local Councils, as a rule, make the distinction. Some allow an earth-closet within the house; some forbid, and stipulate that it shall be at least 10 feet away. Now, whilst this might in some cases be a valuable precaution to take in poor cottage property, it is an extremely arbitrary interference in the case of superior buildings, for there is no question that a properly managed earth system is more sanitary than a water-borne one.

Again, wastes from baths and sinks are far better dealt with above ground, than being made to travel through pipes to a cesspool, which is to be constructed according to the Model By-laws to be "impervious to liquid." In other words, you arrange a costly system of traps, pipes, and receptacle to enable you to keep your sewage until it is putrid, and then in that state have to bale it out on the

* Abstract of Paper by Mr. Halsey Ricardo, F.R.I.B.A., read at the York Congress of the Royal Sanitary Institute.

ground; whereas, if it is to go there, it is better to put it there before it goes bad. The truth is, we waste too much water in our present sewage arrangements, and where especially, the amount of ground is limited, we ought to use the dry-earth system more. And to meet the objection that this system is so often abused, I would advocate that all country village schools should be provided with earth-closets, and that it should be part of the curriculum of school teaching that the children should be taught how to use those closets, how to keep them sweet and clean, how to deal with the charged soil in the school gardens, and the why and wherefore of the whole matter. A neglected earth-closet is a repulsive affair, and there is a specious cleanliness in a flush of water down a pan, but the price paid for this panacea is a heavy one. The provision of a water supply, with its pipes liable to burst in frosty weather, its flushing cisterns not always in working order, traps, ventilation, and anti-syphonage pipes, its underground drain pipes, and the evil insanitary cesspool are all heavy items to put to the other side of the account.

The Model By-laws are wise in insisting on dry walls, and leaving the builder in other respects unfettered as to size, material, position, strength, &c. But the county councils, in their local by-laws, have refined on this and have gone into great particularity in their requirements and specifications on all those heads. Their regulations ignore, or boycott, local methods and tradition; they refuse to permit timber construction and, apparently, the erection of mud or clunch walls, and they rule thatch out of court as a roof covering. Now, timber construction, in some districts, is a very proper and convenient method of building a house: it can be made perfectly snug and weathertight; it is sufficiently durable and the danger to life from fire is not really a serious one, or really greater than the flimsy erections, permissible under the Model By-laws, of so-called incombustible materials. The same can be said of thatch. As a roof covering it is far superior to slates in respect of comfort: since it keeps the house warm in winter and cool in summer, and one's own experience is that it is rare for a thatched roof to be set on fire. This condition of things is ignored by the local by-laws, and one of the consequences is that the making of mud or chalk walls and the proper thatching of a roof is becoming a lost art, an art too good to lose. Even on the hayrick it is gradually disappearing, since ricks are being heaped under permanent structures with corrugated iron roofs.

I suppose it is a vain thing to ask the county councils to discourage the use of hollow walls above ground. I consider them a faulty construction, leading to all sorts of subsequent disasters. Their sole excuse, that I know of, is that the outer skin, being separated by a cavity from the inner, protects the latter in case of severe stress of weather from the rain and damp. This is valid in theory, but the theory is largely stultified in general practice. The by-laws should insist on two damp courses where hollow walls are being used, one at the bottom of the cavity, and one to the inner wall some three inches above this wide damp course, otherwise the wet passing through the outer skin collects at the bottom and is sucked up by the inner skin. Not only ought there to be this second damp course, but there should also be a cement or damp-proof rendering made, weathered to a sharp slope, so that the water that has penetrated into the cavity runs at once away from the inner wall and accumulates against the outer; without this precaution, the hollow system is no remedy against damp walls.

But it is far better, and not much more expensive, to build the walls solid, and jacket them with a waterproof outer coat of cement stucco or rough cast. The evils of hollow walls are many. You have a space, if unventilated, full of damp air, in which the ends of your timbers are rotting away. Seeing that your floor joists rest probably on a wood plate (tarred or sanded hoop iron meet this difficulty better) when this decays, the ends of the joists, also partially decayed, drop down some three inches or more on to the brickwork. If the space is ventilated, it becomes the sanctuary and playground for vermin. This open space, under any conditions, is a conductor of sound throughout the building. The system is bad in construction because the main weight of the roof and the floors comes on the inner wall, which in consequence settles down at a different ratio to the outer, almost unweighted, wall. If the ties are of iron (and even when galvanised they rust under their unfavourable conditions), they meet the strain by bending, and such water as lodges on them drains in consequence towards the inner wall; if the ties are made of stoneware or terra cotta,

not being able to bend, they get fractured. I do not know the reason, but there seems to be a general agreement that the cavity must not exceed two-and-a-half inches. It would be just as easy to build the walls with a five-inch cavity, and less chance of the effect of the void being neutralised by chance lumps of mortar resting on the ties and bridging over the cavity. Moreover, pipes, waste and others, have a way of going wrong as they pass from inner to outer walls, and the hollow space has been known to get filled with foul water and sewage, and as the warmer air of the rooms, and the open fires, act as a pump, the bulk of these effluents were sucked into the inner wall.

If the councils are going to insist on minutiae of construction, as they do when they specify the scantlings of roof timbers and floor joists, and their distance away from smoke flues, they should carry their insistence still further: they should require that the walls over the mantelpiece and at the sides of the chimney breasts should be nine inches thick where the flues occur; that the external faces of the chimney stacks, where they emerge from the roof, should be at least nine inches thick; that all skirtings should preferably be in cement, and where the question of cost may render this impracticable, the plaster must be carried down behind the wooden skirtings flush with their backs. In the usual building methods, the space left affords a run for vermin, and in case of fire adds materially to its power of spreading, where plastered wood partitions occur. This open communication between two rooms, or passages and rooms, carries the fire from one part to the other, and feeds it with the necessary air supply. The councils' by-laws generally specify the scantlings of the roof rafters and floor joists, in several cases regardless of what the nature of the wood to be used may be. It would be better, if they must be so particular, to content themselves with specifying the sectional area: but why do so at all? As it is, by prescribing the minimum (which is really too little for inferior timber) the by-laws set a kind of standard, both in masonry and carpentry, so that any architect who exceeds the minimum is held by his client to have committed an extravagance.

On the other hand, by insisting on footings to every wall, where concrete foundations are supplied, they create in many cases an expensive obstruction of no constructional value. If the concrete is thick enough, the walls may just as well rise from it their natural thickness, and it is often cheaper to build the walls in concrete, below the ground level, than in masonry or brickwork. The footings take up a lot of valuable floor space, and are a permanent nuisance. My conclusion then is that, though the Model By-laws issued by the Local Government Board for rural districts require amending in the article of window area, and bringing up to date in the matter of its provisions for the drainage and sanitation of buildings, they are in the main sufficient; and if they had been accepted by the county councils without any glossary, there would not have been this dissatisfaction and outcry. It is true it would have made the position of the district surveyor more responsible, but their relief from responsibility is not a wholesome element, and it leads in many cases to hardship and absurdities. And with all these doctrinaire prescriptions and restrictions, shoddy buildings are being erected all over the country, which, I believe, would be at most impossible if the surveyors had a freer hand in their examination of the plans submitted for proposed buildings.

There is a proposal at this moment before Parliament that a person or persons should be able to appeal to the Local Government Board for special relaxation of the stringency of local by-laws, and the Government are giving the matter their attention.

The temporary housing of a suddenly increased population in a rural district, owing to some large estate developments (road and bridge engineering, extensive buildings and the like) where the influx of workmen is for a time merely, and their houses (at least not all of them) are not required after their withdrawal, has not been considered by the Model By-laws, nor to my knowledge by the county councils' by-laws. But that some form of temporary construction should be permissible is obvious, seeing that with the increased facilities of travel of late years labour may be regarded as more fluid than formerly. The question of providing housing for transitory labour has become an important one, and the problem of erecting cheap temporary buildings, both dry and sanitary, has an especial interest.

It is possible, by asking for too much in the way of requirements, not only to hinder building (the last thing we desire) but also to bring about a neglect of sanitary laws,

by evasion and the lack of the support of public opinion, and this is especially the case where the evils are supposed to be merely temporary and, so to speak, accidental.

Mr. H. D. Searles-Wood, F.R.I.B.A., communicated the following notes on the paper:—The Model By-laws issued by the Local Government Board for use in rural districts only deal with (a) structure of walls and foundations for the purposes of health, and not of stability, and (b) sanitary matters. Even if the by-laws had not secured good buildings they had checked bad buildings, and this was their main object. There are no fire-prevention clauses in the rural Model By-laws. The Public Health Act has a far wider scope than the author indicates, and in the matter of streets and buildings the principal object is to protect the public. District Councils are not powerless to abrogate their by-laws. The Local Government Board does not decline to modify by-laws to suit individual requirements, as seen in the circular letter of January 5, 1906. The Local Government Board do not enjoin unnecessary restrictions, specifications, and demands on local authorities. With regard to the statement that "the local Councils are eager to meet this demand from the Local Government Board," there is no demand from the Local Government Board. County Councils have no power to make by-laws. There are no restrictions as regards construction in rural Model By-laws. There is no power of appeal to the Local Government Board, and the Local Government Board have no power to give a decision. A magistrate's decision is final unless carried to a higher Court. The Local Government Board are, however, very frequently appealed to, and have secured modification in numerous cases in consequence. Councils are not required to define minimum height of rooms; it is purely optional. The clauses relating to height of rooms in the Midhurst by-laws were repealed in 1902, and another by-law substituted requiring 8 feet and 9 feet for superficial area of floor. Solid floors are provided for in Model By-laws. It would be inconsistent for "purposes of health" to require a larger area of space round cottages in rural than in any other district. The fault, if any, is in the Act. With regard to the requirements of one or more windows, the sum of which shall be equal to one-tenth of the floor area, that is not excessive under any circumstances. Too much is better than too little. The fashion of small windows is largely disappearing. The Model By-laws (urban) allow an earth-closet within a building, and differentiate between the earth-closets and privies. There is no power to enforce the use of moveable receptacles or of earth. A distance of 10 feet for privies from a house is not a hardship. It would obviously be undesirable to allow open drains in small backyards or cesspools. There is no power under the Act to make by-laws as to water supply, and hence their omission. The Public Health Act gives sufficient power to prevent the occupation of houses without a proper water supply. There is nothing in the rural Model By-laws to prevent timber buildings being erected, or the use of thatch. It is impossible to prohibit the use of hollow walls. With regard to the suggestion that the Councils should require walls where the flues occur, &c., to be 9 inches thick, this would rather add to cost of cottage building. The by-laws always define the timber from which scantlings are given. The sectional area is not a sufficient method. The strength varies according to depth and width. There are no clauses as to footings in rural Model By-laws. Footings are not prescribed to be of brickwork, and might be of concrete. The by-laws require only four inches of concrete under buildings, which is hardly sufficient to carry a heavy wall. There are clauses specially prepared to deal with housing provided for transitory labour, and local authorities have power under the Public Health Act, 1907, to licence temporary buildings for this and other purposes.

Mr. Lacey (Oswestry) said the communication of Mr. Searles-Wood had practically cut the ground from under other people's feet in attempting to criticise the paper. There was no doubt this was a very difficult subject, and one could agree that a remodelling of the by-laws, both as to urban and rural districts, might be advisable. There was no doubt that there were things in the by-laws in many districts which were not up-to-date with present methods of construction. Unquestionably, rural conditions should be more taken into account than they had been. It was within his knowledge that the by-laws in some rural districts were even more stringent than those in the urban districts adjoining them, and there was no sense or reason in that. Mr. Ricardo seemed to think that it would be sufficient to have some very generalised treatment, and to leave a good deal of detail to the architect and builder; but he was afraid that would

produce considerable difficulties in administration. There must be laws of control, and there must be obedience to them, for without obedience to the law they would have a state of anarchy. As to the question of a cheaper mode of construction that was an important point, in view of the enhanced price of materials. It might be advisable to cheapen construction, but a cheaper class of building would entail more for maintenance; and perhaps the old adage that the best was the cheapest in the end would apply in this case. There were, no doubt, many inconsistencies in the by-laws, and these should be removed where necessary; but these could only be ascertained by investigation. There must be a minimum fixed, and the danger was that it might be fixed too low. What was put as the minimum was too often regarded by people as the maximum, and they did not set themselves to go beyond the actual requirements of the law. He considered particularly that the by-laws with regard to the air-space about buildings required to be remodelled. He held that where there was not sufficient development to warrant the preparation of town-planning schemes, great good might be attained if the Model By-laws were framed so that a greater amount of air-space should be given at the rear or the side of houses in urban districts than was the case at present. His contention was that houses should not be permitted to be built in long rows of fifty or sixty without a break for the circulation of air. With reference to the concluding paragraph in the paper as to the asking of too much causing danger of a neglect of sanitary laws, he was afraid that by asking for too little the evil would be greater.

Mr. W. B. Pindar (Rural District Councils Association) said the author appeared to have an extremely hazy idea as to the authorities charged with the administration of the by-laws in rural districts. He took it that the author's complaint was not so much against the Model By-laws of the Local Government Board as against the by-laws adopted in particular rural districts, which were considerably more stringent than the Model By-laws. It was a treat to him to attend a meeting where the Rural District Council was given the credit for being somewhat in advance of its statutory requirements, because the complaint generally was that they were behind the times and very slack. With regard to the air-space about cottages, they ought to keep clearly in their minds what the object of land being attached to a cottage was. It was not for the disposal of refuse, but simply to secure free ventilation and light to the building. There was no power, so far as he knew, to make any by-law to provide land for the disposal of refuse, and the proper remedy was to enforce the clauses of the Public Health Act, which empowered the Local Government Board to call on the local authority to undertake the disposal of refuse. As to water supply, that was dealt with under the Public Health Act, and it was illegal to occupy any cottage erected since that date in a rural district unless there was a sufficient and adequate supply of water available for the inmates of the dwelling. He thought that the effect of the by-laws in restricting building operations had been grossly exaggerated. There were at present something like 200 rural districts in England and Wales where there were no building by-laws at all, and he had heard that there was a greater dearth of dwellings in those districts than there was in the districts where stringent by-laws were enforced. If that was so, it seemed to him there was no real basis for the complaint that the by-laws in rural districts prevented the erection of cottages. In these districts architects would have an entirely free hand and a wide field for experiment, and there was nothing to prevent them experimenting in their own materials and according to their own design.

Dr. Tempest Anderson (York) said they were suffering very much at the present time from an epidemic of grandmotherly legislation, and if they went on as they were doing they would soon have to apply to the sanitary authority for leave to blow their noses. Someone had said there ought to be rigid powers to prevent the disposal of refuse about a house, but that he absolutely disagreed with. When he was in practice he attended farmers who lived with the fields around them heavily manured, and the same thing was the case with market gardeners; and yet they were the most healthy class of the community. When plans were being laid out for the building of a village, it was utterly absurd to spend enormous sums of money in putting down expensive and often abortive schemes for carrying the sewage to be disposed of at a sewage farm miles away. If they had a place in the country where they could dispose of the manure round about the house, and by that means convert it into wholesome vegetables, they would be conferring a great benefit on the community at large. In his opinion, the utter waste of manure was one of the greatest national dangers

at the present time. They went on exhausting the land, and took the manure which ought to go back to the land, and by septic tank treatment rendered it incapable of being used on the land. That being so, it was absurd to enforce on rural districts by-laws which might be necessary in the big cities, and which, by the way, had been made generally by public officials living in London who had never seen a farm.

Mr. Munce (Belfast) said that from what had been said that morning one would think the Local Government Board were a set of fools. Instead of crying out at Conference after Conference about the by-laws, why did they not first agree as to the by-laws they were satisfied with, and then discuss the others? The fault lay with the local authorities and their advisers. Instead of coming there and grumbling, engineers and surveyors should explain the whole thing to their Councils, and if they objected to anything and went quietly to the Local Government Board they would find they would be listened to. In Ireland, if they had anything to discuss, they discussed it with the officers of the Local Government Board by arrangement, and showed their reasons for wishing to take a particular course; and they always found the officials most courteous to them. If they sent for a copy of the Model By-laws they would find a space reserved for the making of notes. Why, then, did they not make notes and send them to the Local Government Board? His opinion was that the bulk of them were not able to amend the by-laws.

Mr. Cresswell (Carshalton) said from a perusal of the paper it would seem as if they wished to go back to the Dark Ages. They seemed to forget that the Local Government Board did not force these by-laws on them. They simply issued the Model By-laws, and each local authority had its remedy. It was the bounden duty of the local authority to consider the local circumstances, and each authority had the right to make its own by-laws modelled on those submitted by the Local Government Board and approved by the Local Government Board. Speaking as an architect, he would at once say he would be very sorry to think that any brother architect would endeavour to go under the existing by-laws. If he was worth his salt he would endeavour to go above them, and he had always found that architects did go above them. He had always held that hollow walls were not nearly so good as solid walls. It was a very good thing that a minimum was put in with regard to windows, but he felt that architects would be doing a very bad thing if they got anywhere near the minimum, as it was not sufficient. He agreed with the author as regarded cesspools. He had had a curious experience of adjoining rural districts. In one he had been allowed to put a cesspool with open joints, whilst a few yards away, in another district, he had had to deal with it as described in the paper. It seemed to him that the rural districts should come into line. A good deal was said about utilising timber, but a day or two ago a great authority said that they ought to be wary about using timber, as it was not so sanitary.

Mr. Ricardo, in reply, said he was glad the paper had produced so much discussion. He agreed with Dr. Anderson about keeping the manure in the country. In a rural district they had fields all around them. Where they had sewage enclosed in pipes, unless they were kept in efficient order it meant sewer-gas getting into the houses. They could take things into the open air and not even bury them, and they remained sweet. If the whole country would accept the Model By-laws, subject to bringing them up to date as regarded sewage, and subject to their being a little more reasonable about window space, that ought to be enough. After that, when plans were presented, the local authorities should take on themselves the responsibility of saying they were not adequate if they thought so. It was the taking away of responsibility by putting things into the by-laws which did the harm.

MODERN ETCHINGS AT THE DOWDESWELL GALLERIES.

REPRESENTATIVE original etchings, the work of fifteen artists, are now on exhibition at these galleries, and there are very many really interesting amongst them. Mr. Mortimer Menpes, R.E., would serve by himself to provide a show well worthy of repeated visits; there are twenty-six of his works on view, and it would take less time to schedule such as did not prove of great attraction than to deal with the criticism from the opposite standpoint. A few alone can be selected for notice here. The view in the "Interior of St. Maclou, Rouen," could not be treated more effectively; the light enters from the rear windows and enhances the darkness of the vaulted roof and the cast-shadowed floor. "Windmill

near Barnet" is charming, the light in the sky being effectively shown as reflected in the water. We should consider "The Great Door, Rouen Cathedral," as all that is satisfactory and delightful had there been a little massing of the detail, but as it is there is a slight air of thinness about it. "Cottage, Batsworth Heath," is a perfect landscape; "A Bridge at Srinigar" and "The Bridge of Sighs" are poems, and this is a not uncommon characteristic of Mr. Menpes' work; in the former the mingling of light and half-light is most telling, and the latter is a gem. This, too, may be said of "A Cottage at West Hendred." Other works of this artist must be regretfully passed over in order to pay heed to the exhibits elsewhere.

Mr. Albany Howarth is represented by fifty-one sketches, and with but few exceptions these are good. He is strong on chiaroscuro and can portray atmosphere satisfactorily. "View of Durham" and "Interior of Durham Cathedral" are both excellent in their several styles; in the latter the ornament is suggestively touched in, and the light projected downwards from the unseen "lantern" into the body of the fane is very effective. "Château Gaillard" and "Le Pont des Andelys, Château Gaillard," are poetic in feeling, and this, too, may be said of the mezzotint "Marble Bridge, Copenhagen." "Gourock" is a perfect sketch of a landscape, and "The Blue Mosque, Cairo," gives quite the local essence. Mr. Howarth's Oxford and Cambridge studies must be relegated to a secondary position, though this does not imply that many of them are not good. If we say that some of this artist's work is reminiscent of Mr. Herbert Railton it is assuredly complimentary.

The work of Mr. Ernest Lumsden, A.R.E., does not prove to be inspiring and has the misfortune of being placed between the vigorous technique of Messrs. Menpes and Howarth. Doubtless Mr. Lumsden's works will have their admirers, however. "Seoul, West Gate," is exceptional in merit; and "Les Halles" and "The Great Wall, Shanhai Kwan," must also be selected for favourable notice. Mr. A. P. Thomson is represented by some good work, especially in his Rothenburg sketches; and his "Portuguese Nocturne" is excellent. Of the work of other artists represented, mention may be made of Mr. Arthur Turrell's "Entrance to Duomo, Florence," as being very good and well drawn; it holds a satisfactory medium position between hardness and woolliness. Mr. J. A. Brewer's "Rouen Cathedral from the East" is also very good. Mr. Percy Robertson in "Parliament Square, Westminster," "Victoria Embankment," and "Scarborough Sands" has some pretty little sketches. Mr. Frank Mason's "A Link with the Past" and "The Harbour Light" are good, though the technique is not interesting. The Hon. Walter James, A.R.E., has in "Moorland" a work that is good of its kind, and Mr. Hamilton Mackenzie, R.W.S., A.R.E., has also a good sketch in "Fenwick Church."

THE BRITISH MUSEUM.

ACCORDING to the annual "return" of the British Museum the total number of visitors to the Museum in Bloomsbury in 1911 was 723,571, a decrease of 16,266 in comparison with 1910. The decrease is more than accounted for by the excessive heat of July and August, which discouraged visitors to the extent of nearly 26,000, in comparison with the previous year. The total for weekdays was 659,786 (a falling off of about 10,000), and for Sundays 63,785 (a falling off of about 6,000).

The number of visits by readers to the Reading Room was 223,404, an increase of over 4,000 on the figures for 1910, but still below the totals for 1904 and 1908. The daily average was 745, and the total number of volumes supplied during the year was just under a million and a half, exclusive of the twenty thousand volumes to which readers have free access in the Reading Room itself.

The visits of students to other departments of the Museum amounted to 37,911, an increase of nearly 1,500 on the previous year, and the highest total yet recorded. There were increases in every department except those of British and mediæval antiquities and coins and medals. In particular, there was again a marked increase in the number of students engaged in copying in the Sculpture Galleries.

Progress has been made in the British Museum Extension Building, which should be handed over by the contractor in the course of 1912. Plans for the internal furniture and fittings have been prepared.

Only a small section of the work of reconstructing the roof with fire-resisting partitions was completed during 1911. The usual work of renovation and repair, within

and without the building, was carried out; but it was again found necessary to postpone the re-decoration of the Mausoleum Room.

The chief special exhibition held during last year was that in connection with the celebration of the Tercentenary of the Authorised Version of the English Bible.

A new departure was made during 1911 by the engagement of an official guide to conduct parties round the Museum and to point out and explain the most interesting objects. The experiment was tried provisionally for the six months from May to October, and, having proved very successful, was placed on a permanent footing in December. The guide makes two regular tours each day, taking different parts of the Museum in accordance with a printed timetable; and he is also at liberty to take round special parties by arrangement at other hours. No charge is made to the public in either case. It is impossible to give exact figures of the number of persons accompanying the guide, since the parties usually grow during the progress of the lecture; but it was estimated that not less than 9,000 persons availed themselves of his services during the six months of the provisional institution of the service. There is ample evidence to show that the public greatly appreciate the assistance thus given to them.

During the year excavations were conducted on behalf of the Museum at Jerablus, on the Euphrates, the site of the ancient Hittite town of Carchemish. Sculptures and inscriptions of considerable interest were found, together with a large amount of pottery, which will be of great assistance in fixing the dates of other Hittite sites. The excavations, which promise to be of considerable importance for ancient history, are being continued in 1912.

In the Department of Egyptian and Assyrian Antiquities one of the most interesting additions has been a quartzite sandstone seated figure of Sen-Mut, scribe and architect who flourished at Thebes under the reign of Hatshepsut, Queen of Egypt, about B.C. 1550. It is considered to be a very fine work, and a fine example of the best class of commemorative statues. Sen-Mut was the builder of the temple "Tcheser-Tcheseru" (i.e. "Most Holy"), at Dér al-Bahari.

Another addition is a hard brown stone figure of Pes-shu-per, an official of very high rank, who flourished at Thebes under the reign of one of the Queens Amenartas, about B.C. 630. He was employed in carrying out the restorations of temples at Thebes, and was a temple functionary of great importance. This figure is valuable artistically because of its archaistic characteristics. This, as also the one already mentioned, was discovered at Thebes. An interesting group of Coptic sculptured gravestones and architectural fragments has been brought from the ruins of the famous Monastery of Saint Jeremiah at Sakkârah, which has been excavated during the last few years by the Egyptian Government. They all belong to the period which lies between 700 and 1100 A.D. and they illustrate Coptic funerary Art in one of its most interesting forms, and show the influence of Byzantine artists and sculptors.

The Department of Greek and Roman Antiquities has been unusually fortunate, having obtained at least three accessions which may be counted as of first-rate importance. One of these is a very fine sepulchral relief of the fourth century B.C., of exceptional size, from Attica, which (with the somewhat smaller example acquired in 1910) greatly strengthens the collections of the Museum in this class of sculpture. Another is a bronze head, probably of the Emperor Augustus, of more than life size, with eyes inlaid with glass and alabaster, which was discovered on the site of the ancient Meroë, in Nubia, during the excavations conducted by Professor Garstang on behalf of the Liverpool University Sudan Excavations Committee. The Committee generously allowed the head to be acquired by the Museum at a sum considerably below its probable market value, and this sum was provided by the liberality of the National Art-Collections Fund, which has proved itself this year, as often previously, a most valuable and enlightened benefactor of the Museum. The third important acquisition of the Department is a bronze chariot of the sixth century B.C., found near Orvieto and now restored on a modern core of wood; an object of a very rare class, in a good state of preservation.

The Department of British and Mediæval Antiquities has, as so often before, owed a very large number of its accessions, including some of the most important, to the generosity of private benefactors. A beautiful set of late fifteenth-century church plate from the Hospital de la Vera Cruz, near Burgos, in Spain, was presented by Mr.

J. Pierpont Morgan. A very important collection of Late-Keltic antiquities, of about the first century B.C., found at Welwyn, Herts, and acquired by the late Mr. G. E. Dering, was presented by his daughter. These bronzes are nearly all of Italian origin, probably made at Capua, and include fragments of a *patella* of frying-pan form, two jugs and the mounts of a tankard all closely resembling those found at Aylesford, Kent; and in addition a pair of silver cups. An iron frame of oblong plan with four broad uprights ornamented with twisted columns, and three large fire-dogs with bull's-head terminals are of native work, as are also the pear-shaped "pedestal" urns and other pottery vessels, some of which were in separate burials after cremation and others in two large vaults which contained the iron and bronze objects. All date from about the middle of the first century B.C., and may be referred to the Belgic population.

The Director and Principal Librarian in his introductory statement draws attention to the large proportion of the principal acquisitions of the year which is due to the munificence of private benefactors. It would be impossible, he says, for the Museum to maintain the position which general opinion, both at home and abroad, assigns to it, if the purchase grant voted by Parliament were not largely supplemented by the enlightened liberality of many benefactors, great and small. The number of desirable objects which come into the market annually is so large, and the money value of the more important specimens has risen so greatly, that no Parliamentary grant could be expected to suffice to meet all demands; and it is therefore all the more satisfactory to recognise that private individuals, rich and poor, are more and more recognising the claims of this form of national service.

OUR CONTEMPORARIES FROM OVERSEAS.

The American Architect (New York) has recently included designs for a number of country houses, a theatre at Detroit, a banking building at Sacramento, and a church at Cleveland.

The Architect, formerly *The New York Architect* (New York) illustrates the Bankers' Trust Company building, New York, in its customary admirable fashion.

Der Architekt (Vienna) has some interesting examples of domestic architecture from town and country, and the usual productions of the "new-art" school.

The Architectural Record (New York) has an interesting illustrated article on the sculptures of Charles Keck, and another on the château and gardens of La Granja, on the northern slope of the Guadarrama mountains.

Arkitektur og Dekorativ Kunst (Christiania) gives a good epitome of modern Norwegian architecture from the exhibition of the Christiania Architects' Society, with illustrations.

Berliner Architekturwelt (Berlin) reproduces several exhibits from the Berlin Art Exhibition of this year, and these with the premises of the German Land Bank at Berlin, and some examples of domestic work, make up the staple of the current issue.

Construction (Toronto) illustrates the Quebec Bank, Toronto; the Toronto General Trusts Corporation's building, and the prize competition designs for the new Technical School, Toronto.

La Construction Moderne (Paris) has an article on the museum of Maisons-Laffitte, with good illustrations of some of François Mansart's work.

Deutsche Bauzeitung (Berlin) illustrates and describes competition designs for a town-planning scheme for Düsseldorf, and has a series of articles on the French mediæval fortifications of the Loire and the Rhone.

Het Huis (Amsterdam) concludes its series of articles on Old Zwolle, and deals also with the West Friesland Museum at Hoor, and the convent of St. Catharinadal at Oosterhout, all the articles being illustrated.

Moderne Bauformen (Stuttgart) has for its principal item the work of Herr Hermann Billing, of Karlsruhe, the remainder of the number being occupied chiefly with good interior architecture, mostly domestic.

The Pacific Coast Architect (Portland, Oregon) illustrates an auditorium at Oakland, California, the county museum building, Los Angeles, and a collection of western State domestic work.

The Western Architect (Minneapolis) has illustrations of the Central High School, St. Paul, Minnesota; the Deseret Gymnasium, Salt Lake City; the amphitheatre of the Minnesota State Fair Association; the Hoge building, Seattle; the Columbia County Club, and some private residences.

FORTHCOMING EVENTS.

- Saturday, August 31.*
The Institute of Sanitary Engineers : Visit to Leighton Buzzard, Linslade Urban District Council Pumping Station, and Ascott House.
- Monday, September 2.*
Northern Architectural Association : Students' Sketching Club.
- Wednesday, September 4.*
British Association Annual Meeting, Dundee (September 4-11).
- Saturday, September 7.*
Architectural Association Camera, Sketch, and Debate Club : Walking Expedition, start at Dorking.
The Institute of Sanitary Engineers : Visit to Central London Railway Power Station, Shepherd's Bush.

THE CHURCH AND TOWN PLANNING.

In a recent number of *The Guardian* Canon S. A. Barnett voices a "Plea for Large Churches as the Church of England's Contribution to the Town-planning Movement" that is now one of the leading features of social advancement. With the experience of a vicar for thirty years of a district church in East London, Canon Barnett is depressed by the meanness of the development of the town and the meanness of the churches that accompany it. Long, straight ranks of small houses, each exactly like a hundred others, lead to the dwarfing of minds and souls. The community is awakening to the imperative necessity for the efficiency and happiness of the citizens, that the city shall be convenient, healthy, and beautiful. Canon Barnett would have the Church assist in the endeavour to supply this necessity by erecting churches that should set a high ideal before the eyes of those who build the dwellings of the people, that would attract worshippers and assist them to a reverent mind and attitude. Thus, he urges, the Church might help town planning, as it might help every other social reform, by charging the atmosphere of life with unselfish and sympathetic thought.

The Canon points out that the policy of the Church, in the diocese of London, is and has been to build as many churches as possible, "buildings of conventional character, showing in their mean lines and sterile decoration the trail of an order limiting their cost to £8,000 or £9,000," and he would have the Bishop of London's Fund, or the authorities who direct the present building policy of the Church, change their method of procedure, and by care in the selection of sites and by generous expenditure at the direction of a large-visioned architect do for the growing cities or towns of to-day what the builders of the past did for the cities and towns of their time. His point of view is that one magnificent building, costing £25,000 or £30,000, would attract more worshippers than three cheap buildings of the ordinary type at £8,000 or £9,000 each.

A very difficult question is opened up by the Canon. There can be no doubt that the Church of England, in the diocese of London at any rate, is not prospering. It has lost the hold it had upon the laity thirty or forty years ago. The cause of that loss it is not easy to determine. It has by some been attributed to the growth of the "week-end" habit, and no doubt the two phenomena are to some extent causally connected, but whether the waning popularity of the Church, its churches and its services contributed to the increase of week-ending and, for those who cannot afford week-ends, the abstention from Sunday worship, or whether the stress of modern life has made the week-end an almost imperative necessity and led to the disregard of Church worship we find it

difficult to decide. But, taking into account the amazing popularity of the cinematograph theatre, we are inclined to think that the craving for relaxation might be satisfied, with greater advantage to the higher elements of the people, if the services and the buildings of the Church were more attractive.

Pleasure rather than duty is the motive force of most people at the present day. It is no use telling the twentieth-century man, woman and child that they ought to go to church. They must be persuaded that they would like to go. How they are to be persuaded is the problem for the bishops of the Church to solve. Canon Barnett urges magnificent buildings, each with a large staff of clergy. He would, in short, concentrate, in one establishment, the building, the personnel, and the annual expenditure that are, under the present policy, distributed over three. As the resources of the Church are limited, he would also have to expand his parish to three times its present normal size. Thus, instead of three churches, each costing £8,000 or £9,000 to build, with a staff of one vicar and usually one curate for a population of some five thousand, he would have a £30,000 church with a staff of, say, six clergy for a parish of fifteen thousand.

Now the trouble of the present district churches is, not that they cost only £9,000, but that for that sum they must be planned to accommodate too large a congregation. A beautiful church can be built for £9,000, but not if it has to hold nine hundred or a thousand people. We have had to build some cheap churches ourselves, and we know from experience that it is a heart-breaking task for an architect to attempt to design a dignified church at a cost of £10 to £7 a sitting.

There is another point of view, and we advance it in all candour and friendliness. The parish of five thousand people with its cheap church and its possible stipend does not attract to the priesthood the type of man who is capable of drawing together at the present day a congregation of more than five or six hundred. The average parson of such a parish is not a clerk to his people. Their standard of education and intelligence has risen to a point that requires a cleric of more than average ability and power to take his stand at their head. From this point of view we feel sure there is a great deal to be said for Canon Barnett's ideal. A large staff with an exceptionally able cleric at their head would be able to do the work of a large parish and a large church and would attract and hold the attention and devotion of a large congregation. Whatever architecture can do in the uplifting of the minds and souls of the people would unquestionably be easier of accomplishment by a stately building costing £30,000 than by three mean churches at £10 a sitting. Moreover, the project of a fine and costly building excites enthusiasm, and there are plenty of people who would be proud to participate as donors to the building fund of a

ST. MARY'S CHURCH, SHREWSBURY.

magnificent church who would remain lukewarm or cold when asked to subscribe towards one that is to be cheap and nasty. The architect's enthusiasm also is awakened by the opportunity of designing a building that shall be a credit to himself and his art. We have in mind a recently completed church in the suburbs of London, which with a fine tower and spire has cost £22,000. The parishioners are proud of their church. The money has been raised without much difficulty and there is always a good congregation, so that we have here evidence that Canon Barnett's view is correct and sound.

THE ARCHITECTURAL ASSOCIATION. FORTY-THIRD ANNUAL EXCURSION.— SHREWSBURY.

Illustrated from Sketches by Mr. P. CART DE LA FONTAINE.

THIS year's annual excursion of the Architectural Association has fallen in pleasant places. Shrewsbury is one of the most picturesque old English towns imaginable; full of character, and a place that our veterans have no objection to revisiting, although several members of our party took part in a previous excursion some twenty years ago. We do not propose, for the moment, to go into detail with regard to our headquarters, as this delightful old town is to be visited on Saturday when we have completed the visits to more distant places of interest with which our programme is replete.

First Day, Monday, August 12.

The first building visited (after a devious and unnecessary ride over farm roads) was Albright Hussey Manor Farm, a fragmentary building—part half timber, part brick. This was the moated hall of the Hussey family, but subsequently belonged to the Corbets. The timber-framed portion is earliest, and is richly detailed in the characteristic Shropshire

manner. The brick and stone additions, with large lofty mullioned and transomed windows, date from 1560—about forty years later. There is some typical panelling of 1601 in this portion, and some of the older rooms are also panelled.

Grinshill Manor House, near the quarries, is a plain example of the local manner of building stone houses in the early seventeenth century. It has not the instinctive grace and easy naturalness of the Cotswold type, but is, nevertheless, a pleasant enough style. The unaffected way in which the windows ignore all centre lines in their relations with the gables is notable.

Preston Brockhurst Hall, built by "Mr. Wingfield, of Shrewsbury," who purchased the property from the impoverished Corbets after the Civil War, is a beautiful and complete example of a house in which the Renaissance is really beginning to be felt. It stands on rising ground above the village, and is approached by a walled forecourt with fine gate piers and central steps to a terrace in front of the house. The front is on the E plan, but unequally spaced. The house returned to the ownership of the Corbets in 1743, and possibly to this date may be ascribed the main stair to the first floor and some internal panelling, though it looks earlier. The original stair remains above and below. Traces of garden lay out remain and were measured by some enterprising members. The stable block and other outbuildings to the north of the house are contemporary and good—the former contains its old fittings little altered. At Moreton Corbet chief attention was given to the ruins, partly those of a mediæval castle altered in 1579, and partly an ambitious mansion of about the same date, which remained incomplete at the Civil War and was then ruined. This building presents a south front of about 180 feet in extent of two storeys, adorned with a highly enriched Doric order below and an Ionic order above, both applied in the customary manner of the age. The columns are spaced about 12 feet apart, and the sequence is interrupted at each end and in the centre by lofty mullioned bays surmounted by grotesque ogee gables,

Wilderhope
Manor

while heraldic beasts bearing shields sit upon the parapet above the columns. It is incredible that (as commonly reported) the design should have been brought from Italy by Sir Robert Corbet, but quite possibly he may have brought some Italian workmen. At a short distance northward from the castle lies the church—Norman in its outlines, but with the addition about 1325 of a spacious south aisle separated from the nave by a rather clumsy arcade of three bays. This aisle is known as the Corbet Chapel. There are in the church two altar tombs of members of the family—one late Mediæval, to Robert Corbet and his wife, Elizabeth, and one early Renaissance, both being fully coloured. The tower was built in 1539, and its west doorway shows curious and beautiful detail of a date at which ecclesiastical work is uncommon. The upper stage was added in 1769. On the return journey to Shrewsbury, Battlefield Church was visited. This was originally not a parish church, but a chapel to the College of Priests founded on the battlefield by Henry IV., and was planned accordingly. It was converted for parochial use to supplant the church of Albright Hussey, which had become ruinous. Sketches remain in the church showing its condition in 1853, when the western bays were roofless and a nave and aisles was formed of the east end by the insertion of four Doric columns supporting a barrel ceiling and three narrow span roofs. In 1861 the church was restored by Pountney Smith, in a manner which has evoked some criticism, since the collegiate character was falsified by the establishment of a division both externally and internally between nave and chancel. The chief feature of interest is the occurrence in a church positively dated after 1403 (the year of the battle) of three curvilinear windows with reticulated tracery. Remains showing the extent of the college exist on the south side of the church.

Second Day, Tuesday, August 13.

WROXETER.

Our first halt was at Wroxeter, the Wrekin Cester of the Saxons and anciently the chief town of the Roman province of Britannia Secunda. There we inspected the church of St. Andrew, a curious building with a chequered history, judging by its architecture. In the chancel there are two Norman windows and a south door of the same period. Several fragments of Roman, Saxon, and a bit of Celtic strapwork have been built, haphazard, into the external walls. The Perpendicular tower is a delightful mingling of colour, being constructed of various materials in the same curious manner as earlier portions of the building; the major portion is, however, of red sandstone. There has been some rather brutal restoration, and the south porch was added in 1890.

Internally there are some fine monuments; chief amongst these we noticed an altar tomb on the north side of the chancel to Lord Chief Justice Bromley (1555), whilst on the south is another marble tomb to Sir Richard Newport (1570)

and his wife Margaret (1598), with their recumbent figures surrounded by effigies of their children, as was the usual practice of the period.

Several members were to be observed sketching Jacobean panelling and noting various ornamental devices, such as Tudor roses and scroll-work which form part of the ornament of the Jacobean pulpit in oak.

We had, on the return journey to the main road, a brief glimpse of an imposing fragment of Roman walling which is supposed to have formed part of the south wall of the ancient basilica of the Roman city.

Owing to yesterday's wanderings in search of our pilot car, our Secretaries had taken the precaution of purchasing large boxes of paper confetti, and at all cross roads they left a track of many-coloured fragments to guide us on our way.

This enabled us to twist and turn without a single mistake until we tracked our guiding car to Shipton, and, cold and wet, tumbled out of our motor-brake with some satisfaction at the gate of Shipton Hall, where a fleeting glimpse of sunshine luckily appeared in time for our first view of this fine old place.

Shipton Hall was built about 1589 by one of the Mytton family, and is approached by a terraced garden forecourt. The plan is similar to the letter E; between the gabled wings a slender tower rises in the left-hand corner. From these wings two large square bays project, five lights by two, and running up to the first floor. The whole building is an excellent example of a stone-built manor house in the local style; quiet, effective and showing some refinement in its detail. The tall brick chimneys are well studied and good in outline.

Internally, the hall and drawing-room and some other portions of the building have good Queen Anne decorations; especially we noted a fireplace in the drawing-room with some finely-carved ornamental detail.

The manor of Shipton formerly belonged to Wenlock Priory, but was early in the possession of the Myttons as tenants, for William Mytton, Sheriff of Shropshire, 1456, was "of Shipton."

WILDERHOPE.

After a wayside lunch we proceeded to Wilderhope, where is a very good example of the seventeenth-century house placed on the hillside, and commanding a good view of the surrounding country.

It was originally the home of the Smallmans family; the date 1601 appears in several places, notably over the entrance door and in the plaster ceiling of the hall. An unusual feature is the semicircular stair turret on the north front; this forms a delightful feature externally, and attracted many sketchers.

On approaching the house, one is struck by a splendid stack of five brick chimneys, and the grouping is generally excellent. A remarkable oak door about 5 feet 6 inches wide leads to the small serving passage outside the great hall, but the remainder of the rooms have been considerably altered to

MADELEY COURT.

suit the present tenants. A fine square bay projects on the south front.

Internally, we noticed several good plaster ceilings and a wide span fireplace dating from the original building. Externally, the texture of the coursed rubble stonework from a local quarry no doubt is delightful in conjunction with the stone slates and brick chimneys.

Broncroft Castle, reached after a short run of about five miles, proved to be a modern building of no great interest; some traces of earlier work were to be seen in one of the square towers, and we were glad to linger and accept a welcome cup of tea from the owner before proceeding to

CHURCH STRETTON,

which we reached after a long run, in a heavy shower of rain, which precluded any sketching. Consequently, a brief halt at the village inn was all we did here, and then followed the main road for a distance of about thirteen miles back to our headquarters and a welcome dinner.

Third Day, Wednesday, August 14.

MADELEY COURT.

Madeley Court was the first place visited to-day after a very enjoyable run through interesting country.

Leaving the main road at Wellington, a narrow lane of switchback character led to a desert waste near a pit head, then suddenly down another sharp descent and under a railway bridge, and we came upon the object of our visit.

Madeley Court is now practically a ruin; numerous small cottages have been built into the fine old gatehouse, and the house itself has been altered and added to, especially on the south-west side.

Built probably by Sir Richard Brooke, who died in 1598, the original house was U shaped in plan, preceded by a large

gatehouse with a central arch and two semi-octagon towers standing about 50 feet to the south-east of the main building. One of the wings (W) has now completely disappeared, and was probably removed in Jacobean times, when the porch (P) was added, as the character of the stonework is similar in the end gable and in this porch, with wider joints and little regard paid to bedding in horizontal courses; the old three-light stone mullioned windows appear to have been taken out from the original wing and reset in the newer gable.

The house is a three-storeyed building, roofed with stone slates, part of which have now been replaced by Broseley tiles. The stonework is not in the customary thin, coursed rubble, but rough ashlar in courses, varying in depth from six to twelve inches; the quality of the sandstone in the neighbourhood probably accounts for this, although most of the small houses in the mining district (of which this is now the centre) are constructed of local bricks.

The dormers run straight up from the wall below, cutting through the eaves of the main roof, which are stopped off on each side. A curious feature of the large three-light windows—which are similar to those on the floor below—is the sinking of the labels, owing to lack of space under the coping of the dormer to work the returns of the more usual projecting label.

The chimney stacks are carried up in stone to the eaves line of the main roof, and above this, in the diamond-shaped shafts of brickwork which form a distinctive feature of the houses we have visited in the district.

The gatehouse is similar in construction. The main building is roofed by a single span running at right angles to the entrance archway, now bricked up. The two small towers become completely octagonal above their intersection with the main roof, and are covered with small conical roofs (as can be seen in the sketch). We noticed some good armorial devices and carved panels near the semicircular entrance arch on the lower storeys of these towers, but were not able to inspect the interior of the gatehouse, as it now forms two or three small cottages, and the internal arrangements have probably been completely wrecked.

Of the interior of the house itself one can say little. The large hall (H) is now used as a sort of lumber-room, and has had a part of its extent partitioned off as a store-room for farm implements. A large fireplace occupies the centre of the north-east wall, on either side of which there was a large three-light mullioned window, with a transome. One of these was removed at a later period, and a projecting bay inserted in its place.

A similar room adjoins this hall on its north-west side, and is now used as a fowl-house, whilst at its south-eastern end is a smaller room and a wide passage leading to a side door, and also (by a turn to the right) to the fine solid oak staircase.

The upper rooms are not now used, and some are not accessible owing to missing joists or floor boards. We noticed some old glazing of good design in one window, but otherwise there is nothing of particular interest.

The Jacobean porch at the south-west of the great hall is perhaps a good example of its kind, but the house does not gain by its addition. The detail is florid and coarse, and the workmanship is not as good as in the house itself.

To the north-west of the building is a large walled court or, perhaps, a formal garden some 180 feet wide by 230 feet long. In the centre stands the famous sundial, its diagonals coinciding with the points of the compass. It consists of a large cube of stone on a low stand, with large concave semi-spheres on three of its sides, each of which once held a dial, now gone, showing the position of the moon and planets, as well as the time of the day. The top has a small dome of the same circumference and size as the concave sinkings in the sides.

The Presidential whistle gathered the reluctant sketchers together once more, and we reached

STOKESAY CASTLE FROM THE SOUTH-EAST.

SHIFFNAL CHURCH,

our next item, after quite a short but adventurous drive. The parish of Shiffnal is ancient. In the Domesday Book it has the names of Heshall or Deshall (Hall of Ide), and Schuffenhal or Shiffnal (Hall of Sceafa). Both names were for a long time used indiscriminately, the present definite form first coming into use, alone, in 1330.

The Saxon parish was a large one. Covering some ten square miles, it included Kemberton, Ryton, Sheriffhaies, Dawley, St. George's, Prior's Lee, and part of Oakengates. The Saxon church (of which nothing now remains) was a collegiate foundation. The present church, dedicated to St. Andrew, dates from 1180, and contains examples of the work of successive periods of architectural development from Norman to late Perpendicular.

The original building consisted of a nave, aisles, transepts, south porch, tower, and chancel, which extended to the present Communion rails. Much of this late Norman work still remains, notably in the chancel arch, which the builders of the Early English period did not utilise for the support of the tower (constructed over the "crossing"), the eastern arch of which stands a yard of two west of this Norman arch.

To this period (Early English) the greater part of the church belongs, including the tower, south porch, nave, north aisle, and south aisle (west of the porch).

A curious feature is the projection of the porch into the church, the inner door opening direct into the nave, thus separating the south aisle into two distinct parts which do not communicate. A *parvise* over this porch looks out eastwards on to the eastern portion of the south aisle, the other sides being walled in; it is reached by a small stair leading to a doorway in the south-west angle. A "priest's chamber" at so early a date is unusual. In later years this was used as a parish school, and before the restoration one of the window panes was scratched with a doleful inscription: "Alas! what grief it is to think the freedom once I had."

The nave consists of four bays built about 1250. The north transept was rebuilt after the great fire of Shiffnal in 1591, when thirty-two houses were destroyed. The roof of the nave, chancel, and north transept, the woodwork of the tower, and the six bells all shared a similar fate.

The walls of the north transept were not afterwards raised to their original level, as the roof line outside plainly shows. A curious carving is placed above the Norman arch (already mentioned), which represents a human head, from the mouth of which is growing a fruit bearing, twisted branch. This has been explained as being emblematical of the preaching of the Word—the Preacher, the Word, and the fruit of the Word.

The fine east window belongs to the Decorated period, and the glass was put in to the memory of Bishop Lonsdale, who died in 1867.

The Moreton Chantry at the south of the chancel is so named from its connection with the Moretons of Houghton Hall. It contains several monuments to the Briggs family.

Another interesting monument is that of Thomas Forster, vicar of Shiffnal in 1526, Prior of Wombridge, and warden of the College of Tong. He is represented as a recumbent figure vested in priestly robes (cassock, alb, chasuble and amice). Arms displayed above show a horn quartered pheon. The Forsters were Foresters of the Royal forest of the Wrekin. Prior Forster was related to Tony Forster, mentioned in Scott's "Kenilworth."

Shiffnal Church was restored in 1879 by Scott, and a new

vestry and choir vestry have been recently added (1900) east of the north transept.

We now adjourned to the Jerningham Arms for luncheon, and were struck by the sign, about three feet by two, on which the arms are displayed in colour and gilding. Mention should also be made of some good "black and white" houses in the usual manner, which attracted several sketchers.

A three-mile run on our motor charabanc brought us to

TONG CHURCH,

which has been rather aptly termed "the Village Westminster Abbey" on account of the monuments which it contains.

Before considering these in detail it will not be out of place to devote a few lines to the church itself.

The first mention of Tong is in the eleventh century, when we find it recorded that Earl Roger de Montgomery had endowed a church here (which he presented to Shrewsbury Abbey) before 1094.

There is, however, no trace of this building remaining; the earliest portion of the present edifice being part of the south arcade in the nave, which appears to date from about 1250.

Elizabeth, widow of Sir Fulke de Pembruge, purchased the advowson from Shrewsbury Abbey in 1410, and converted the building into a collegiate church—we mentioned above that one Thomas Foster, "warden of the College of Tong," Prior of Wombridge, and Vicar of Shiffnal in 1526, is buried in Shiffnal Church—and the greater part of the present church of St. Bartholomew, Tong, was built by Dame Elizabeth about 1410.

The east window in the chancel contains some fifteenth-century glass. The magnificent fifteenth-century choir stalls and elaborately carved screen separating the chancel from the nave are splendid examples of skilful and spirited design and execution; traces of colour and gilding can be discerned in the panels of the screen. There is another screen of similar character near the chantry chapel. The vestry contains a piece of mediæval embroidery, said to have been worked by the nuns in the convent of the White Ladies near by; if this is so, the work is at least three hundred and fifty years old. A library of four hundred and ten volumes was presented by Lord Pierrepont some two hundred or so years ago.

Turning now to consider the monuments, which form such a remarkable feature of this church, it will be best to take them in chronological order.

(i.) Tomb of Sir Fulke de Pembruge († 1408) and Dame Elizabeth, his wife († 1446) (the founders of the Collegiate Church). The architectural ornament of this tomb consists of early Perpendicular panelling filled in with plain shields and large square flowers; on the top are the alabaster effigies of the knight in full armour, with his crest of a Turkish woman's head under the figure—see below—and his lady by his side, both in extremely good preservation, as is the case throughout.

This has been accounted for by the friendship of the Hon. William Pierrepont—owner of Tong Castle and church—with the Lord Protector, Oliver Cromwell.

(ii.) The next tomb is that of Sir Richard Vernon, nephew of, and successor to, Sir Fulke de Pembruge († 1451), and Benedicta, daughter of Sir John Ludlow, his wife. Sir Richard Vernon was Speaker of the Parliament held at Leicester in 1426.

This is one of the finest monuments of the period we

have seen: the sculptured figures of saints and angels which ornament the sides are beautiful studies in pose and expression, and the undercutting of some of the architectural enrichments shows great technical skill; the material used is a fine white alabaster. The figures on the top of this tomb show Sir Richard wearing the plate armour of the period and the collar of the S.S.; his lady also has this collar and the curious horned headdress then in fashion.

(iii.) The third tomb is quite different, as in place of the sculptured effigies Sir William Vernon († 1467) and Margaret, his wife, daughter of Sir William Twynfen, are represented on brasses set in a Purbeck marble slab, which forms the top of this sarcophagus. The valiant Sir William, "sometime Knight Constable of England, son and heir of Sir Richard Vernon, and sometime treasurer of Calais," is shown in the massive armour of the "Yorkist" period, an ungainly mixture of chain and plate in use at the time of the Wars of the Roses. His wife wears the widow's whimple, and her feet rest on an "elephant-like dragon." Their twelve children appear as small figures on the lower part of the slab.

The sides show good Perpendicular work in multifoils enclosing shields and flowers.

(iv.) We now come to the tomb of the founder of the "Golden Chantry" and builder of the Castle. This tomb is placed under a Burgundian arch between the church and the Golden Chantry, otherwise known as the Vernon Chapel noticed below.

Sir Henry Vernon († 1515) was a son of Sir William, and guardian and treasurer to Arthur Prince of Wales, elder brother to Henry VIII. By his side is the sculptured semblance of his wife, the Lady Anne Talbot († 1494), daughter of the second Earl of Shrewsbury. The sides of this tomb are decorated with late Perpendicular arches, canopies, &c., coloured and gilded. Sir Henry is shown in the armour of the "Early Tudor" period, and wears the collar of the S.S., as is (v.) Richard Vernon, Esq. († 1517), son of the above, who died before receiving the honour of knighthood; his wife, Margaret, wears a pointed hood, and at the west end of the tomb is the figure of their son, Sir George Vernon, "King of the Peak," as a boy.

(vi.) is probably the tomb of Humphrey, third son of Sir Henry Vernon († 1542 or 45) and Alice († 1531), daughter and heiress of Sir John Ludlow, of Hodnet: their effigies are incised on a slab, and have been much worn.

(vii.) The elaborate Elizabethan tomb of Sir Thomas Stanley († 1576) and Margaret his wife, daughter of Sir George Vernon, a sister of the famous Dorothy Vernon, whose story does not concern us here. Beneath is represented Sir Edward Stanley, son of Sir Thomas and Margaret († 1632). The upper slab or marble table is supported by eight black marble columns and pilasters (in alabaster) in the Doric manner, with finely-carved panels of ribbon work, &c. Above these, four semicircular arches support the slab and figures already mentioned. Eight tall obelisks of black marble complete a strikingly effective monument. At the head of this tomb are inscribed some lines said to be by Shakespeare, which run as follows:—

"Not monumentall stone preserves our fame,
Nor sky aspiring pyramids our name.
The memory of him for whom this stands,
Shall outlyve marbl and defacer's hands;
When all to tyme's consumption shall be geaven,
Standly, for whom this stands, shall stand in heaven."

Sir Thomas is shown in Elizabethan armour, with his cuirass sharply ridged, and wears a ruff. His wife is also in the dress of the Elizabethan fashion.

Sir Edward is shown wearing plate armour and a wide Stuart collar.

For further particulars with regard to the armour of the period, Macklin's "Monumental Brasses" will be found of great interest. We have not the necessary space to go into detail in this report.

A few words of description must also suffice for the beautiful "Golden Chantry" built according to the will of Sir Henry Vernon in 1515. The specially interesting feature is the fine fan vaulting, which is supported by two half conoids in the centre and four quarter ones in the corners; in the spaces left by the conoids two graceful pendants hang. Traces of gilding on fillets to panels account for the name by which this chantry is known. A brass to the memory of (Sir) Arthur Vernon, rector of Whitechurch, and younger son of Sir Henry, is in a very perfect state on the floor. There is also a figure of Sir Arthur in one corner, with an elaborate canopy above.

The old altar slab here has been replaced, but until 1892 it formed part of the floor. In the east wall is an aumbry and traces of a fresco of the Crucifixion, in the south a piscina and several consecration crosses.

There is a rather plain oak Jacobean pulpit bearing the date 1629 in the nave. The church was carefully restored by Ewan Christian in 1892.

Externally, the tower is very curious; the transformation to an octagon and the surmounting spire do not produce a very satisfactory effect.

With regard to the castle, the least said the better: a distant view sufficed for most of us, and that showed it to have a strong family likeness to the external appearance of the Pavilion at Brighton. The present building dates from 1765, when Sir Henry Vernon's brick building was "altered" into what now exists.

From Tong we return to Shrewsbury, with a brief halt at Shifnal for a really welcome cup of tea, thus ending a very full and interesting day.

(To be concluded.)

ILLUSTRATIONS.

DETAILS OF DOOR FROM HATTON GARDEN.

SOME very interesting examples of interior woodwork are to be found in that taken from No. 26 Hatton Garden.

The mantelpieces especially are very varied and rich in character. The doorways, too, with their fanciful cartouches and enrichments, are very finely carved, while the panelling, although simple in nature, harmonises well with the rest of the work. "Plato's" drawing, which we reproduce, was awarded a prize in the monthly competition of *The Architect Students' Sketching and Measuring Club*.

DRAWING-ROOM DOOR, CHUTE LODGE, WILTS.

CHUTE LODGE, Wiltshire, was designed by the Brothers Adam towards the end of the eighteenth century. The plan is quite symmetrical, with a central elliptical staircase having an Ionic colonnade to attic landing supporting the dome. The hall is on north and octagonal drawing-room on south side, and dining-room and library east and west respectively.

The walls and ceilings of the reception rooms are elaborately enriched with plaster decoration in the characteristic Adams style. The chimney-pieces are well designed in various coloured marbles.

The doors are of polished mahogany, and architraves in pine painted white and picked out in gilt. The detail has been carefully thought out, including the beautifully modelled brass furniture.

The elevations are also symmetrical with a bay in centre of each. The lower stage is of rusticated stonework and brickwork above this, with a wide deal cornice.

Mr. J. L. Pearson, R.A., made some additions to the north front and altered the terrace steps. A servants' wing and other improvements were carried out under Mr. C. E. Ponting, F.S.A., a few years ago.

The drawing reproduced obtained for Mr. J. C. Robinson a prize in the monthly competition of *The Architect Students' Sketching and Measuring Club*.

INTERNAL DOOR, CASTLEGATE HOUSE, YORK.

CASTLEGATE HOUSE, York, can boast of being an exceedingly fine example of eighteenth-century architecture, for it is one of the masterpieces of the work of John Carr, of York (1723-1807).

This mansion is now used as a city club, and the members are exceedingly proud of their residence, as the interior fixtures cannot be excelled elsewhere in the country.

The door shown in our illustration is one of four opening out from the first floor landing, all of which are of the same character, except that they vary in ornamentation, which is profusely distributed on them all. The doors are executed in wainscot oak, also the skirting, which has been unwisely painted.

The carved panels over the door are of exquisite workmanship and design; they appear to be carved out of lime-wood and stuck on; each one is of different design, varying from the delicate intertwining of bay leaves to the broad massing of fruit and flowers which is so characteristic of Carr's ingenuity in its prime. The drawing by Mr. G. C. Styles which we reproduce was awarded a prize in the monthly competition of *The Architect Students' Sketching and Measuring Club*.

INTERIOR DECORATION.—III.

GREAT BRITAIN.—I.—TRANSITIONAL PERIOD.—RENAISSANCE.

By ALBERT E. BULLOCK, A.R.I.B.A.

(Continued from last week.)

THE inlaid room from Sizergh Castle, Westmorland, is one of the most complete examples of panelled rooms at South Kensington Museum. The panelling is inlaid with holly and bog oak, the patterns vary considerably, and the whole room presents a very rich appearance.

The period of transition instituted by Inigo Jones, who was born in 1573, was about to be accomplished. At twenty-four years of age he went on his first tour of seven years to Italy, and paid his second visit there some nine years later. In the interim several large houses were in course of erection in the prevailing style, as Boughton House, near Banbury, and Lord North's estate at Wroxton, about which time also the Reindeer Inn was probably panelled.

Sir Paul Pindar's House in Bishopsgate; Canonbury Tower and Somerset Lodge in Alwyne Place, Highgate, all date about 1600 A.D.

Both Burton Agnes, in Yorkshire, and Quenby Hall, Leicestershire, were commenced the year prior to the decease of Elizabeth and the accession of James I. of England and VI. of Scotland in 1603.

Building operations were commenced this year at Audley End, Essex; also alterations and decorations to Knowle House, near Sevenoaks, under the ownership of Lord Buckhurst. Here the ceiling of the Cartoon Gallery is an exceptionally fine piece of modelling and a great favourite. The continuous curved ribs delicately ornamented with the grape vine pattern running the length of the hall give a particularly pleasing effect. The carving to the pilasters is bold, although the work still retains Elizabethan grotesques. The lower portion of the chimney-piece, with double Ionic marble columns, is in better taste than the crowning feature; this latter is, however, rendered less offensive by reason of the contrast. In the ball-room the plasterer has taken a good deal of license in his high-relief frieze. The curved ribbed panelling is an unique example, while the ceiling differs from the long gallery in having the introduction of straight rib work and square panels. The chapel contains some beautiful tapestries from the Mortlake works. The portraits of Vandyke and Crane figure in some of the tapestries here. The house itself is of early Tudor origin, having been built about 1547-60 by Archbishop Bourchier. Thomas More spent his early years here, being a member of the household of John Morton, Archbishop of Canterbury, in 1492. The plan of the buildings conforms to the usual principles of Tudor work, having a gate house on the west side leading to a large quadrangle, on the left of which the stables are situated with a corresponding wing on the right or south side. The entrance to the house courtyard is axial with the gate house, and the great hall faces the entrance, occupying the east side of the court. The south front is of more regular formation, the central colonnade being flanked by the library on the west and the tower on the east, beyond which the chapel can be discerned. The varied changes in ownership hardly concern us in the survey of decorations. Its history will be found in Mr. Tipping's review in *Country Life* for May 25 and June 1, 1912.

Bernard Jansens and John Thorpe are said to have been employed together on Audley End, the latter finishing his work there in 1616. Many chimney-pieces erected in this reign had polished marble and stone inserted like jewels. At Hatfield there is a chimney-piece so treated having several pieces of polished Irish "Blue John" inserted in small carved wood panels. An example from a house at Bristol shows this method of treatment. The ceiling beams are a little heavy, and inclined to dwarf the room somewhat. The carved pilasters are executed in an unusual manner and are quite decorative.

St. Peter's Hospital, Bristol, and the example from Tewkesbury are of much earlier date. The design of the flanking panels in the latter example and the mantel bed-mould anticipate the work of the following period.

The palace of Bromley-by-Bow, which was demolished in 1894, and of which there is preserved an entire room and ceiling in the woodwork section of the Victoria and Albert Museum, would appear to have been erected in 1606, which is the date given on a stone found during the demolition.

The pattern of the ceiling is the same as the ceiling of King James's drawing-room at Hatfield House, except that the latter mentioned example has rather more elaborate pendants. The coat of arms in the centre of the chimney-piece is very boldly carved. The door frames which flank it are of later date. The panelling is bolection moulded, and there is traceable in the carving and arabesques the influence of Italian work.

A candelabra and some fire dogs preserved in the Museum were obtained from Bromley Palace; the former is of seventeenth-century pattern.

John Thorpe was engaged on Sir Walter Cope's residence, Holland House, Kensington, from 1600 until the death of Cope in 1614. In the external architecture there are many features traceable to the influence of a work published in 1577 at Antwerp by De Vries, entitled "*Architectura*."

In subsequent years many additions and alterations were effected, notably by Mr. Saunders in 1796 and more recently by the late Colonel Edis; it is now the residence of the Right Hon. the Dowager Countess of Ilchester.

One of the original rooms has been preserved intact, viz., the "Gilt Room," which is situated on the first floor of the south front. This room was decorated by Francesco Cleyn, who died in 1658. He was brought over from Germany to assist Sir Francis Crane at the Mortlake Tapestry Works, which were rebuilt in 1619 on the north side of High Street at a cost of £2,000.

The "Ancient Parlour" is treated, architecturally, very similarly to the "Gilt Room," but the wall panels are larger, while those to the doors are smaller. There is a curious chair in this room, said by Walpole to be the work of Cleyn. It is painted white and gilt. It has a fan-shaped back, moulded and shaped arms, and the seat is supported on scrolled carving.

The "Gilt Room" is highly coloured. The frieze is painted white with a green centre, and blue ground picked out with gilding. Three sides of the room are uniform. The ends have three pilasters each, the panels, however, are irregular in number. Pilasters are placed between each of the bow windows, and the decorative panelling is continued round the interior of the large bow. Within each panel is a small raised fillet forming an ornamental border in three varieties. The paintings on the panels consist of alternating cross-crosslets with fleur-de-lis, charged with the arms of Cope and Rich surrounded by an earl's coronet, with palm or oak branches in gold shaded with bistre. The figures over the fireplace have the flesh painted, the rest being gold shaded; the lower columns are painted black, the upper ones Sienna marble with gilt ornaments to the lower part of the shaft; the horns and caps are also gilt.

The busts of King William IV. and George IV., when Prince Regent; Lord Holland, Francis Duke of Bedford, Napoleon, and many others now adorn the room, and are the work of many eminent sculptors.

The original painted drawing of this room by Mr. C. J. Richardson is in the possession of Mr. Phenè Spiers.

The measured drawing (published in *The Architect* of July 5) of the remaining side of the first floor front room, No. 17 Fleet Street, recently restored by the late Mr. Clement Sturge, under the auspices of the London County Council, is a typical example of Early Jacobean work, having been executed about 1610—the beam at the south side of the ceiling is given in Roland Paul's measured drawing, and was not reinstated when the restoration was effected. A piece of the original cornice is now in Horniman's Museum. The central panel of the ceiling contains a modelled representation of the Prince of Wales's Feathers accompanied with the capitals "H. P.," which has led some to suppose that the room was once in the possession of Prince Henry. Mr. Philip Norman (who is perhaps the greatest living authority on London relics) states there is no foundation for this assertion.

The hall of the Vicars Choral in South Street, Exeter, is curious in being obviously seventeenth-century work, and yet retaining the linen carved panels of the previous century. The woodwork has unfortunately been painted and varnished, which has taken away much of the effect it would otherwise have. Some of the panelling is deal stained to match the carved work. The hall is of earlier origin than the panelling, the college having been founded by Bishop Brantingham in 1388, whose arms (in conjunction with those of Bishops Oldham and Lacey) are carved on the mantelpiece. The panels of the gallery screen are painted with portraits of some of the Bishops of Exeter, including Leofric.

(To be continued.)

COUNTRY HOUSE SEWAGE PURIFICATION.*

WHEN we come to consider the question of a suitable installation for a small hamlet or isolated country house, whether large or small, we have special factors which have to be taken into account. Some of these special considerations are worthy of discussion. The question of site is the one which has naturally to be considered first, and it is evident that the range of choice must be very considerably limited.

While it should be borne in mind that the installation should be situated as far as possible from the house or houses on the one hand, or from a public highway on the other, this will have to be governed by the question of levels, and the possibilities of final outfall for the purified effluent, and it may be taken as an axiom that unless lifting by some means is feasible it is not possible to obtain satisfactory results with an available fall of less than 5 feet from the invert of the incoming drain or sewer to the final outfall, unless in some exceptional instances the nature of the sub-soil is capable of providing free soakage, as, for example, on gravel or chalk. This limitation of site makes it essential that special steps be taken to ensure against offence from the sewage works to either eyes or nose.

The claim is often made that a properly designed sewage disposal plant should not smell, but it has been pointed out by an eminent member of this Institution that for some reason, at present not fully understood, a sewage installation may be free from smell for 360 days in the year, and yet be a source of offence on the remaining five days. It has often been noticed that such occasional aerial nuisance is specially evident before rain, and the explanation, in my opinion, is that a sudden fall in the barometric pressure draws out the naturally foul air from the interstices of the filter beds, and the probable humidity of the atmosphere inclines to aggravate the tendency to smell.

Thus it is obvious that special provision must often be made in connection with these small schemes for screening and for reducing the possibilities of air pollution.

In practice I have found that the ordinary ferro-concrete or wooden covers to the tanks in conjunction with shallow trays, formed of small mesh expanded metal filled with a layer of peat-moss litter over the filter beds, is sufficient to overcome this difficulty. It might be pointed out, however, that these trays should be above the discharge pipe from the tanks, so as to check the free passage of foul air from the tank when a sudden increase in the rate of flow of the incoming sewage takes place.

The second point upon which I would suggest discussion is the question of increased tendency to smell caused by the relative septic condition of the tank effluent.

The absence of regular attendants, and the impracticability of installing sludge lifting and pressing plant for a small installation, renders it necessary to try to devise some alternative method.

I believe that the Hydrolytic tank of Dr. Travis, in England, the Emscher or Dortmund tanks in Germany, and the modification of these as designed, I think, by Mr. Aird Murray in Canada at the Lethbridge Works, point the way in which this modification should be sought, for in such a tank the liquid sewage which constitutes, I suppose, roughly 95 per cent. of the total volume can be treated in an aseptic condition, while septic action may be utilised for its sole useful function of breaking down and digesting the solid portions, so as to render them more capable of being attacked in the filter bed or removed from the tank.

I have found in a large number of cases that a tank formed somewhat on these lines, which perhaps may be called a semi-septic tank, is capable of discharging to the filter beds an emulsified effluent containing a considerable proportion of the solid matter in suspension, and collecting a thick scum of irreducible fibrous particles at the top, with a very slight deposit of sludge at the bottom of the tank. The capacity of such a tank in relation to the average daily flow is one which requires some consideration, as in my opinion it should be as small as possible, consistent with an adequate scum-forming capacity, so as to require as infrequent attention as possible, and the depth should be great in relation to its area. It will be seen from what I have already said, that personally I am in favour, in the small installations which have not the advantage of regular attention, of passing to the filter bed as large a proportion of solid matter as is possible, in contradistinction to the practice of the municipal engineer, who prefers to keep back his

solids and deal with them in bulk, and to take a very weak effluent on to his percolating filters.

I believe it will be found much easier to occasionally change the material of the upper portion of the filter bed than to increase the quantity of solid matter which has to be removed from the liquefaction tank.

This brings me to another point on which I should like to suggest some thoughts—namely, the effective distribution of the stronger tank effluent on to the filter bed surface. There is no doubt, in my mind, that efficient distribution and aeration are the most important factors in securing a non-putrescible effluent.

No form of perforated pipe distribution should be allowed on account of the constant liability to choke, neither can small rotary contributors dependent for their movement upon the reactionary pressure of the outflow be relied on; and any system of fixed sprays, even if sufficient head is available, are liable to cause some smell, although they possess the advantage of increased aeration if they can be used in isolated places.

An upward water-logged filter cannot by any possibility be more than a mechanical strainer, and this might be more easily arranged by means of fine wire screens. The provision of a filter bed which depends for its distribution on the overflowing of a series of ducts or channels, which, although originally fixed level, never remain so, results in the sewage short circuiting through the bed in two or three places, and is more or less useless.

I have found that the most satisfactory method of distribution is by means of a series of serrated edged channels or troughs which may be fed intermittently by means of either an oscillating tipper or from a dosing syphon, or, better still, may be made to revolve or travel over the surface of the bed by mechanical or hydraulic pressure. There is another small point which should be considered in relation to small sewage installations which is of little moment in connection with a public sewerage scheme, and that is the provision of suitable grease-traps. Grease or fat is the slowest substance to be affected by aerobic bacterial action, and tends to clog the interstices of a filter bed and prevent the liquefaction process in a septic or semi-septic tank.

Hence the flushing-rim grease-trap, which, excellent as it may be when it is desired to easily discharge all such matter from a kitchen sink into a public sewer, is not suitable with a private sewage installation, and a large capacity trap, preferably of twenty or twenty-five gallons, so as to avoid the necessity of too frequent attention, should be used; this should be fitted with properly constructed dirt-basket or scoop, and cleaned out at least once a fortnight. This will make considerable difference to the efficient working of the sewage purification plant, and lessen the chance of smell from the installation.

Another point which should be noticed is that great care should be taken with the use of disinfectants. These are so freely used nowadays in houses connected to public sewers, and yet the volume is not sufficient to interfere with the municipal sewage works, but the writer has frequently found the bacterial action of a small installation entirely suspended and the tanks and filter-beds rendered practically sterile by this means. If infection from the effluent be feared, then disinfect after purification, and not before, or else it is probable that the purification will not take place at all.

A word or two may be said in comparison of the relative cost of installing and maintaining a municipal as against a private installation. I think it may be fairly assumed that the capital expenditure charges are about 30s. to 40s. per head of the population dealt with in the former case, as against £4 to £5 per head from a private installation.

The relative figures as to maintenance may roughly be put at from 7d. to 1s., as against 1s. 6d. to 2s. per annum. If the initial cost of a private installation seems high, it must be remembered that in many country districts the only alternative is the old cesspool system, with its constant expense and danger to health, and, fortunately, the builders of country houses are gradually being educated up to realising that an expenditure for this purpose is a wise one.

In the discussion on Mr. Tuke's paper, Mr. W. Kaye Parry (Dublin) said he had been associated with the question of sewage purification for a great many years, and there was one observation he desired to make on the whole subject so far as it related to country house and isolated institutions. It was that the younger men there would perhaps learn something by looking back and seeing how the question was handled by early reformers in sewage purification. In his early days Mr. Rogers Field, Mr. Bailey Denton, and others dealt very successfully indeed with the sewage treatment of country houses, and many of the in-

* Abstract of Paper read before the York Congress of the Royal Sanitary Institute by Mr. John E. Tuke (Member).

stallations which they put in were excellent models, which could even be followed with advantage at present. They believed, as he believed then, and did still, that sewage purification could be dealt with in a country house without putrefaction, for the reason that the sewage came down within three or four minutes from the time it entered the drain. What Mr. Rogers Field did was very simple. He screened out the solid matter as well as he could, and he allowed the liquid, which at that period was inoffensive, to flow over the land where the land was suitable. Mr. Bailey Denton put it through a process of intermittent filtration, which was really the bacteriological process, although he did not know it. Most excellent installations were carried out and were working well at the present day. Twenty-five years ago he himself installed a system for the late Duke of Leinster. The sewage was screened, and the liquid was put on the land, and was still being put on the land. From that day to this they had had no trouble. Unfortunately a good many of them came under the septic tank heresy, which was that they could not purify sewage without putrifying it first. In large towns the sewage was putrid before it reached the works, but he was satisfied that the solution of the problem so far as single houses and isolated buildings were concerned was to deal with the liquid whilst it was fresh. They should get the best screens they could to screen off the solids, which they could mix with dry earth and put on the garden with the greatest possible advantage. Then they could deal with the liquid so that it did not smell, and there was no trouble or offence. He was ashamed to confess that he was bitten with the septic tank heresy, as he thought it must be right, but he tried it and had never been half so successful as with the earlier work he did, and he was inclined in his old age to go back to the lines on which he started work. He thought that to a large extent Mr. Tuke was with him.

Dr. Tempest Anderson considered that troubles arose because the whole system of sewage treatment was wrong in theory and possibly because it had been forced upon the world by practice. In the large towns it was impossible to use any other system, but the difficulties increased in proportion to the size of the installations put in. But to put these installations in small villages seemed to him absolutely repugnant, and if the same ingenuity had been expended in getting the manure on the land the results would have been fifty times better. He supposed, however, that sanitary engineers found it more profitable to put in large installations, on which they got a large commission.

Mr. Costain (Great Crosby) said he well remembered attending a congress when Dr. Cameron introduced the septic tank theory, which it was expected would create a new heaven on earth. He did not think it had done all that was expected of it; but for a large country house or for a number of smaller houses he considered an adaptation of the septic tank principle absolutely superior to the system described by Mr. Kaye Parry. The solid matter required very constant dealing with, and it was not possible to get it satisfactorily dealt with. By the septic tank and subsequent filtration they got a liquid matter which could be easily dealt with, whilst the solid matter could be dealt with once in six months.

Mr. Burleigh (York), as an architect, thought local authorities were making a big mistake in insisting on water-closets in country districts and having large sewage works which entailed a lot of money. Dr. Poore had told them that in Holland they had no water-closets and the Dutch were not a weakly lot of people, but, on the contrary, were very energetic and were able to export a lot of foodstuff, because they took advantage of natural conditions and used the manure for the land instead of throwing it into the sea.

Mr. Fairbank remarked that with a properly designed sedimentation tank of not too large a size, and with large, coarse clinker and a fine and regular distribution over it, there should be no nuisance with a small installation for a house of ten or fifteen people.

Mr. Tuke said that whilst agreeing with Mr. Kaye Parry as to dealing with the liquid when fresh and sweet, he thought it was impossible to arrange for the screening out of the solids for a small house or hamlet. With regard to manurial value, would not efficient treatment in a tank such as the last speaker suggested give a liquid possessing even more fertilising value than crude sewage?

MR. JOSEPH HUMPHREYS, architect, Maesteg, has been appointed architect for the cottage hospital proposed to be erected at a cost of £2,500 at Maesteg, Wales.

CHURCH ARCHITECTURE IN NORTHAMPTONSHIRE.*

At Northampton, where we are somewhat south of the centre of a very long and narrow county, we are on the border-line between two architectural districts. To the west and north, in a somewhat broken and hilly country, where good building stone is rare and there are no facilities for water-carriage, the church architecture, although it is not without its points of interest, and although there are several notable exceptions to a general mediocrity, has no features of special beauty or of local interest.

Near the south-west extremity of the county there is a group of churches in and near the Cherwell valley, where the greenish Hornton stone is employed from Oxfordshire quarries, and the mason-work is consequently allied to that of which the Oxfordshire churches of Bloxham and Adderbury are the most noble examples.

But when we speak of the churches of Northamptonshire we refer especially to those of the district east and north-east of Northampton, and to the special type of architecture which was developed in and near the valley of the Nene. Here conditions prevailed entirely opposite to those which in the hillier parts of the county checked architectural development: building-stone was plentiful and a navigable stream made it easy to obtain the best stone from the quarries of Barnack, Ketton, and Weldon, none of which are far removed from the river valley. The churches of the Welland valley on the north-east border of the county, although not equal to those of the Nene valley, form a subdivision of the same architectural province, connecting it with the churches of Leicestershire and Rutland; while in the neighbourhood of Peterborough we come into close relation with the fenland and marshland churches of Lincolnshire and the district round Wisbech, which owe their exceptional beauty to the use of Barnack stone. There are thus points in common between the architectural conditions of Northamptonshire and those of Lincolnshire, and in both cases the county town stands at a point at the head of a navigable river, where on one side in an upland and scantily watered county the interest of the church fabrics is occasional and unequal, while on the other side in the well-watered lowlands almost every church has a special claim to distinction. It may be noted, however, that while the church architecture of the borders of Lincolnshire affects rather than it is affected by the influence of neighbouring counties, the borders of Northamptonshire, an entirely inland shire, show a distinct tendency to receive impressions from outside.

Only in one Lincolnshire district, the right bank of the Trent at and below Gainsborough, and the neighbouring isle of Axholme, is external influence very clearly manifest, where the river becomes a vehicle for Yorkshire magnesian limestone.

In Northamptonshire, on the other hand, although Barnack provided Lincolnshire, Cambridgeshire, Norfolk, and even Suffolk with a large amount of stone, yet the influence of the neighbouring districts is clearly felt. The quarries of Ketton and Clipsham were both outside the county; and just as in Lincolnshire north of Stamford the Ancaster quarries had their influence on the country west of the Witham, so in Northamptonshire the mason-work of Rutland seems to push its influence south and east of the Welland and meet the type of mason-work represented by the Nene valley churches.

In one respect Northamptonshire has a considerable advantage over most other counties. Probably Durham, Kent, and Lincolnshire are the only three counties which can compare with it in the possession of remains of pre-Conquest churches. Apart from the interesting survival of the foundations of the Saxon abbey church at Peterborough, we have at Brixworth the most complete example in England of an early church on the basilican plan—shorn of its aisles, it is true, and otherwise modified, but a building of the original disposition of which the signs are very distinct. The great size of the church at Brixworth and the free employment of Roman tiles in its construction, led, as is well known, to the theory, once very generally held, that the building was a Roman secular basilica, converted to the purposes of a church. This theory, which was fantastic in itself and historically unsound, has long been abandoned; but there seems to be no reason for disputing the high probability that the greater part of the present church was built about A.D. 680 by a colony of monks from Peterborough. Its antiquity is therefore equal to that claimed for the oldest

* An abstract of a Paper with lantern illustrations read on July 24 by Mr. A. Hamilton Thompson, M.A., F.S.A., at the Summer Meeting of the Royal Archaeological Institute at Northampton.

parts of the churches of Monkwearmouth and Jarrow; while in one respect, the triple arcade in the screen wall between the nave and the space in front of the apse, it shares a feature with some of the earlier churches of the group associated with St. Augustine and his followers in Kent, and with the outlying churches of South Elmham in Suffolk and St. Peter-on-the-Wall in Essex. But Brixworth, apart from one or two special features of its own which give it an absolutely unique value among early Saxon churches, has also the rare peculiarity, which elsewhere is not so easy to discover, that the greater part of the modifications in its structure may be referred to a date earlier than the Conquest. The late Mr. J. T. Micklethwaite, in a famous essay which appeared in the *Archæological Journal* some fifteen years ago, claimed that no less than four different periods of Saxon work were to be detected in Brixworth Church; and although the claim is possibly excessive, there can yet be no doubt that the fabric underwent at least one considerable effort of repair and alteration, and that at a date which may be tentatively assumed to be earlier than the eleventh century.

It is noticeable that there is only one definite feature at Brixworth—the large triple window-opening on the first floor of the tower—which connects it with any of the architectural details of the equally famous tower at Earl's Barton, so that, however many periods of Saxon work may be discovered in the church, there is one period, generally taken as characteristic of Saxon church-building, of which at Brixworth hardly any traces survive. To this period belong the tower at Earl's Barton and the lower part of the tower at Barnack. In their exceptional dimensions these are allied to the ground plan of the tower at Barton-on-Humber in Lincolnshire, which the Institute visited three years ago. But while there we have direct evidence as to the plan and dimensions of the Saxon church, of which the ground floor of the tower formed the nave, the actual plan and extent of the fabrics at Earl's Barton and Barnack are doubtful. At Earl's Barton there seems, as at Barton-on-Humber, to have been a somewhat narrower building, probably a chancel east of the tower, so that the tower may have formed the body of the church; but at Barnack the building east of the tower was wider, and the ground floor of the tower was used, as a triangular-headed recess in the west wall indicates, for some purpose not immediately connected with Divine worship.

"Long-and-short" quoins and strip-work of dressed stone, forming decorative bands upon the surface of the rubble masonry, are features of the towers of Barnack and Earl's Barton, and at Earl's Barton diagonal strips connect the upright pieces with a very ornamental effect, which recalls the effect of the superimposed arcades of strip-work, one triangular-headed, the other round, at Barton-on-Humber. A striking feature of the tower at Earl's Barton is the use of baluster shafts to divide the window-openings, both in the top and lower stages. These are purely ornamental facings to the solid pieces of wall which form the actual divisions, and, unlike the mid-wall shafts of late Saxon date or the baluster shafts in the tower window-opening at Brixworth, they are merely supports to the front parts of their arches. While the original top stage of the tower at Barnack has been superseded by a beautiful late twelfth-century octagon, Barnack has a compensation for this loss in its fine and unusually broad tower-arch, while the tower-arch at Earl's Barton appears in its present state to retain no original feature.

Professor Baldwin Brown has given reasons for assigning the date of work of the Earl's Barton and Barnack type to the later part of the tenth century. Although this theory cannot be accepted as a certainty, there is yet much historical evidence to back it up, and it sets important considerations in array against the cherished idea that strip-work and its concomitants were derived in the first instance from construction in timber. Assuming this date for the towers, there is a gap of at least three centuries between them and the earliest work at Brixworth—a gap nearly equivalent to the time which separates us to-day from Sir Thomas Tresham's buildings at Rushton and Rothwell. Of late Saxon date also are parts of Geddington, Green's Norton, Pattishall, Wittering, and other churches. As to the relative date of these buildings, it is impossible in our present state of knowledge to make any positive statement. It will be noticed, however, that in all we find certain details which are distinctively of a Saxon type, and that we are not met, as in the case of the so-called Saxon towers of Lincolnshire, by features which seem to be derived from a foreign source.

In addition to the remains of churches to which a pre-Conquest date may fairly be attributed, there are a certain number of that type which is earlier than the twelfth century, but has none of those features which are specially Saxon.

Of the simplest type of Norman church plan, the plan with an aisleless nave and a rectangular or apsidal chancel, Northamptonshire has hardly any unaltered examples. The small chapel of Sutton Bassett, in the parish of Weston-by-Welland, is the only example which I can recall at the moment of writing this: it has a rectangular chancel, and has been subjected to much alteration. So much rebuilding went on during the thirteenth and fourteenth centuries that in this part of the country a large amount of Norman work was swept away. Churches with twelfth-century arcades are rarely found, and it is only here or there, as at Whittlebury, near Towcester, or at Wakerley, in the north of the county, that a twelfth-century chancel arch survives.

In Northampton itself, however, the walls and columns of the circular nave of St. Sepulchre's are of the early part of the twelfth century, while a considerable amount of the old walls of the aisleless choir are left above the arcades. The lower part of the tower of St. Giles's, though partly rebuilt, may be assigned to the early part of the century, while the arcades of St. Peter's, with their unusually rich sculpture, appear to belong to a few years later. Of these three churches, two, St. Sepulchre's and St. Peter's, have uncommon and exceptional plans. St. Giles's, on the other hand, has kept from first to last its transeptal plan with a tower over the crossing. The cruciform outline of the church was practically absorbed before the end of the Middle Ages by the addition of wide aisles to the nave and chapels to the chancel, but the central tower above the crossing remained. Now, a church with a central tower is as great a rarity in Northamptonshire as a church with an aisleless nave and chancel. Putting Peterborough, the one church of the first class which is left standing in the county out of the question, there remain only five churches of any importance, so far as I remember, that have central towers. They are at Castor, near Peterborough; St. Giles's, Northampton; Duston, Weedon Lois, and Barton Seagrave.

But although there are so few existing examples of a plan with a central tower, there are, on the other hand, several churches where the original existence of such a plan is indicated, either by the persistence of the transeptal element in the plan or by signs which point to the destruction or absorption of transepts during the later Middle Ages. There was undoubtedly a tendency of the later mediæval builders to absorb early transepts within widened aisles, and the probability is high that, where we find transepts, with or without a central tower, those transepts are not likely to be the additions of an age which had other and more convenient methods of enlarging its churches. The influence of the transept, whether it was retained or obliterated, was great upon the ultimate plan of the church. This fact can be studied to advantage in churches so well known and so apparently different on plan as Burford, Cirencester, or St. Mary's, Shrewsbury; it is constantly exemplified in village churches such as the fine churches of Arksey, Campsall and Hatfield, near Doncaster. Now, of the churches which are included in the programme of our meeting, a large number—possibly, if we knew the truth, the majority—were originally planned with transepts and probably with central towers. Of the twenty-six, five, including Brixworth and Earl's Barton, have western towers which existed in whole or in part as early as the twelfth century. These churches had no central tower, so far as can be ascertained. Eighteen have western towers which appear to be additions to the original plan. In this category is included the exceptional case of St. Sepulchre's, Northampton. Of the other seventeen there are seven cases in which a transeptal plan may be postulated with some degree of certainty; three in which a western tower has been added to a simple aisleless plan without transepts, and seven as to which a decision is difficult; but two of which, Holdenby and Cogenhoe, probably belong to the class of rebuilt and enlarged non-cruciform churches. Three more complete the twenty-six. St. Giles's, Northampton, our one example with a central tower remaining; Fotheringhay, entirely of the fifteenth century, so that we have nothing left of the older and probably smaller nave of the church; and Canons Ashby, the fragment of a priory church of Austin Canons, the plan of which falls in a different category from those of parish churches.

To the eight churches—nearly a third of the number—in which we have thus found traces of a plan with transepts and probably with a central tower may be added several other examples from other parts of the county. There are numerous instances in which the existence of a broad south or north aisle or two broad aisles may have been the result of taking the length of the transept for the width of the aisle.

I already have referred to the unusual occurrence of Norman arcades in Northamptonshire churches. Out of sixty-

three churches described in the well-known "Architectural Notices of the Churches of the Archdeaconry of Northampton" only three possess arcades of this date, and in no single case of these three are the whole of the nave arcades of one building. At Spratton, where there is a beautiful late twelfth-century north arcade, the south arcade is of the middle of the thirteenth century. This does not prove that aisles were not added to many of these churches during the twelfth century. But it indicates that during the later part of the thirteenth and early part of the fourteenth century much of this work must have been removed as capable of being improved upon.

In the fenland district, where much fine work was done in the early part of the twelfth century, and where masons were fully as active during the thirteenth and fourteenth centuries as in the Nene valley, there was not in the later period so wholesale a destruction of the work of an earlier date. Such churches as Long Sutton, Walsoken, and Whaplode widened their aisles, but left their old arcades practically untouched.

It does not necessarily follow that the quality of twelfth-century workmanship in Northamptonshire was inferior; the capitals of St. Peter's, Northampton, reach a high level of excellence in their special type of sculpture, while the doorways at Earl's Barton, Castle Ashby, and the porch at Great Addington are carved with great elaborateness and refinement. But it is possible that some Norman arcades were low and stunted, as they are to-day at Gretton, and were ill-suited to the lofty and well-lighted aisles which it now became the fashion to design. At any rate, when Tansor Church was enlarged in the thirteenth century the unusually tall twelfth-century arcades, with their lofty and slender columns, were left, and their proportion was generally followed by the eastward additions now made to them, and this in spite of the fact that the retention of the old work set the builders a difficult problem in planning the new. Tansor and Warmington appear to have set a local fashion of tall arcades with slender cylindrical supports.

(To be concluded.)

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

II.—PLANS.—VAULTING.—TRIFORIA.—CLERESTORIES.—COLUMNS.

(Continued from page 95.)

ONE of the most graceful conceptions of the fourteenth-century architect in Italy is the triforium in the nave of Lucca Cathedral. Of unusual loftiness, it is continued, as at Pisa, across the entrance to either transept, and with extremely fine effect. Each bay contains two windows of three Pointed compartments trefoiled, and these windows light the passage formed between the groined roofs of the aisles and the raftered lean-to ones. The comprising arches of these windows are semicircular, and contain exquisitely beautiful traceries formed by filling the spaces between intersecting mullions with foliated circles, as in the Campo Santo at Pisa.

At Lucca, the triforium, which is returned with captivating effect across the west end of the nave, is everything, the clerestory windows being merely circles filled with tracery of varying character, and of the greatest beauty and refinement. These circles pierce the space just below the wall-ribs of the richly decorated four-celled vaulting.

Florence, Orvieto, and Siena Cathedrals, as well as Sta Croce in the first-named, are destitute of triforia, but the clerestory at Orvieto, Siena, and Sta Croce is very finely developed, and rises directly from the string course above the arcades, but in none of these cases is it possible to institute any comparison between them and the corresponding parts of English churches without entirely condemning the Italian designs.

At Orvieto a peculiar feature in the elevation of the nave is a species of quasi-triforium—namely, a gallery above the pier arches, defended by a pierced parapet, and returned in the form of a much loftier covered gallery across the west end of the nave; while at Sta Croce an iron balcony, curiously prolonged over the arches opening into the transepts, answers the same purpose.

If we go to the exteriors of Italian Gothic churches we shall find the same dissimilarity to northern buildings; an almost entire absence of buttresses, and in their place pilasters, round which the strongly-marked string courses and cornices are returned in a way curiously different from the practice of cis-Alpine architects.

At Siena there are huge cross-walls instead of flying-buttresses, and at San Francesco, Assisi, large round masses of masonry clumsily tiled at the top, and which at first sight might be taken for miniature apses. The aisleless church of Sta Chiara in the same city, with its Angevine-like interior, has some of the largest flying buttresses to be seen anywhere, built against the north wall of the nave, which, if somewhat ungainly, are not altogether devoid of picturesqueness. But as a rule flying buttresses are dispensed with, even in the loftiest buildings.

Then, again, no mediæval Italian architect seems ever to have hesitated a moment about any amount of sham construction; and we must go to Italy prepared to accept sham gables and iron ties in all directions, as very important and regular features, in place of the rigid truthfulness which so honourably marks our own ancient architecture. The roofs, too, are almost invariably of flat pitch, though this is not of much importance, as they were thus best suited to the nature of the climate. But the Italian, deficient in the true Gothic spirit, and afraid of a bold confession of the truth, not infrequently attempted, as at Siena, Orvieto, and the Capella della Spina, at Pisa, to conceal this fact by the addition of sham fronts and gables of extreme unreality and, in some instances, of great unsightliness.

In the treatment of architectural mouldings the same likeness to Classic work is seen in Italian examples. They are generally thin reedy arrangements of hollows and fillets, with very little variety of contour, and it is rarely that any care is taken to fit them for the place they have to occupy. In the Pisan examples, for instance, we generally see a nearly similar section in the jamb and arch, but between them is inserted a capital of considerable size and great projection, for which there is no possible use, and quite fails (as do the majority of Italian capitals) in performing the function so carefully attended to in all northern work, of gathering together the arch-mouldings and transmitting them through the bearing shafts to the ground. It should be said, however, that the Italians had a leaning towards sharp lines of shadow, and with a sun such as that which generally lights up their walls they could well afford to neglect the kind of mouldings in which our ancestors indulged, perhaps to excess.

In all these respects, therefore, the feeling exhibited by the mediæval Italian architects was more like that of their Classic forerunners than that of the contemporary artists of England and France, and of this we are constantly reminded in examining their works.

We may now pass to the consideration of a very interesting and important feature—the feature, in fact, which may be said to stamp an ecclesiastical interior with an individual character—the column.

The isolated or detached column is one great and lasting beauty derived from Classic examples in Italy. The people of that country, finding it used in their Classic and Byzantine buildings, persevered in its use from the earliest Romanesque period, through the whole of the Pointed Gothic, down to the Cinque Cento, after which, under the sway of the Roman Classical, it fell into comparative desuetude.

It is true that, as time rolled on, there was a less free use of it in Central Italy, but it was never entirely ignored. We cannot say as much for our ancestors. So long as the influence of Italian art is visible in French, German, and English Gothic, so long the isolated column was used, and just in proportion as that influence decreased, so did the frequency of its use decrease.

Among the exceptions to the use of the circular column, so prevalent in the churches of Genoa, Pisa, Lucca, Prato, and Pistoja, may be mentioned Lucca and Florence cathedrals, where they are angular masses of complex form; Perugia Cathedral, a building of the German "hall" type, with aisles as high as the nave, where they are tall octagonal ones; Sta Croce, at Florence, where they are octagons, but of more massive proportions; and Siena Cathedral, in which the black and white marble columns dividing the nave and choir from their aisles are composed of a cylinder surrounded by four slender shafts, of which that facing the nave is carried up through the white marble capital to the string-course below the clerestory windows, with an effect which can hardly be called successful. Nor does it appear

to be of any use further, as it has nothing to do with the transverse arches of the vaulting.

The magnificent clusters of shafts at the west end of the nave of Genoa Cathedral have already been described.

Of columns composed of shafts attached to piers, three examples may be mentioned. In the fine Pointed Gothic cathedral of San Donato at Arezzo their plan is half-octagonal shafts at the cardinal points of the pier, divided by the leaves of a large quatrefoil. The bases are banded and finely moulded; the octagonal subshafts have capitals of an almost Classical character, under a square abacus; and the longitudinal arches are obtusely pointed. The vaulting shafts rise, uninterrupted by the lower capitals, to a higher level, where their capitals are connected by a horizontal string.

At Sta Maria Novella, Florence, where the arches diminish in width from west to east—a device probably meant to give an effect of increased length, as in the choir of Canterbury and the nave of Chartres—the piers are alternately different. Their plans are four half-circles set on a square, with the intervening edges of the square cut into semi-octagonal nook-shafts, alternating with a square left plain on its north and south faces, and having on the two others a half-circle between two smaller nook-shafts. They all have a banded base, of two rolls divided by a quirked hollow, set on rectangular stilted plinths, with their angles scooped off.

(To be continued.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS. HUDDERSFIELD TOWN PLANNING COMPETITION.

THE Secretary of the Royal Institute of British Architects desires us to state, for the information of Members and Licentiates, that the Competition Committee are in communication with the promoters of the above competition with a view to the amendment of the conditions.

COMPETITION FOR CONSTABLES' HOUSES, AYR.

MEMBERS and Licentiates of the Royal Institute of British Architects are informed that this competition has been vetoed by the Glasgow Institute of Architects on account of the unsatisfactory nature of the conditions.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Garden Cities.

SIR,—During the past few days a paragraph has gone the round of the Press, under the heading of "A New Garden City," stating that a new garden city is being started at Dorecourt, and the details given show that on fourteen acres of land ninety houses are to be built.

May I again be allowed to point out what a garden city really is? After thirteen years of propaganda by the Garden Cities and Town Planning Association, it might have been supposed that the term "Garden City" was tolerably familiar, and that its real meaning was understood by all thinking people taking any interest in social matters. As the appearance of the above-mentioned paragraph this week and scores of similar instances during the year show that there is still a good deal of misunderstanding, might I be allowed to define the essentials of a garden city as distinct from a garden suburb and from ordinary development? They may be stated as follows:—

1. That before a sod is cut or a brick is laid the town must in its broad outlines be properly planned with an eye to the convenience of the community as a whole, the preservation of natural beauties, the securing of the utmost degree of healthfulness, and proper regard to communication with the surrounding district.

2. That in the town area the number of houses should be strictly limited, so that every dwelling should have ample light and air, with a suitable garden, and that public recreation ground and open space should be provided generously.

3. That the town area should for ever be surrounded by a belt of agricultural and park land, so that while in the centre the urban problem is being dealt with, the rural portion, which should be the larger part of the estate, may be avail-

able for farms and small holdings, in order that the small-holder and market-gardener may have a new market direct to hand for the sale of produce.

4. That the return on capital should be limited to, say, 5 per cent., any profit above that amount being applied to the estate itself for the benefit of the community.

5. That the town should be not merely residential, but also commercial and industrial, that provision should exist for taking the worker and his work away from the crowded centres into the fresh air of the country district, where not only should the land be cheaply obtainable for the employer, but the worker should have a comfortable cottage at a convenient distance from his labour.

It is therefore essential that the land should be of considerable area, and its development should be in the hands of one controlling body, which, in Mr. Howard's scheme, should have for its ultimate object not the making of huge profits, but the improvement of the conditions of life for all who live on the area. The estate should be somewhere from six to ten square miles in area, and in order to give effect to the desire for the combination of town and country about two-thirds should be reserved for the rural area.

It will, therefore, be seen at once how absurd is the designation "Garden City" when applied to fourteen acres of land.

A "Garden Suburb" provides that the normal growth of existing cities shall be on healthy lines; and, when such cities are not already too large, such suburbs are most useful, and even in the case of overgrown London they may be, though on the other hand they tend to drive the country yet further afield, and do not deal with the root evil—rural depopulation.

"Garden Villages," such as Bournville and Port Sunlight, are garden cities in miniature, but depend upon some neighbouring city for water, light and drainage; they have not the valuable provision of a protective belt, and are usually the centre of one great industry only.

The garden city, therefore, stands as the preventive, not as the palliative.

I should be glad to forward further information to any of your readers who may desire it, and I beg to thank you for the opportunity of warning your readers against proposals which claim the name of "Garden City" but possess none of its essentials.—Yours faithfully,

EWART G. CULPIN,

Secretary The Garden Cities and Town Planning Association.

An Old Fire Patent.

SIR,—In view of the interesting weekly series of patents, &c., appearing in your columns, the accompanying may prove attractive, dating back, as it does, over two and a half centuries.

The original broadsheet is in the British Museum, where I came across it some time ago in searching for other matter. I think, Sir, that architects will be very much interested, too, in the new building block described and illustrated in this week's issue of your most interesting journal.—Faithfully yours,

August 12, 1912.

PERCY L. MARKS.

BROADSHEET.

Artificial Fire, or Coale for Rich and Poore.

This being the offer of an Excellent new Invention by Mr. Richard Gosling, Engineer (late deceased), but now thought fit to be put in practice.

Read. Practice. Judge.

A method of artificial coals by a compound of clay, small seacoal, sawdust, and chopped straw made into bricks or fire balls.

Greenwich Heath or Hounslow Heath turf is very good fewell.

London. Printed for Richard Cotes for Michael Spark, senior. 1644.

THE CATHEDRALS AND CHURCHES OF ROME AND SOUTHERN ITALY.

It is perhaps not altogether clear why the cathedrals and churches of Rome should be joined in any connection with those of Southern Italy, except that in the neighbourhood of Rome there must necessarily be the effects of Roman influence on the architecture of the churches in its neighbourhood, and it is only as we get away from Rome that specialities of the features that mark the churches and cathedrals of Southern Italy become more marked.

It has, however, apparently been a matter of convenience for Mr. Francis Bumpus to link together Rome and Southern Italy, partly, no doubt, because his treatment of the churches of the South is rather in the nature of an introduction than a complete essay, and therefore it does not extend to sufficient length to form more than an appendix to the bulk of his volume. The greater part of the latest book * by Mr. Bumpus deals with the cathedrals and churches of Rome. Of these Mr. Bumpus has discoursed in his usual thorough and attractive fashion.

Mr. Bumpus briefly alludes to the catacombs as the earliest places of Christian worship, and the chambers in the houses of the wealthy Christians as the earliest churches, and then explains the adoption of the basilican form of plan for churches erected on the full emancipation of the Christians at the beginning of the fourth century under Constantine. He, however, goes a little further than most, and suggests that the seven great basilican churches built by Constantine were probably all law courts originally.

The method which Mr. Bumpus has adopted in the treatment of Rome is first of all an epitome or classification of the several churches which show similarity of treatment in regard to features of composition or plan or are related in date; thus, in dealing with mediæval work he groups together the churches which have campanili or belfries, of which he says, "there are forty in the city rising conspicuously in square towers of brick-work, mostly adorned with inlaid crosses and discs of porphyry and bright green and yellow earthenware, and divided by cornices (the loftier by seven such) and marble or terra-cotta corbels, between which are open arcade-windows with marble colonnettes of various sizes, whose heavy and barbaric capitals are also various."

Another subject which forms an opportunity for classification is that of orientation, which Mr. Bumpus considers is in Rome a question of great interest.

The true cause of the departure in the planning of Roman churches from strict orientation is no doubt that suggested by Mr. Bumpus, that many of the most ancient

churches will be found to lie parallel with or at right angles to existing streets which we know to occupy the same direction as in ancient Rome.

There were, of course, occasions, as at St. Peter's and the Lateran, in which the builders had a free hand, and in those instances in Rome the basilicas were usually made to orientate west, while their altars orientate east, that is, the orientation of the altar was preferred to that of the church.

Other special peculiarities under which the churches of Rome are classified by our author are the simple basilican plan with a nave and aisles on either side and an apse; then those with the transept between the apse and the nave with its two aisles, not, however, extending beyond the breadth of the latter, so that the building appears as a parallelogram on plan; following these we have basilicas in which the transept projects, or has been extended, beyond the breadth of the aisles. Basilicas without aisles, round or octagonal churches, basilicas which have entablatures instead of arches upon their lateral columns, churches with an atrium or a confessional crypt, all of these form qualifications under which Mr. Bumpus has grouped the churches of Rome. He then proceeds with a detailed description of several of the more important basilican cathedrals and churches. These are St. Peter's, San Giovanni Laterano, San Giovanni in Fonte, Sta Maria Maggiore, San Paolo fuori le Mura, San Clemente, Sta Agnese fuori le Mura, SS. Quattro Coronati, Sta Maria in Trastevere, Sta Prassede, Sta Maria in Cosmedin, Sta Maria sopra Minerva.

He afterwards follows with a description of the more prominent Renaissance churches of Rome, namely: Sta Agnese, Piazzini Navona; Sant' Andrea della Valle, Sant' Ignazio, Il Gesu, Sta Maria in Vallicella, Sta Maria degli Angeli.

In dealing with St. Peter's Mr. Bumpus is both descriptive and critical, and takes the view, which is probably right, that Bramante's original design was very much finer than anything afterwards projected or executed, but he also holds the opinion that Michel Angelo's design was superior to the church as carried out. For the interior he has the highest admiration, and he says, "Internally St. Peter's is not only grand, beautiful and vast—it is absolutely sublime."

In speaking of the colour decoration of the interior Mr. Bumpus makes a digression to emphasise, as cannot too often be done, the fact that the mediæval churches of Europe were in their prime masterpieces of colour, and not, as it is the fashion nowadays to regard them in their present bare and cold clothing of native stone, works in monotone.

San Giovanni Laterano, as the primordial cathedral of Rome, comes next to St. Peter's in the author's description, and very fully he has recounted its history, its vicissitudes and its magnificences. San Giovanni in Fonte is but the baptistery of the Lateran, commonly

* *The Cathedrals and Churches of Rome and Southern Italy.* By T. Francis Bumpus. Forty-two illustrations. (London: T. Werner Laurie, 16s.)

known as the baptistery of Constantine, although that Emperor was not there baptized.

Sta Maria Maggiore best preserves of all Rome's ancient basilicas all the essential features of the ancient Romanesque, although nothing of its early character is visible externally by reason of the additions and encrustations made chiefly in the sixteenth, seventeenth, and eighteenth centuries. Much if not most of this is of excellent character and detail, although Mr. Bumpus does not consider it quite satisfactory.

San Paolo fuori de Mura is now, though magnificent and stately, no longer a record of the past, for the disastrous fire of 1823 necessitated the entire rebuilding, or rather replacement, of the old monument of the earliest ages of Christianity by what our author stigmatises as a huge Pagan temple in a variety of the Classical style prevalent at the beginning of the last century. The beautiful cloisters and some valuable adjuncts saved from the conflagration give Mr. Bumpus an opportunity for exultation.

Of these great churches and of the other basilicas of which our author discourses at length he gives to his readers a charming picture of their history, their legends, their beauties, architectural, pictorial and plastic, that renders his book an invaluable aid to those who would intelligently appreciate the basilican churches of Rome.

Turning now to the churches of the Renaissance period in Rome, we find that Mr. Bumpus defends himself from "the entirely undeserved reputation of being a blind admirer of everything Northern and Mediæval," and shows that whilst he appreciates the excellences of Gothic architecture at their full value, he is broad-minded enough to recognise the merits and keenly critical enough to note the demerits of the Renaissance work also. He combats the assumption of Pugin that the Pointed style is Christian and all other Pagan, and puts it very neatly that "it is not easy to understand how strictly architectural forms can be invested with a theological character." Of several of the leading architects of the Renaissance in Italy we have a thumb-nail character sketch which shows correct appreciation. The account that Mr. Bumpus gives, however, of the Renaissance churches he describes is but short. He has not lavished upon them the fecundity of fact that he has bestowed upon the basilicas.

The cathedrals of Southern Italy are described by Mr. Bumpus briefly and tersely, and introduce us to a fascinating study of the several influences of Lombard, Saracen, Norman and Greek upon the peculiar development of mediæval architecture that is to be found in the province of Apulia and the other parts of Southern Italy. We should have liked to have heard more from Mr. Bumpus of the churches of this district, but recognise that there is a limit to the size of a volume, and we cannot complain that we have not a full measure of interest and information in the latest book with which Mr. Bumpus has enriched the literature of architecture, pleasantly instructive and full of much erudition and painstaking research set out by an able critic.

THE ARCHITECTURAL ASSOCIATION. FORTY-THIRD ANNUAL EXCURSION.— SHREWSBURY.

Illustrated from sketches by Mr. P. CAET DE LA FONTAINE.
(Concluded from last week.)

Thursday, August 15.

An early start by train was made for

STOKESAY,

which we reached after a good half-mile walk from Craven Arms Station. The first thing that impressed us on reaching the castle is its delightfully picturesque grouping—the castle, gatehouse, and church, form together an almost ideal group of harmonious buildings, each retaining a certain distinctive charm, yet blending admirably together to form the larger whole.

Next one observes the beautiful colour of the stone work: a rich yellow, tinted with browns and greens for the most part, though in exposed positions (as in the stone slated roof) a purple shade is noticeable. The oakwork of the half-

timbered gatehouse, too, is not of the everlasting "black and white" variety, but has weathered a lovely silver-grey shade. The castle—which should be more correctly described as a fortified manor house—is of various dates: the earliest portion would appear to be the north tower (1215), which is now entered from the banqueting hall by a solid oak stair. In 1240 the great hall was added, together with the retiring-room, or solar, at its southern end, to which access is given by a flight of external stone steps.

The south tower was built about 1290, and in 1291 Laurence de Ludlow received permission to "strengthen his mansion at Stokesay with a wall of stone and lime" and to crenellate it."

The entrance to the inner court is under the beautiful Elizabethan half-timbered gatehouse mentioned above; this is a two-storeyed building, the lower part being divided into two halves by the entrance way: the stout oaken door to this still remains *in situ*. In the spandrels over the archway are quaint carvings of Adam and Eve in the garden of Eden, and heads, scrolls, &c.

The windows are glazed in small diamond-shaped panes of leaded glass, and a good deal of the original glazing appears still to exist.

We were particularly struck by the ingenious manner in which the valleys to the stone-slated roofs are worked, more especially in the main building.

Seen from inside, the roof has the usual large valley rafter, but, in front of this and tight up to the under side of the roof are two smaller rafters, about a foot apart, carrying the slates in the valley, which are at an angle of 45° to the two intersecting lines of roofs. These slates are smaller than those of the main roof, but are cleverly arranged to gauge with them, and are only just tucked in at the angles. The method seems very effective, as we did not find a single place where the rain had come through.

Stokesay has recently been so often described and measured—a framed "sun print" hangs in the north tower—that we do not propose to say any more about it here.

PLAISH HALL.

The church of St. John the Baptist close by was badly injured at the time of the Civil War, and was practically rebuilt in 1654, but has a Norman door on the south side. The small tower groups up well with the surroundings. One of our most ardent sketchers took up a rather perilous position on the angle of the parapet of this tower, and we were amused to note that, later, he appeared (in a sketch-book belonging to another member) as a pinnacle.

After an excellent lunch at the Stokesay Castle Inn, we made our way to Craven Arms Station, and entrained for

LUDLOW,

the next place visited, and here we spent the remainder of the afternoon; even then we should have found our time all too short had it not been for the fact that the rain came down too heavily to permit of sketching towards the end of the day.

But we were fortunate in having almost a glimpse of sunshine once or twice during our stay.

The church of St. Laurence first claimed our attention; the well proportioned tower of more than usual height is a landmark for twenty miles or so round Ludlow.

In his "Antiquities of Shropshire," the Rev. R. W. Eyton says there are reasons for believing the church at Ludlow was originally dependent on Bromfield, and was founded at least one hundred and fifty years previous to the Domesday survey. The church now consists of a chancel of four bays, which in spite of a long and eventful history, has the appearance of being entirely in the Perpendicular manner. There is a double vestry to the north of this chancel, and chapels on either side of the first bay. Westward are the tower over the "crossing"; north and south transepts, and a well-proportioned nave and aisles of six bays—which again give the Perpendicular effect, although the outer walls and windows are of much earlier date.

The windows in the chancel contain glass of very good design, especially the large nine-light east window, where scenes from the life of St. Laurence are depicted. From an inscription forming part of the design this appears to have been executed about 1450. There is also a "low side-window" in the eastern wall here, which is an unusual position.

In the north wall is a rather battered Easter sepulchre, beneath which is placed the tomb of Sir Robert Townshend, Chief Justice of the Marches of Wales and Chester, and Alice his wife; figures of six sons and six daughters also form part of the monument, which is in the Classic style, with just a trace of Perpendicular feeling here and there in the details.

Nearly opposite, in the south wall, is a monument, decorated with excellently designed shields containing armorial bearings; it commemorates Lady Ambrosia Sydney, daughter of Sir Henry Sydney, who died in Ludlow Castle in 1574.

Another good tomb here is that of Edmund Walter, "Chief Justice of the three shires in South Wales and one of His Majesty's Council in the Marches of Wales," and Mary his wife, which bears the date 1592.

The choir stalls are finely carved, and the "miserere" seats curious.

Both nave and chancel have fine panelled oak roofs with carved and coloured bosses, &c.

The hexagonal south porch is a fine example of the "Decorated" period, and it is interesting to note that this was taken down and rebuilt without alteration in the fifteenth century; this is proved by the discovery of fragments of fourteenth-century glass between the vousoirs of the ribs of the sexpartite vaulting, and a string course with Perpendicular section in the lower part.

An excellent and detailed description of this fine church will be found in Cranage's "Architectural Account of the Churches of Shropshire."

A visit was next paid to the castle, and we noticed, by the way, several interesting old houses. The town hall has rather a good early Renaissance front, with a well-proportioned bell turret, and a Doric portico over the main entrance, of which we give a sketch.

The next item on our programme was a visit to Ludford "hospital, manor, and church." This proved disappointing: the lady of the manor did not receive the party with any show of hospitality, and a somewhat cursory inspection of the rooms which we were allowed to visit revealed a charming plaster ceiling and some good brass and pewter. The adjacent church had nothing of particular interest to recommend it to the sketchers, but we noticed a good bay window in half timber and stone on this side of the house.

A well-restored little half-timber building near by, once the Bell Inn, was certainly worth the slight *détour* we made to examine it. A charming little porch in oak, dated 1614, with turned balusters and a stone-slatted roof, gave a distinctive note to the building.

We recrossed the river by the massive old stone bridge, and paused a moment to admire a picturesque view of Ludlow, with the wide and steeply rising street leading to the old town gate forming an effective foreground to the picture.

The weather being rather too moist for further sketching, we repaired to the famous Feathers Inn for tea.

The large room on the first floor here has a splendid ceiling and a fireplace with Jacobean panelling, &c.

In the room below is another fine fireplace, with a vigorously carved and coloured coat of arms.

Externally, the inn is one of the best examples of half-timber work in the town, and is richly ornamented with carving. We regret the varnish and white paint, which gives a "black and white" effect certainly—as required by our American friends—but also produces a "sticky" appearance which is not pleasing.

Friday, August 16.

Owing to the omission of our chauffeur to call for the luncheon basket for the party, we started half an hour late, and a threatened breakdown of the motor after a stiff climb still further added to our delay in reaching

PLAISH HALL,

a fine brick and stone Tudor building, probably built by William Leyghon (1607), whose elaborate monument is at

Langley
Gatehouse

Cardington Church. He was Chief Justice of Wales. Plashe, or Plaish, was "licensed" in 1520, but the work now existing is of somewhat later date.

We have here a variant on the popular \sqcap shaped plan, the two wings extending beyond the main block giving an H form. The main block contains the hall, with a fine open timber roof, a minstrels' gallery, and screen.

The house faces south-east, and in the eastern wing is a fine panelled room with rich carving, for which we had not time for more than a glance. Another room has good panelling and plasterwork, and the two circular staircases with solid oak treads in the angles of the original entrance-front should be mentioned.

The chimneys in cut brick of varied design have a quaint—but rather mythical—story attached to them.

It is said they were executed by a criminal who was to be condemned to death by hanging; the unfortunate man endeavoured to escape the penalty by promising Judge Leygton that he would build such chimneys to his house as had never yet been seen, or should the like be built again. He built the chimneys, but was hanged. The Judge thus both satisfied justice and made it impossible for another house to have such chimneys. A sun-dial with the following curious inscription stands in the well-kept garden:—

"Serene he stands among the flowers
And only marks life's sunny hours.
For him dark days do not exist,
The brazen faced old optimist."

A punctual start was decreed, in spite of unfinished sketches, and a half-hour's run brought us to

PREEN MANOR,

an early house by Mr. R. Norman Shaw, designed and built in 1870-72.

It is a fine house, with tall brick chimney stacks and many gables—treated with great ability in the local black and white style, although we believe the half-timbering is only about 1 in. thick.

The lower portions are in brick with stone dressings, notably the vigorously designed arch of the main entrance door.

Before entering the house we inspected the little chapel which adjoins it at the end of the northern wing.

Preen Church dates from the second half of the thirteenth century, but the eastern part is probably earlier, as it was the chapel of a Cluniac cell of Wenlock; the western part was parochial. It is quite a small place, the internal measurements being 69 ft. long by 12 ft. 9 in. wide, a rather surprising proportion, which, however, gives a satisfactory effect and provides seating accommodation for about 100.

There is a curious "low side window" in the north wall, with traces of staples and rebates for a shutter below the transome. All the windows are simple lancets, and there is a simple open roof, consisting of rafters and collars, the plate being at about 15 ft. from the floor level. The church

contains a wooden pulpit dated 1646, and some good incised stone slab monuments.

We lunched in the fine dining-room of the house—which is now unoccupied. All the principal rooms are on the first floor owing to the slope of the ground, which transforms part of the lower floor into a basement.

The wide stone staircase leads to a large upper hall in the centre of the house; the oak stair to the bedroom floor starts immediately opposite, and grouped round are the dining-room, drawing-room, boudoir, and smoking-room; this last opens on to the upper terrace, some 350 ft. long by 22 ft. wide, a fine walk with a wide path and green lawns; to the north-west a high brick and stone wall gives protection to a long bed of flowers and creepers.

Below is another terrace about 250 ft. in length, and a well-planned formal garden with shrubs and fountains about 50 ft. wide extends to the south as far as the shubbery at the end of the lower terrace.

A short drive through pretty country brought us to

LANGLEY,

where, incorporated in some farm buildings of no particular interest, is a fine bit of ashlar stonework in a gatehouse of the late fourteenth century, with two gables, and a portion of an embattled wall adjacent to it on one side. The kneelers in the small gables are remarkably large stones for this district, and the large archway is curious in having no hooding or weather moulding.

The roof is as usual covered with local stone slates.

The outer front is of half-timbering and of later date.

Some members visited the small chapel, which lies about a hundred yards to the north-west. It is in a deplorably neglected condition, and is now used as a fowl-house.

The date on one of the roof principals is 1601, and remains of modelled plasterwork and moulded rafters, together with some delightful pews of about the middle of the seventeenth century, show that it must have been worth preserving in a better manner than is now unfortunately the case.

From Langley a short drive brought us to

PITCHFORD,

where we visited the hall and small church near by. Pitchford derives its name from a bituminous well near the hall.

This, the finest example of half-timber work in the county, was built in 1473 by William Ottley, Sheriff of Shropshire, whose descendants continued to reside here until 1807, when it came into the possession of Lord Liverpool, whose daughter, Lady Louisa Cotes, was the mother of Lieut.-Colonel Cotes, the present owner.

The building follows the typical \sqcap shaped plan, consisting of a central block and two long wings of equal length terminating in slightly overhanging half-timbered gables. In the centre of the main block a projecting gable of rather more ornate character, and containing a clock in its upper part, marks the original entrance. Similar projecting gables are placed in the angles, where the two wings join the

main block. This main block was extended under the direction of the late George Devey to the north-west to form a servants' wing, containing kitchens and domestic offices, and has been carried out with excellent discernment. It would be difficult to say definitely where the work started, save for some marks of a circular saw on the timber framing. This addition gives to the present entrance front a tremendous appearance of length, happily punctuated by the large projecting chimney stacks with their strong vertical lines of plain diamond shafts. The general effect is very pleasing.

Internally, the house is of much later date, and the panelling, &c., mostly dates from Jacobean times; in the room over the present library is the entrance to a secret chamber and exit from the house, which is cleverly contrived without the use of any iron lock or latch by means of a sliding rail in the panelling.

A fine, and we should imagine almost unrivalled, collection of family and other portraits by Reynolds, Hoppner, Gainsborough, and other noted painters is a remarkable feature of the internal decoration, as is also a valuable collection of furniture, the whole place displaying taste and refinement. In the study we noticed drawings and prints of pedigree horses and "setters," and in the room below a good fireplace, brought here from Woodcote Hall, which bears the arms and crest of the Cotes family in the centre panel.

By the kindness of the owner we were entertained to a most excellent tea, and Col. Cotes being away, were taken round by the housekeeper, who was able to give answer to many, if not all, our questions.

On our return to Shrewsbury, and at a convenient time after dinner, the usual social evening, with smokes, drinks, and sketch-books all circulating to the accompaniment of informal speeches and general conversation, marked the end of our excursion, as the proceedings on

Saturday, August 17,

were individual, no programme being forthcoming.

Most of us spent the morning in a glance at the various buildings of interest in the town—chief amongst these being St. Mary's Church.

St. Mary's was for centuries a collegiate church and a Royal free chapel, but, strangely, there are hardly any authentic documents relating to its history. Archdeacon Lloyd, in a paper read to the Shropshire Archaeological Society in 1891, gives reasons for believing the original foundations to have been the most ancient in Shrewsbury, dating from Early British times, and investigations have shown that a portion of the foundations of the Saxon church exist. The Commissioners appointed by Henry VIII. to report on the churches and religious foundations of the district state in their report that "the Collegiate or Parish Church of St. Mary was founded by King Edgar for the maintenance of a dean, seven prebendaries, and a parish priest." Between 959 and 975 King Edgar is reported to have made this a Royal free chapel, and it remained exempt from episcopal jurisdiction until 1846, even now being under a special class. With regard to the present church,

Cranage, in his work on the churches of Shropshire, says: "About the middle of the twelfth century, in Stephen's reign, a cruciform church with low central tower was built, one bay short of the present one. In the transepts chapels still remaining were built, with possibly other chapels in the east wall. The nave, still without aisles, was made slightly wider than the Saxon nave. Less than twenty years later another tower was built at the west end of the church." From 1190 to 1210 some important alterations were made: the chancel was vaulted and another bay added, also chapels opening into this chancel. Aisles were added to the nave and a south porch built. In 1480 the vaulting of chancel was removed, the central tower taken down and a clerestory built from east end to old western arch of tower, and a similar clerestory was added to the nave, together with the splendid panelled oak roof (see below). A spire was added to west tower and the room over south porch rebuilt and a small staircase added. In 1579 new windows were inserted in the east end, and in the south chapel after a great storm which wrecked existing ones. The church was restored by Pountney Smith in 1864-70, and a vestry was added by Paley and Austin in 1884. Repairs to the spire were in progress during the early part of 1894, when on Sunday evening, February 11, during a gale, about 50 feet of the upper part of the spire was dislodged and fell on the nave roof, which was wrecked; this was carefully restored by Mr. Lloyd Oswell, who also designed the north porch, erected as a memorial to the late Archdeacon Lloyd in 1897. In the church is a remarkable collection of stained glass from various sources, collected and inserted here by the Rev. W. G. Rowland.

The Abbey Church did not fill us with any particular enthusiasm, and the addition of the chancel cannot be said to rank with Mr. Pearson's more successful achievements.

The White Hall is, perhaps, the most interesting building now existing in Shrewsbury, from an architectural standpoint as distinct from the picturesque. This building is supposed to have been built by a lawyer, Richard Prince by name, who purchased the abbey property at the Dissolution and used stones therefrom for the construction of this house. To avoid unpleasant comment, this red sandstone was then whitewashed, and from this fact the name of White Hall was derived.

The house, completed in 1582, is preceded by a little gatehouse of two storeys, with a large central archway and three-light window in a small gable over; this little building (like the main block) is built of the red stone referred to above, which has weathered badly, so that the whitewashing process may have been dictated from other reasons than those mentioned: one small piece of wall to which a coating

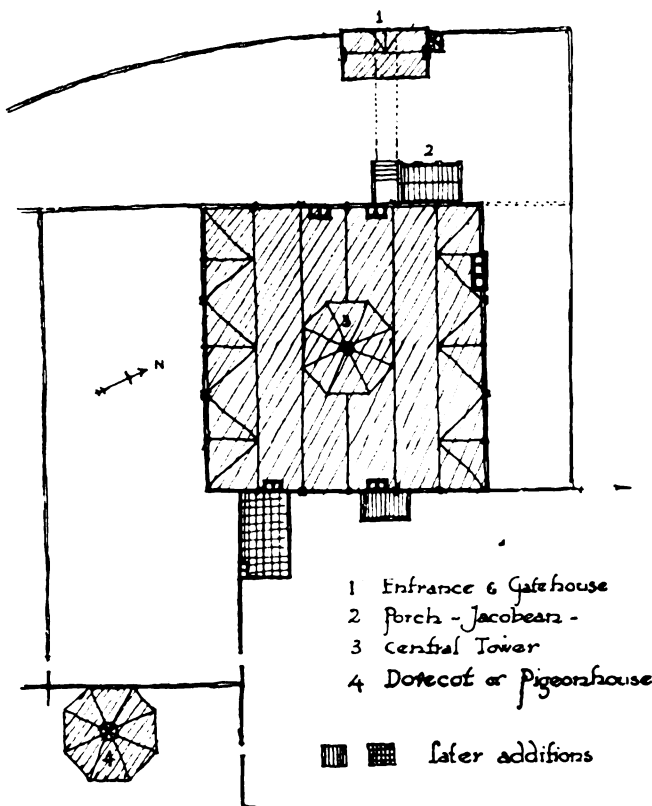

of plaster still adheres stands out in bold relief to the perished stonework around.

The red tile roof and the red brick chimney-stack and coping to the gables are surprisingly effective, and do not clash with the sandstone below.

From this little gatehouse a paved walk leads directly to the original entrance to the house, up a broad flight of stone steps and through a projecting porch in the Classic manner of slightly later date than the house.

THE WHITE HALL SHREWSBURY

Sketch plan showing Roof, & Lay out

The hall is a three-storeyed building, square in plan, and the arrangement of the roofing is ingeniously planned to show three gable ends on each front. In the centre of the building rises a high octagonal turret glazed with large windows all round and covered with a lead roof surmounted by a vane. The chimneys are particularly good examples of Tudor brickwork.

The present entrance to the building is on the east front, whilst to the south a large walled garden and lawns afford a pleasing prospect.

Here also stands a fine octagonal brick pigeon-house of the same period as the adjacent hall, the detail resembling Layer Marney, in Essex, to a curious extent.

To the south and east are fruit and other gardens, stables, &c.

Retracing our steps towards the town, we recrossed the fine old bridge known as the English bridge (1774), and so up Wyle Cop, a typical Shrewsbury Street, with several excellent timber-framed buildings on either side, in one of which the Earl of Richmond (Henry VII.) lodged on his way to Bosworth in 1485. The road at the top of this steep climb diverges; the turn to the left leads us to

THE MARKET SQUARE,

where, from the base of Clive's statue, by Marochetti, the two finest half-timbered houses of the town are best observed. That on the right of High Street, "Owen's Mansion," is dated 1592; whilst on the left stands "Ireland's Mansion," which is probably slightly earlier.

In the centre of the Square stands the old Market Hall, built in 1595, a plain stone building standing on an open arcade with windows, &c., showing good work of the period.

We now turned our steps towards the Raven, our week's headquarters, for the last time. The excursion of 1912 had joined its predecessors, and was a pleasant memory of congenial companions and interesting buildings, set in some of the most beautiful surroundings imaginable.

It is due in no small measure to the careful way in which Messrs. Brown and Hemmings framed their excellent programme that we shall not remember the discomforts occasioned by the vagaries of the weather, but only the charm of the delightful spots we visited.

In conclusion we should like to thank the Vicar of Shicnal for valuable information with regard to the history of that church and parish, and to acknowledge our indebtedness to the Revs. D. H. S. Cranage, M.A. (whose excellent work on the Churches of Shropshire we have already referred to), and H. J. Auden, M.A., F.R.Hist.Soc., author of "Shropshire" in the Little Guides series.

COMPETITION NEWS.

HUDDERSFIELD.—The Competitions Committee of the R.I.B.A. have considered the conditions of the Huddersfield Town Planning Competition, and while they cannot advise the Council to bar the competition, they consider the conditions in many respects unsatisfactory.

RANGOON, BURMA.—Messrs. Ogilvy, Gillanders & Co., of 67 Cornhill, E.C., agents for the Rangoon Municipality, write for the information of intending competitors for the new Municipal Buildings that the date in the conditions in Clause 28 has been altered from August 31 to September 28, and in Clause 14 from January 1 to February 1, 1913. The latest date for posting letters to reach Rangoon by the latter date will be by the Indian mail of January 10, 1913. The assessor appointed by the Committee is a Fellow of the Royal Institute of British Architects.

ILLUSTRATIONS.

DRAWING-ROOM DOOR FROM REDHEUGH HALL, GATESHEAD.

The drawing we reproduce was submitted by "Alpha" in the monthly competition of *The Architect Students' Sketching and Measuring Club*, and awarded a prize. A short description of the door is given on the drawing.

WALDORF HOTEL, LONDON.

This building needs no further description than is given by our illustrations.

A SCHEME has been matured for the enlargement of the Catholic Church at St. Anne's-on-Sea at a cost of £4,000.

MR. ROBERT MORHAM, aged seventy-three, of Edinburgh, architect, for thirty-five years Superintendent of Works to the Corporation of Edinburgh, has left estate valued at £10,769.

MESSRS. A. HARRISON & COX, architects, Birmingham, have prepared plans for a new church which is to be erected in instalments by the congregation of All Saints Church, King's Heath.

THE North British Academy of Arts will hold the sixth exhibition of its members' works in the Picture Galleries of the Crystal Palace, Sydenham, London, S.E. The exhibition will open on November 1 and close on December 31. Admission will be free to visitors at the Palace. The N.B.A. has already held successful exhibitions in York, Burnley, and Newcastle.

MR. J. WILSON PATERSON, H.M. Office of Works, Edinburgh, has made an inspection of the ruins of the ancient priory at Whithorn, with a view to making the vaults watertight. The priory was erected in the twelfth century by Fergus, Lord of Galloway. The Government recently acquired two cottages in the burgh as a museum for the relics, &c., in connection with the priory.

THE death took place last week, at his residence, Great Stroatley, Hazelmere, of Mr. George Tunstall Redmayne, who was a brother of the late Mr. R. R. Redmayne and Mr. J. M. Redmayne, of Newcastle. The deceased gentleman, who was about 73 years of age, served his articles as an architect with Sir Alfred Waterhouse. Mr. Redmayne married a sister of Sir Alfred Waterhouse. She died some years ago. The deceased leaves two sons.

WITH reference to the proposed competition of plans for a Town Hall at Winnipeg, H.M. Trade Commissioner for Canada reports that designs for the building in question have now been invited by the Winnipeg Board of Control from architects resident in Canada. The estimated cost of the work is put at \$3,000,000 (about £616,600). H.M. Trade Commissioner adds that although it is probable that the contract for the erection of the building will be let as a whole, there may be opportunities for British firms to supply the necessary materials and fittings.

INTERIOR DECORATION.—III.

GREAT BRITAIN.—II.

By ALBERT E. BULLOCK, A.R.I.B.A.

(Continued from last week.)

FERGUSON, in his Introduction to the "History of Modern Architecture," endeavoured to show by means of parallels the influence of literature upon current art in different periods. It is generally recognised that literary change preceded a corresponding change in architecture, the fuller development of Renaissance work being very dependent upon the discoveries made abroad in the eighteenth and nineteenth centuries.

The sixteenth century had seen the masterpieces of Shakespeare, whose death in 1616 marks the close of a distinct style in architecture, to be immediately followed by the masques of the Court of James I. designed for the most part by Inigo Jones to the accompaniment of the satires of Ben Jonson.

The early years of the seventeenth century had not, however, thrown off all the trammels of Elizabethan influence, certain features of which prevailed well into the reign of Charles I. The decoration of Holyrood Chapel for the occasion of James's visit to Scotland in 1617 was followed in 1628 by the building of Heriot's Hospital, Edinburgh, which, although not completed until 1660, exhibits very few of the characteristics of the more advanced practice of the Southern architects.

From an extract of the Report of the Privy Council of Scotland for 1616 we find that his Majesty, having "gevin expres command and direction for repairing of his Majesties chappell within the Palice of Halirudhous with daskis, stallis, laftis, and otheris necessaris, in suche decent and comelie forme and maner as is agreable to his Majesties princelie estaite," and it having been found that "this work could not be gottin so perfyttlie and well done within this cuntrey as is requisite," therefore Sir Gedeone Murray, of Elibank, Deputy Treasurer, "with the speciall advise and consent of the Lordis of his Majesties Privie Counsall, hes conditioned and aggreit with Nicholas Stone, carvair, citienair of Lundone, for making, perfytyng, and upsetting of the saide worke within the said chappell, upoun payment to be maid by the said Deputie Thesaurair to him of the sowme of foure hundreth and fiftie pundis sterling, lauchfull money of England," &c. This was carried out in August 1616, and according to a footnote of the extracts of the reports of the following year the work was either superintended or designed by Inigo Jones.

A certain Matthew Goodrick, of London, was paid £200 for painting and gilding the work in the Holyrood Chapel decorations, which consisted of the wainscot work of Nicholas Stone ornamented with pictures of the twelve Apostles, the four Evangelists, Faith, Hope and Charity, including other religious representations, and finally a pair of organs costing £400, necessitating certain structural alterations to the fabric of the interior for their accommodation.

These things caused no small stir in Scotland, the people imagining that James was introducing Popery to the country, resulting in a petition being sent to the King to have the images removed, which was eventually granted, accompanied with "a sneer at their ignorant provincialism." There is no doubt that the high church views known to be held by the "Bishops Andrewes, Neile, Montague, and Dr. Laud," who came with the King to Scotland "to instruct them" in religious rites, frightened the simple ideas of the "Wee Frees," and the service which was held on May 17, 1617, in the English fashion, with a full choir, surplice and music, hardly coincided with their code of religion.

Inigo Jones, who was born in 1572, was the first English architect of note to travel and study in Italy. He was invited to the Court of King Christian at Copenhagen and returned with that King's sister, the wife of James I., to England, who appointed him her Architect and Inspector General of Royal Buildings. At the age of forty years he paid his second visit to Italy, and shortly after his return commenced the building of Chilham Castle, Kent, for Sir Dudley Digges, Master of the Rolls, who died in 1638. His monument in the church at Chilham is the work of Nicholas Stone. This sculptor was associated with Bernard Jansens on the tomb of Richard Sutton in the Charterhouse Chapel in 1615, and from 1619 to 1622 he carried out Inigo Jones' design for that portion of the famous Palace of Whitehall known as the Banqueting House—the scene of the execution of Charles I. The original designs for this Palace were published by Kent, and the second design made by Jones in 1639 by Campbell in "Vitruvius Britannicus."

Audley End was practically completed in 1616 by Thorpe and Jansens. The room known as the "Fish Room" (so named on account of the subjects modelled in the ceiling panels) is perhaps the last expression of this period of decoration, the doors and panelling below the frieze being later additions.

Apethorpe Hall, Northamptonshire, was in progress of erection simultaneously with the building of Houghton Hall, Bedfordshire, by Inigo Jones. The former was erected for Sir Francis Fane, Earl of Westmoreland. The original dwelling was of the reign of Henry VII., of which there are indications yet existing. Sir Walter Mildmay's chimney-piece bears the date 1562, but is obviously of later execution. Sir Francis Fane's additions were completed in 1623. The chimney-pieces in this house are of exceptionally good design, having details resembling some of the monumental productions of Nicholas Stone. The Library is later, probably of the time of the second Earl, about 1653, and exhibits the influence of the work of Inigo Jones as practised by his son-in-law, John Webb.

The Great Chamber of Gilling Castle, Yorkshire, has been previously referred to. The work here is late Jacobean, having lozenge-shaped panels, a pendant ribbed ceiling, and coloured ornamental frieze bearing numerous coats of arms in the foliage of the trees forming part of its decorative scheme, all of exceptional interest. The decorations of the other rooms are of later date, Mrs. Hunter's Boudoir being of Charles II. period with delicately modelled plaster panelled walls. The Long Gallery is after the manner adopted by Sir John Vanbrugh, and the wall decorations are a subsequent restoration by Crace in 1846. Still later additions have been made by Mr. Walter Brierley, of York.

Dorpfold Hall, Cheshire, was commenced in 1616 by Ralph Wilbraham. The house suffered from a siege during the Civil War in 1644 and was subsequently restored by Roger Wilbraham. The chimney-piece in King James' Room is dated 1621, and consists of a stone overmantel containing the coat of arms and motto "BEATI PACIFICI." The panelling is simpler than that of Gilling Castle, except in the great drawing room, where the treatment of the overdoor is a rather unusual feature.

The ceiling to this room takes a barrel formation with sharply moulded pendants and is ornamented with escutcheons, fleur-de-lis, the Scotch thistle, and other devices. The ceiling to the Library is later, probably about the time of the Adams chimney-piece in the same room. The staircase is Jacobean, having arabesque carved newels, carved balusters and string, the former being of wide spacing connected with arched fillings and key-blocks. The present owner is Mr. Henry Tollemache.

Aston Hall, Warwickshire, was erected for Sir Thomas Holt between the years 1618 and 1635. Mullioned windows are still retained. The pilasters on the panelled side are rather attenuated, the lower portion and the pedestal of each being carved in high relief apparently to obviate this defect. The panels are filled in with moulded arches and imposts. The building has been attributed to John Thorpe, but was probably completed after his decease.

Jesus College, Oxford, contains a room of late treatment with panelling of very rich design. The key-blocked ovals inserted in each panel have slight incised arabesque ornament. The panelling is divided in sections by fluted Ionic columns placed upon carved pedestals. The stonework to the window and fireplace is of Tudor pattern. The ceiling takes a more floral form than work of preceding date, and it may consequently be taken as a transitional example. The whole room is very effective, free from the conceits of the previous decade, and quite homogeneous in design.

At both Oxford and Cambridge there are numerous specimens of renaissance Art. The work of Theodore Have (or Havenius of Cleves) at Caius College, Cambridge, is noted for its originality, while Thomas Holt is cited as the architect of many colleges at Oxford. Archbishop Laud caused alterations to be made to the quadrangle and garden front of St. John's College, Oxford, about 1631 to 1635, upon which works the sculptor Hubert le Sueur is known to have been employed. There has always been some mystery as regards the identity of the architect engaged for this work, there being little foundation for the statement that Inigo Jones had any connection with it, while his co-adjutor Nicholas Stone was in continuous communication with Oxford between 1631 to 1637 during the erection of various works at Cornbury Park, near Charlbury, where he made some additions for Lord Danvers, and erected the three stone gateways now forming entrances to the Botanic Gardens (vide *The Architect*, Sep-

tember 3, 1909, p. 147, *et seq.*). The name of Timothy Strong has been preserved as the builder of the south front of Cornbury about 1630, which date coinciding with the period of Nicholas Stone's contract rather points to the possibility of Strong being engaged by Gabriel Staces for the work. Staces was Nicholas Stone's cousin and his agent at Oxford. He was associated with Hubert le Sueur upon the marble fountain at Old Somerset House in 1636. Later additions were made to Cornbury by Strong's son under Hugh May's directions, who visited the work with John Evelyn in 1664, and still more recently an extension has been made by Mr. John Belcher. Of Nicholas Stone's other work at Oxford there is little to add since it is chiefly of a monumental nature, as the delightful mural tablet erected at Merton College Chapel to Thomas Bodley in 1615, that to Hugo Barker at New College Chapel in 1632, and in 1637 the entrance porch to St. Mary's Church in the High Street. Dr. Fells, Canon of Christ Church Cathedral, Oxford, paid Staces £69 in 1632 for work there the nature of which does not transpire, the only monument traceable to the family being that erected to John Banks in 1654 by John Stone. There are other gateways and piers constructed by the elder Stone, as that for Beaufort House, Chelsea, in 1622, since removed to Lord Burlington's villa at Chiswick; the York Water Gate, near Charing Cross, in 1626, and the gate piers to Holland House, erected in 1629. He probably supplied chimney-pieces to Theobald's Palace when Inigo Jones made the alterations and additions there in 1623. He records in his diary having made a great number of chimney-pieces for important country seats. Of the six made in 1632 for Bagshot Lodge one is described as of Portland stone carved and inlaid with marble; others for Sir Robert "Spey," Sir Abraham "Dawas" of Putney, Sir John Beron of Hull, one for the King's Presence Chamber at Windsor Castle, also many other works there, and one for the Queen's Bedchamber at Old Somerset House of white marble, according to the directions of "Mr. Jones, Serveer of his Mt.'s workes." Stone sent a quantity of marble and stone for staircases, paving, &c., to various places, as the stone staircase of Hatton House for the "Rt. Hon. the Lady Elizabeth Hatton" in 1634, and a quantity of black marble work for York House, London, both places having long since disappeared. In 1636 he sent a quantity of material for paving the tennis court at Hampton Court Palace and the Queen's private chamber, and in the same year some stone to Oatlands Park, near Weybridge, where Inigo Jones was making preparations for the Queen's reception. He was engaged at Greenwich in 1637 with paving the terrace walk with Purbeck marble and the "Great Square Room" in the Queen's House there, which Inigo Jones designed.

The additions to Castle Ashby, Northamptonshire, designed by Inigo Jones, were carried out between 1627 and 1635, Stoke Bruerne Park, in the same county, being completed by Jones in 1634.

(To be continued.)

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

II.—PLANS.—VAULTING.—TRIFORIA.—CLERE-STORIES.—COLUMNS.

(Continued from last week.)

THE third example is Sta Maria sopra Minerva at Rome, the only pure Pointed church in that city, and one of the largest and finest built by the Dominicans in Italy. Here the piers show, in section, four half-shafts on a square core. The two longitudinal half-shafts sustain the pier arches, which, like those at Arezzo and Florence, are broadly Pointed, and of one plain order only. The half-shaft on the nave side of each pier is carried up, uninterrupted by the capitals of the shafts of the pier-arches, to support the transverse arches and the diagonal ribs of the domical quadripartite vaulting, which, as at Arezzo, is richly coloured.

The Gothic architect, after he had once perceived the kind of effect it was desirable to substitute for the Lombard expression (the Lombard construction having been discarded), found, almost ready-made to his hand, one of the most important means of producing it—namely, the Lombard ornamental column, with its base and capital, which in various ways expressed a total independence of constructive origin. There was, however, this difference between the Lombard shaft and the Gothic shaft—that the first was con-

structively superfluous, and expressed as much; whereas the last had really to take a primary part—to bear burdens, and yet appear to do nothing of the sort, the burden and bearing members being alike transformed into portions of the great vertical stream of piers, pointed arches, groined vaults, and vaulting shafts. As ages rolled on, the simplest way of obtaining this effect was to omit the capital altogether. It took some time, however, for architects who had always regarded a capital as the natural termination of a shaft to get rid of the tradition, and when at last they seem to have done so it was found that there were serious artistical objections to dispensing with it altogether. When capitals were totally omitted, as was often the case in Late French, Belgian, and German work, the eye became sensible of an unpleasant dubiousness as to the point from which the arch sprang, and when the moulded or many-shafted pier was the stem from which arose a system of still more divergent ribs and mouldings, the capital was needed to cover the junction of the two systems, its omission necessitating the very disagreeable alternative of the "discontinuous impost." Elaborate devices were therefore invented for denying and, as far as possible, reversing in their visual effects the nature of capitals as constructive members.

Ruskin condemned a large number of Gothic capitals as "unnecessary and ridiculous," because they have no "bearing power." Now it may be held that this expressed absence of any increase of power at the point of the capital is the only condition under which capitals could have been admitted into Gothic architecture, and that they are neither "unnecessary" nor "ridiculous," because they perform what we have seen to be the important function of marking the termination of the shaft or column and the commencement of the arch.

Another and a very good reason for the existence of capitals in Gothic architecture is one and the same with that which constitutes the merit of the horizontal channels under the Doric *ovolo*—namely, that they really add to the ascendant vigour of the members on which they occur by opposing to that vigour an obstacle to be conquered. Professor Freeman, whose remarks on some of the means of producing the effect of aspiration in Gothic architecture are particularly valuable, rightly said: "When there is no strife there is no victory; the vertical line cannot be called predominant unless the horizontal exist in a visible condition of subjection and inferiority."

Our Romanesque and First Pointed Gothic buildings were always full of shafts in doorways, windows, and clustered piers; our Second Pointed or Decorated buildings very rarely present us with distinct columns or shafts, though still giving examples of columns and shafts combined with other mouldings; while our Third Pointed or Perpendicular works, as a rule, present nothing but combinations of mouldings. The consequence was that the art of sculpture deteriorated in a parallel course. There is no place in which architectural sculpture can be more fittingly displayed than in the capital of a column. It is the most convenient, and at the same time the most conspicuous, position for it. It is, too, the most important feature in every design.

The gathering together of all the arch-mouldings into one, and concentrating their force before transmitting them to the ground, is the one point which ought to be emphasised above all others; and it is one of the strongest among the many reasons in favour of the thirteenth-century or Early Pointed style, and against the later varieties of the style, that in the one by the use of shafts with forcible and elaborately cut capitals this point was distinctly marked, while in the other by the disuse of the shaft and the constant practice of carrying the mouldings of the arch down to the ground without any interruption, it was determinedly ignored.

In this respect, therefore, above all others, Italian Gothic artists are entitled to our warmest praise. The love of variety characteristic of all good Gothic artists is conspicuous in their treatment of the column almost more than anywhere else. When they are plain cylinders, and not banded (and the band does not occur at all frequently), Italian columns, chiefly during the Romanesque period, taper slightly at both ends, as in the nave of San Sisto at Viterbo, and in many cloisters, though as to the effect of this there may be two opinions.

Of course, when the shaft is spiral, or when the occurrence of a band destroys the idea of continuity from base to capital, this is less common.

Among thirteenth-century examples of tall, plain cylindrical columns of great girth, those in the nave of Orvieto Cathedral are the most finely proportioned. They are tall,

built up of dark and light stone in alternately regular courses, and their capitals exhibit a variety of foliated ornament, combining boldness, grace, and vigour of execution. Some of the capitals have octagonal abaci, some square, others circular; but no regular order is observable. The bases are low, round in some cases, octagonal in others, and some are enriched at the angles with tongues of leafage. The respond, or half-pier, at the east end of the arcade on either side is especially beautiful, its corners being enriched from top to bottom with a continuous row of leaf-shaped ornaments, carved in light or dark stone, according to the colour of the layer on which each piece is imposed, the light being admirably contrasted with the dark.

Small circular shafts in round arched and Pointed Italian work are frequently inlaid. The tiers of arcades on the west front of Lucca Cathedral may be cited as the most charming examples of this mode of decoration. The shafts are white, inlaid with dark green marble; some are enriched with diaper-work, others are girt with a succession of simple chevrons, others with spiral lines, crosses, flowers, fleur-de-lis, foliated circles, and one at least with a succession of imitations of arcades, one over the other. In the building these shafts are frequently alternated with sculptured shafts, deeply cut with spiral lines of mouldings, occasionally adorned with sculpture of flowers, as in Giotto's campanile at Florence.

Octagonal shafts are of occasional occurrence, and a good example is seen in the shafts forming, with rich iron work between them, the screen round the high altar, at the junction of the nave, choir, and transepts of Sta Chiara at Assisi.

Spiral shafts are often richly inlaid with mosaic. One of the most beautiful of the many examples of this treatment is the monument of Pope Benedict XI. in St. Dominic at Perugia. Here the pillarets supporting the canopy of the tomb are of white marble, the spiral lines formed with a band and fillets, and at the base and neck of the shaft the heads are all connected together with vine-leaves carved in the spandrels between the little connecting arches. Small figures carved in the mouldings are filled in with glass-mosaic patterns in red, green, and blue on a gold ground.

The shafts in the tomb of Pope Adrian V. in San Francesco, Viterbo, and in Orcagna's shrine in Or San Michele, Florence, are of the same character, and they are of frequent occurrence in the best and richest internal work.

(To be continued.)

THE PHYSICS OF AIR IN RELATION TO VENTILATION.*

THE movement of air is affected by so many conditions and circumstances that it is, perhaps, impossible to design a system of ventilation which will automatically adjust itself at all times and under all circumstances. The most we can do is to provide the means (and they should be as simple as possible) for adjustment to meet all conditions, and to leave those occupying the building to make reasonable use of these means.

The object of this short paper is to draw attention to certain simple laws which govern the movement of the air, and to suggest that the best ventilation is secured by making the fullest use of them.

Dr. Shaw defines ventilation as consisting "in the passage of air into the space to be ventilated and out of it again, and the distribution of air during its passage through the . . . ventilated spaces," and we may add that in ventilation we seek to approximate the purity and constitution of air within a room to that which is supplied in such abundance outside. The problem is to do this without what is called draught, and a draught may be defined as a perceptible movement of air around the body. It becomes inconvenient and even dangerous when the temperature of the air is much below that of the body.

Now firstly as to the composition of air. We know that it is mainly formed of two elements, nitrogen and oxygen, uncombined, in the approximate proportion of 79 and 21; and that the latter is the active principle. Indeed, we may regard nitrogen as little more than a diluent, for pure oxygen would be too strong in its action. Its normal proportion in the air may be taken as the best adapted for the healthy action of the lungs, and any excess or decrease has an immediate effect upon that action. CO₂ is also present in the very small proportion of .04 per cent.

* Abstract of Paper read before the York Congress of the Royal Sanitary Institute by A. Saxon Snell, F.R.I.B.A. (Fellow).

It may be assumed that pure air has no constituents which will spontaneously change its essential character, or render it poisonous to us. It may, however, be polluted by external agents, and it is the vehicle of these agents. Even the .04 per cent. of carbonic acid, which is present in fresh air, is not in itself poisonous. Its action is merely negative. If the proportion is increased by the combination of carbonic with free oxygen, it leaves the air proportionately the poorer of so much oxygen. Its main importance is due to the fact that it is also an index of really deleterious matter in air.

By ventilation, therefore, we seek first to remove the surplusage of CO₂ and replace it with oxygen. Practically we do this by constant dilution with fresh air, and for efficiency this dilution should keep down the proportion of CO₂ to .06 per cent. It is generally accepted that for this purpose it is necessary to introduce 3,000 cubic feet of fresh air per hour for each person in the room. We have also to remove the excess of moisture with which every expired breath is charged.

I do not propose to discuss the question of moisture in air, important as it is, and I will only note that generally speaking it is essential for comfort, and that the amount necessary has been fixed at 70 per cent. of the total amount which can be held in suspension at any particular temperature. As to whether moisture is necessary for health is another matter. It is too complicated a question to consider now.

In the second place I would refer to the question of temperature.

We cannot treat ventilation and heating apart: they must always be considered as two parts of one subject, but we must beware lest acceptance of the proposition without qualification leads, through misconception, to error.

Heating should be used first and foremost as a corrective to the effects of ventilation on temperature, and on occasion as an aid or stimulant to movement of air.

In the next place we come to the movement of air, and it has by far the most important bearing upon ventilation. In a general way we can safely say that air is always in movement. The difference between apparent stagnation and a wind current is one of degree only.

The causes of movement are ascribed to the two forces of diffusion and convection, and of the two the latter is by far the more powerful. In all schemes of natural ventilation it is mainly relied upon. Diffusion is slower and more feeble in its action, and, as a consequence, I think it is too often neglected as a factor in ventilation; but it goes on, nevertheless, and can be made use of with good effect.

Given any volume of air, a change in temperature in one part immediately produces movement. The colder part being the denser at once descends by the force of gravity, and in doing so pushes up the warmer and lighter air. This is called the "law of convection," and, Dr. Shaw points out, it is the dominant physical law of ventilation. He emphasises it by several illustrations, showing how much more powerful it is than any movement induced by mechanical means. Realisation of this law is absolutely essential for any proper understanding of the process of natural ventilation.

Changes in temperature may be produced in a room by many causes. When the air is heated it expands though not to any great extent; and in so doing in a closed space causes a state of "plenum." With an outlet available, the extra volume is released and equilibrium restored. The air left behind is still lighter than the outer air, and if an opening is made in the wall between them, the latter will by force of gravity enter and displace the former. Thus, we have two natural forces to assist us in the removal of heated air. I take no account of a third, the action of the wind; because the problem of ventilation should not depend upon so variable a force. Necessarily, with one opening only, both incoming and outgoing air will be considerably throttled, and the interchange slow.

With two openings, one at top and one at the bottom, the lower one would act as an inlet, and the upper mainly as an outlet. There would then be comparatively little throttling, and we should obtain something approaching continuous movement of air in the room. But cold air at the floor level and warm air above would mean for the occupants of a room cold feet and hot heads. The reverse is to be preferred, but the law of convection forbids. We can, however, effect a fairly successful compromise by placing inlets between the top and the bottom of the room (in practice about seven to eight feet above the floor line), sheltered with hoppers to give an initial upward current to the air. The momentum of the incoming air is sufficient to direct the

stream towards the ceiling, until it is overcome by the force of gravity, when it falls gently through the warmer air. In its fall, it is met by the rising warm air, through which it filters downward, absorbing in its passage a little of the heat of the rising current. It will gather more heat from the bodies of the occupants. Every such accession of heat of course retards the tendency to fall, and in time reverses the current. Indeed, as Dr. Shaw found by interesting experiments, the current is almost immediately reversed upon coming in contact with warm bodies. Nevertheless, the bulk of the air will in the absence of heat, at or about the floor line, continue to fall. Arrived at the floor line it will spread laterally. Theoretically, there it should remain in the absence of any access of temperature sufficient to cause it to rise again. That is not desirable, but, on the other hand, it should not be allowed (or at any rate be forced) to ascend again, because in doing so it would have a tendency to carry with it fine particles of dust gathered at the floor level. Therein lies one of the virtues of the ordinary open fire, which induces a strong current of air at or about the floor level.

We all know and have suffered from that strong drag of air along the floor, so powerful is the action of an open fire, and to counteract this a separate supply of air is often brought in at the fireplace to feed the fire, a practice which appears to me to be of doubtful value. It must be remembered that these distressing floor draughts are not caused by the air which is drawn down from the ventilators, but comes direct from the outside of the room under doors and at window openings. The remedy is to close up these direct inlets at the floor level and to open the ventilators or windows wider.

Notwithstanding the powerful drag of an open fire, a certain part of the air will rise when its temperature is raised by contact with warm objects in the room. In larger rooms, too, it is necessary to supplement an open fire with radiators round the walls, and these also warm the air and thus lift it from the floor level; but I doubt the advantage of placing ventilating openings behind them.

Now let us follow up that part of the air which is expelled from the lungs and given off from the bodies of the occupants heated and contaminated. The law of convection causes it to rise towards the ceiling. As we have seen, the incoming fresh air in its descent absorbs from it some part of its heat, but in general not a sufficient amount to materially retard its ascent. Arrived at the ceiling, it will spread laterally, and there it would remain until sufficiently cooled by the incoming fresh air or other causes, to be carried down again towards the floor.

Now obviously it is undesirable to allow this contaminated air to fall again, and we should have an outlet or flue at or above the ceiling level to help it to escape into the outer air.

If it is not drawn off at a sufficient rate, part of it comes in contact with the comparatively cool surface of the outer walls or windows, and as a consequence loses so much heat that the current is reversed downwards and close to the walls. Dr. Shaw suggests that under these circumstances air outlets should be provided at the level of the window-sills. With all respect to so undoubted an authority, I cannot help thinking that in practice the system would not work. Under conditions which obtain more often than not in this country, these outlets would become inlets.

Perhaps the best method of counteracting this tendency is to have an arched ceiling with the highest part at or along the centre, with an aspirating flue or flues at the highest part. I have adopted this system with the best results in hospital sick wards, more or less upon the lines first suggested, I think, by the French architect, M. Tenon. Even a considerable coving will help in this direction.

I have a great reliance upon an effective extraction shaft, and by effective I mean one which can be relied upon to act as such at all times. A most satisfactory extraction shaft can be obtained in connection with a good and continuously used smoke flue. At Charing Cross Hospital I constructed one over 100 feet in height along the boiler shaft, and separated from it by a thin partition, and it helped me to ventilate the basement and sub-basement storeys in an effectual manner. You will no doubt remember that a heated shaft of great height plays an important part in the famous system of ventilation for the Houses of Parliament.

Another method is to have cross-ventilation by openings or windows in opposite walls. With these we obtain perfilation, or a current of air travelling right across the room at a height which will not inconvenience the occupants, and which is generally powerful enough to sweep away the rising contaminated air in its course. Such currents of air are not entirely dependent on wind (indeed, air should not be driven

across the room from one side to the other by the force of wind). They are due, I think, rather to the fact that there is always a difference in temperature (greater or less according to circumstances and aspect) between one side of a building and the opposite. It may be that the sun has warmed the walls one side more than the other at a given time, or that there is, for local reasons, a quicker movement of the air on one side or the other. Or again, that a strong current, blowing towards the building, may cause a slight vacuum on the opposite side. But, whatever the cause, the perfilation thus secured is a valuable ally in ventilation.

The adoption of this principle in schoolrooms is, at the present time, a matter of controversy; and it is perhaps well to add that it may be easily discredited if it is not used with discretion. It would be absurd, for instance, to have windows open on both sides in a gale of wind. In such a case the lee-side should be open to a much greater extent than the windward side. On the lee-side there would be a slight vacuum, which would assist perfilation.

I have referred to the law of diffusion; what part, or to what extent it plays a part in ventilation has not, I think, been fully investigated. Dr. Shaw dismisses it as "a modest assistant of the more powerful convection." The late Mr. W. T. Sugg gave me, many years ago, some interesting particulars of the manner in which he made use of this law for ventilating large rooms. I suppose it is familiar to all of us, but I may describe its action briefly.

If a closed space is filled with two gases of different specific gravities, the denser will naturally sink to the bottom, in accordance with the law of gravity; but in a short time they will mutually diffuse, the heavier gas passing upwards and the lower downwards, until the two are mixed both above and below the gauze. If a piece of gauze or other porous substance be inserted between the two, this diffusion will take place rapidly. Following this law, and assuming that the air inside a room is at 70° and that outside at 40°, if an opening is made in the wall and fitted in with gauze or any fine mesh screen, the cold air will pass into, and the hot out of, the room, and rapidly enough to give good ventilation. The fineness of the holes through which the air passes breaks up a solid stream of air outside into an infinite number of small streams inside, and so obviates draughts. Mr. Sugg told me that he had used this method with considerable success in billiard rooms and public halls. Obviously there are possibilities in the law of diffusion.

Perhaps inevitably I have been led to discuss methods of ventilation instead of confining myself to the physical laws which govern them; but these methods, regarded as illustrations of the effect of laws, help to explain them.

In the discussion on Mr. Saxon Snell's paper Dr. Evans (Swansea) said the paper dealt with causes and not with results. It was air starvation that the people were suffering from. In the Private Bill which the Swansea Corporation brought before Parliament this year they had a clause requiring that every building used for public purposes should be properly ventilated. He got little help from the committee, however, because the Local Government Board advised that the clause should be cut out, and as a matter of fact he was not allowed to give evidence.

Mr. S. H. Davies (York) said he approached the question from the point of view of the chemist, and in York he had had the opportunity of making a large number of air tests in connection with schools and factories, and he did ask that architects should be generous with regard to their testing of air. Architects had to design rooms not simply from the point of view of ventilation, but there were other considerations which governed them, and he would like to ask Mr. Saxon Snell what he would do with deep rooms which could not be dealt with by window ventilation. If they trusted entirely to window ventilation in a big room, especially in a factory, they were bound to have a very extensive heating area. They knew that many schools had been designed which were ventilated by windows only. In the Staffordshire type, for instance, they got cross ventilation, but there were many schools built in which they could not get that cross ventilation. One means adopted for securing ventilation was the heated airshaft. He thought architects ought to come and see these things afterwards, and find out how they worked, and very often they would find the air flowing in the opposite direction. In the case of a York school he had suggested putting a powerful fan at the base of the chimney, thereby absolutely promoting a forced draught. There was also the Plenum system, and he had found in rooms he had tested that from the CO₂ point of view they did get an advantage from the mechanical system. But in the Plenum ventilated school, if the teacher opened a window in a class-room there was a direct loss of air in every other room; but by having

flaps over the inlets and outlets in the room in which the window was opened they could get over that difficulty. He thought that architects should co-operate with chemists in this matter.

Mr. Saxon Snell, in reply, said he cordially agreed that the architect and doctor and chemist should co-operate in such a matter. The great trouble where there were so many complaints about defective ventilation was that only one had been consulted. The architect who thought he knew all about such things put them in without understanding the seriousness of the matter. He was afraid that in many cases the doctor with little knowledge of construction but with many fine ideas about ventilation would make equal failures. His advice to younger members of his profession had always been that the person who was going to live in a house was the person who knew what he wanted, and in the same way if he was designing a school or a public building he would go to the people who had to administer it. The great thing was to understand what the actual requirements were. In all those technical questions of ventilation and light they wanted the co-operation of men who had studied them, and certainly with regard to ventilation the chemist's knowledge was very desirable. He was asked what he would do in the case of a factory building, and he had already said that abnormal buildings required abnormal treatment. He would include a badly designed building as abnormal. He was not saying that mechanical ventilation was not good; but his view was that they should not design buildings which required mechanical ventilation. In the Staffordshire schools the point was dealt with. In the old central hall type of schools they could not ventilate properly, and the Plenum system was tried with a good deal of success. But do what they would with mechanical ventilation, it could not be so good or so economical as natural ventilation.

CHURCH ARCHITECTURE IN NORTHAMPTONSHIRE.*

(Concluded from last week.)

In certain churches during the first half of the thirteenth century there was developed, as in the fenland district, a love of rich detail and in particular of elaborate and deeply-undercut foliage. Warmington and Polebrook are some of the most beautiful and attractive examples of the richer side of that stage in development which our forefathers called the Early English style.

But even at Warmington and Polebrook the general character of the design is simple, and decoration is lavished only on certain parts of the building where it is thought to be appropriate. The thirteenth-century arches of the south arcade at Polebrook, following the semicircular outline which was slow to disappear in this shire and the neighbouring county of Rutland, are merely chamfered; and it is impossible to point to a Northamptonshire church of this century which is treated with the attention to moulded arches, foliated capitals, and flower and leaf sculpture in the hollow moulding of window arches and jambs which is distinctive, for instance, of the church of West Walton in the Norfolk marshland. The wall arcade in the north transept at Polebrook is a beautiful piece of work, and fellows to its slender shafts may be found in the external arcades of the towers of Higham Ferrers or Raunds; but its deeply-undercut mouldings and its sculptured hood-mould stops are hardly typical of local thirteenth-century work. It may be seen, both in this arcade and in the moulded doorway of the same church, how the stone of which they are composed has a tendency, if too deeply undercut, to split or break at the edges. And it was largely this fissile character of the ordinary local building-stone which determined the course which Northamptonshire church architecture took during the thirteenth and fourteenth centuries. If undercutting was attempted on a large scale there was danger of spoiling a good deal of stone before the desired result could be achieved. Thus after 1250, when the general epoch of enlargement and rebuilding set in, the characteristic notes of Northamptonshire mason-work are dignity of design and economy of decoration. It would be hard to imagine, for its date, a more pleasant interior of a church than that of Sudborough, in the valley between Brigstock and Lowick. It is entirely of the half-century between 1250 and 1300.

Although the details of such churches are plain, the stone

is of the best quality: the builders have spared nothing which serves to emphasise the various divisions of their plan and endow them with an architectural as distinct from a merely decorative character. The properties, then, of the local building stone are responsible for a type of mason-work which aims at a general effect of architectural dignity by means of bold and simple lines and curves, and subordinates, though it does not wholly dispense with ornament. There is, I need hardly say, much elegant and imaginative detail to be found in these churches in minor features, such as the corbels which do duty as responds at Aldwinkle All Saints and Wadenhoe, in small hood-mould stops and similar architectural adjuncts all over the county; but this detail, if it has variety, is generally composed of very simple elements. The nature of his material caused the Northamptonshire mason to throw all his strength into the structural element in his building, and the result is a singular purity and precision of design.

Nowhere is this more conspicuous than in the towers and spires which from the thirteenth to the fifteenth century are the glory of the county. I believe that in Northamptonshire the western tower began gradually to supersede the central tower about the beginning of the thirteenth century. At Raunds we find a feature derived in the first instance from Rothwell and Higham—the thickening of the western wall of the tower and the consequent introduction of a shallow porch on the ground floor in front of the west door. This design continued to be in favour in this neighbourhood for many years, and appears in the much later western towers of Oundle, Rushden, Keystone in Huntingdonshire, and one or two other churches. Raunds also displays to perfection a feature which, again, is one result of the peculiar qualities of the local stone. The stone which lends itself badly to the sculptor's chisel is easily split up into thin slabs for roofing purposes, and thus the spire, as in South Lincolnshire, and again in Leicestershire, is developed to an unusual degree. At Raunds and Stanwick—the latter, with its octagonal tower, perhaps more curious than beautiful—we have spires which are doubtless an integral part of the original design, although at Raunds there was probably some delay before the spire was added. In some churches, as at Woodford, the spire is a fourteenth-century rebuilding; in other cases the tower had to wait until the fourteenth century for its spire. The octagonal spire, with broaches at the angles of the tower and without a parapet, remained the favourite form of tower-roof in Northamptonshire until the beginning of the fifteenth century.

Another and more thick-set type of broach spire with heavy pinnacles on the broaches, which recalls a well-known Oxfordshire type—namely, at Bampton-in-the-Bush and Shipton-under-Wychwood—found its way to Wellingborough about 1250. There are other spires of the same character. It seems likely that it is an importation into Northamptonshire. The general design of the spires at Woodford and Denford in the Nene valley appears to be controlled by the same influence.

In the fifteenth century the ordinary parapeted spire occurs in many instances of great beauty. Rushden and Kettering are surpassing examples of this type—Rushden in refinement, Kettering in boldness of design. A handsome type of tower with long belfry windows in pairs on each face came into fashion in the fifteenth century in the high-lying country south of the Welland, between Lutterworth and Northampton. Less ambitious in design is the modest type of fourteenth-century tower at Holdenby. The lofty and plain fifteenth-century tower at Towcester and the splendid tower of Titchmarsh near Thrapston are without local relations; the isolated character of the Titchmarsh tower may remind us of the tower at Great Ponton, near Grantham, and equally alone in its district. Disproportionately tall angle pinnacles, without octagonal lanterns, occur at Easton-on-the-Hill and Collyweston, near Stamford. At Nassington and Wilby the spire rises from an octagon imposed upon a square tower—a design of which there is an earlier example at Exton, in Rutland. I cannot help thinking that this tower and spire at Exton—one of the most beautiful things of its kind in England—may have created a strong impression on Northamptonshire builders; for another of its peculiarities, its octagonal angle-turrets, is reproduced at Oundle and Kettering.

At Geddington is a tower whose angles are clasped by square buttresses of small projection, with very slight diminution by means of offsets. Such buttressing is common in the Kettering district. Of towers and spires in the south and south-west of the county there is not much to be said. A plain and lofty type of fifteenth-century tower, as at Cogenhoe, Castle Ashby, and Stoke Bruerne, was common

* An abstract of a Paper with lantern illustrations read on July 24 by Mr. A. Hamilton Thompson, M.A., F.S.A., at the Summer Meeting of the Royal Archaeological Institute at Northampton.

south and south-east of Northampton in the old deanery of Preston, while south-west of Northampton are a few saddle-back towers.

A lavish use was made in the Nene valley churches of the local ironstone in alternation with the light-coloured oolite of the neighbourhood. Much of the ironstone has perished, and in modern restorations walls and arches have often been repaired in light-coloured stone of one kind; but in the interior of Irthlingborough, in the north aisle wall at Earl's Barton, and, above all, in the tower of Rushden, we are able to appreciate the effect of colour introduced by the means of ironstone, and to see how the contrast supplies much of that light and shade which in other districts is produced by the elaborate contrast of round mouldings with recesses of deep shadow. The re-use of old material often presents some perplexing problems. This careful economy in preserving and disposing of old material is much against any theory of wanton destruction of twelfth-century work by thirteenth and fourteenth century builders. At Towcester, indeed, where the present very lofty nave arcades appear to have been heightened twice, the late twelfth-century capitals of the early arcades have been raised with the columns. Where the arcades were adequate, as at Warmington, later builders left them as they were; at Towcester and at Rothwell, where they were too low, they were altered, but as much of the old work was kept as was possible.

The general characteristics of fourteenth-century work in the county are in the natural course of development from the characteristics to which I already have called attention. The mouldings of this period, in which convex forms are freely grouped together without intermediate undercutting, had been anticipated by the local methods of moulding in the thirteenth century; and the Northamptonshire masons of the first half of the fourteenth century gave excellent proof of their inherited skill. The handsome church of Finedon, with its large transepts, its chancel planned for vaulting, and the wide arches of its nave carved with plain sunken chamfers, is an example of a style in which the traditions of Raunds and Irthlingborough are worthily carried on; while in the parallel chancels at Higham Ferrers, built between 1320 and 1330, the harmony between the later and the earlier work in the body of the church, the natural derivation of the one from the other, is readily appreciated. In one point, however, there is a slight decline. In the second half of the thirteenth century, doubtless in order to minimise the risk of spoiling too much stone by unsuccessful carving, the stone for the window tracery was cut, as a rule, in very small blocks, and thus a beautiful type of miniature geometrical tracery, with small openings and figures of delicate outline, was produced. It may be said to have reached its height about 1280-90. On the other hand, it is by no means general. At Raunds, again, the east window is of a normal geometrical pattern. The fine tracery of Thorpe Malsor illustrates that escape of geometrical figures from the restraining bond of the circle which led in course of time to the free curvilinear treatment of tracery. The transition from geometrical and conventional to curvilinear and naturalistic forms appears in the east window of Wellingborough Church, and fully developed curvilinear work appears in the west window of the north aisle at Castle Ashby and in the west window of the nave at Irthlingborough—one of the most perfectly satisfactory windows of its date which I can remember. But, as a rule, the favourite tracery of the fourteenth-century masons in these parts was of the form usually called reticulated. In Northamptonshire there are many examples, of about 1270, of windows in which the mullions are simply curved to meet the enclosing arches, so that the tracery is formed by their intersections. This is common in all parts of England, and in Leicestershire, Nottinghamshire and Derbyshire it is even more common than in Northamptonshire.

The great period of church architecture in the county was the second half of the thirteenth century, and no group of fourteenth-century churches in Northamptonshire can compare with the great Lincolnshire group east and south of Sleaford—Swineshead, Heckington, Ewerby, Helpringham, Swaton and Billingborough. Nor is there much in Northamptonshire that can match the fourteenth-century work which, west of Sleaford, appears in the beautiful chancels of west Lincolnshire, Nottinghamshire, and Derbyshire—work which has close analogies in the East Riding and in a somewhat remote part of the North Riding of Yorkshire, and had its origin, as I believe, at York itself. One member, however, of this group of chancels appears in the Nene valley at Cotterstock. The Daventry and Towcester districts have not much fourteenth-century work that calls for comment. When we come, however, within the sphere of Oxfordshire influence, at Byfield and Middleton Cheney especially, we are

in a district the excellence of which in design of this period is not easily surpassed.

At Fotheringhay is the most splendid example of fifteenth-century design which, the "new building" at Peterborough apart, the county has to show. To enter at all fully into the history of the art of the latest Gothic period in Northamptonshire would be to repeat much that applies equally to other English counties.

Mural paintings, stained glass, screen-work have all some claim upon the visitor to Northamptonshire, and of wood-work of various periods the church of Ashby St. Ledgers furnishes a rich supply. But, in conclusion, I would dwell not on these adjuncts to architecture, but on a point to which fuller reference is necessary. The chancel at Harleston was built at the expense of the rector, and the materials for the new nave were found by such inhabitants as could afford them. Each, that is, took his legal part in the work of repair. We find again and again in guide books and in attractive books for tourists allusions made to the monks who built the parish churches, or to the generous emulation of abbots which owned advowsons or appropriated rectories in the work of erecting churches in which they were thus interested. As a fact, monks did not obtain license to convert the great tithes of parishes to their own use in order that they might spend the proceeds in building churches. Where they were lords of the manor, as the abbot and convent of Peterborough were at Polebrook, they took their part in providing the nave, and may have built it at their own expense. Where, as at Castor, they were both lords of the manor and rectors, their responsibility to the fabric was larger. Where, as at Geddington, they were merely rectors, they were bound to the upkeep of the chancel, but generally arranged the vicar's stipend so that he came in for his substantial fraction of the expense. Their attitude to their responsibilities in this respect was—and no practical archaeologist who knows the value of money will blame them—as cold and critical as that of their legal successor, the average lay rector of to-day. The abbot and convent of Croyland were forced in 1383 to repair the decayed chancel of Wellingborough: the chancel of the fine church of Harringworth bears evidence, in the hasty and inferior masonry of its upper walls, of the desire of the abbess and convent of Elstow to save as much as they could of the money which they were obliged to spend on a church which none of them had probably seen. The visitations of religious houses by Bishop Alnwick, as reported by his secretary Colstone, contain many references to the decay of the chancels of appropriated churches. And these facts, although they are familiar to many, are in danger of being forgotten. Of the churches of the Nene valley, the majority at the time when most of the present fabrics were built were served by rectors, while the manors were largely held by laymen. The splendour of most of these fabrics must be put down to the munificence of rectors such as Richard de Het and lay-folk such as Henry de Bray; to the combined action, as at Lowick, of John de Heton, the rector, and Ralph Greene, the squire; to the wealth of such merchants as John Pyel, the founder of the college of Irthlingborough. And I think that, in remembering the ready action of the laymen of the day in this matter, we are also justified in assuming that, while the greater churches, especially when monasticism was at its zenith in England, exercised a powerful influence over the development of architecture, yet at the time of which I have been speaking the work of building our parish churches was entrusted to skilled local masons, familiar with the general architectural tendencies of their day, but guided in their individual work by the local material to which their hands had been trained.

Traders' Needs.

SIR,—I find, as an old trade journalist, that commercial men are determined that Parliament shall next year, by way of a change, seriously consider what burdens on trade can be lessened or removed, and how trade can be fostered instead of repressed. To aid this cause I am editing a threepenny book which will detail not only the laws which injure trade, but also the full needs of all classes of trader. And in order to make the book complete I solicit suggestions from your readers, provided that these be non-partisan, commerce, and not party, being my sole concern.—Yours faithfully,
27 Chancery Lane, W.C.: S. J. SEWELL.

FORTHCOMING EVENTS.

<i>Saturday, September 7.</i>
Architectural Association Camera, Sketch, and Debate Club : Walking Expedition, start at Dorking.
The Institute of Sanitary Engineers : Visit to Central London Railway Power Station, Shepherd's Bush.
<i>Saturday, September 14.</i>
Northern Architectural Association : Visit to Sunderland.
<i>Wednesday, September 18.</i>
Sanitary Association of Scotland : Annual Meeting at Montrose (four days).
<i>Saturday, September 21.</i>
Architectural Association Camera Sketch and Debate Club : Week-end at Malden, Essex.

RURAL BY-LAWS.

WE are glad to learn that the persistent and well-founded criticisms and objections against the present by-laws affecting building in rural areas have resulted in the issue of a circular by the Local Government Board, which gives the opportunity to District Councils to modify their building regulations to a form more consistent with common sense, and tending to render possible the provision of cottages in rural districts at a price which will enable land owners to supply the needs of villagers at a rent that wages in the country will permit, without inflicting serious loss on those who build.

The circular of the Local Government Board says that it has been alleged that, particularly in some rural districts, the requirements of the by-laws exercise an unduly restrictive effect upon the erection of small dwelling houses. There can be no doubt amongst architects and others who have experience of building in the country that the allegation is well founded.

The circular further goes on to lay down the principle that by-laws are intended to operate in the interests of the inhabitants, and that it is obviously undesirable that the by-laws in any area should offer any ground for the suggestion that they are unnecessarily restrictive and obsolete in character. There cannot be a shadow of doubt that the existing by-laws in many localities are both unnecessarily restrictive and obsolete.

The subject-matter of the by-laws with which the circular first deals is that of construction, and it is pointed out that new methods of construction and design will almost inevitably demand periodical revision of by-laws. The earlier by-laws were framed with particular reference to brick construction, and imposed restrictive conditions as to the thickness and the use of materials; therefore, they are inappropriate to types of construction now in use such as building with hollow blocks or slabs of terracotta, concrete, reinforced brickwork, or reinforced concrete. The older by-laws in many cases do not provide for hollow and half-timbered walls and steel-framed walls, walling with tiles, slates, &c., filled in where necessary with incombustible materials.

Thus the Local Government Board directs the attention of District Councils to the many new methods of construction, which have for their object the lessening of the cost of building. Granted that they may not be of so permanent a type as brick-built walls of regulation thickness, but cottages are not necessarily intended to stand for a couple of hundred years, and sufficient permanency may be obtained without detriment to health or danger of fire; indeed, it is possible that improved methods may give us even more permanent and more healthy dwellings than those built in the stereotyped fashion.

Another important section of the by-laws is that dealing with the width and construction of roads, and here the influence of the Garden City movement and the lessons which have been taught by the leaders of that

movement have induced the Local Government Board to recognise that cheaper roads than the usual by-laws prescribe are amply sufficient for the necessities of many districts and areas, and will be even better adapted to enhance the health and enlarge the amenities of the district.

The local authorities are advised to reconsider the treatment of their by-laws already in force, so that the improved conditions of Garden Cities and Garden Suburbs may be obtained.

In this way very considerable impetus will be given to Garden City planning, inasmuch as it has been conclusively shown by Mr. Raymond Unwin and others that, given the possibility of cheaper roads amply sufficient for their purpose, the limitation of the number of houses per acre to a healthy maximum becomes a profitable policy for the land owners.

After dealing with construction and road-making, the Board's circular refers to the desirability of greater flexibility in the administration of the by-laws, thus recognising that no matter what by-laws are made there should be provision for the relaxation of the stringency of their provisions when circumstances arise to render this advisable.

The circular of the Local Government Board, therefore, opens the door to much-needed improvement; first, in the drafting of by-laws suitable for a particular district instead of being based upon cast iron regulations, which were intended originally for urban building; and second, in the possibility of a common sense, give-and-take administration of such by-laws as are enacted, thus recognising that circumstances vary, and improvements in the construction of buildings and of roadways are continuously being made.

It is with regard to the second of these improvements that we fear there will be the greatest difficulty.

It is an easy thing to find men who can act as building policemen simply to see that the law is carried out strictly in accordance with the letter, and many of the so-called surveyors who are at present entrusted with the carrying-out of the building by-laws in rural districts and who are supposed to devote all their time to that duty for very modest salaries, although perfectly capable of doing what is now required of them would be scarcely men of sufficient experience and sound judgment to administer by-laws on a give-and-take basis.

They are quite capable, for example, of seeing that a 14 inch wall has three courses of footings and a bed of concrete of a specified thickness and width beneath it; but if they are asked to approve a bed of concrete without the footings, although it would obviously make a better support for the wall, they would in many cases scarcely be able to form a correct judgment as to what width and thickness that bed of concrete should be.

Since the old Metropolitan Board of Works has been superseded by the London County Council as the authority

SPECIMENS OF WORK DONE IN THE TRADES' TRAINING SCHOOLS' WOOD CARVER'S-SHOP.

for carrying out the Building Acts in London, there has been a change in the policy of selecting and appointing district surveyors, which illustrates the difficulty we foresee with regard to the administration of rural by-laws. The district surveyors of old used to be and some few still are architects in practice of good position, and in addition to their own business superintended the administration of the Building Act in their particular district, but now the modern district surveyor is an official who devotes all his time to policing building law in the area in his charge.

The old-time district surveyor was to a considerable extent independent of the income from his district, and regarded this as supplementary to his practice. The modern official is wholly dependent on the fees of his office, and dare not, therefore, risk censure or deprivation by the exercise of his judgment in permitting any departure from the letter of the law, although such departure might not vitiate its spirit, but feels that he must adhere strictly to the actual wording of the Act he administers, even though it may involve absurdities in compliance.

So, also, has it been in the rural districts. The surveyors are men who stick to the literal interpretation of by-laws, because that way only safety lies for them. If the administration of rural by-laws is to be given more elasticity as the Board's circular suggests, that elasticity can only be imparted by the judgment of architects of sound knowledge and experience.

It would be difficult to at once get rid of the officials who have been appointed, and the only way that we can see by which the desirable consummation can be effected is by the institution of a means of appeal to selected architects in private practice, who would have the power of permitting reasonable departure from the letter of the by-laws.

There are now all over the country a number of architects in practice who are especially conversant with the needs of their particular districts, and amongst them can readily be found men of sound judgment to whom the appeal could safely be entrusted. The present surveyors could still be retained as policemen, whilst the practising architects would act as magistrates in building law.

It would, of course, be advisable, if not necessary, that the architect who acted as magistrate should be debarred from private practice in the actual area of his

jurisdiction, just as were the old-time district surveyors of London. If the districts were made small there would be no hardship in this.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WHEN we prescribed a water-colour drawing as the subject for the holiday month of August, we did not anticipate the phenomenal downpour that has been experienced this year. The fact that there has been too little sun and too much water to render colour enjoyable, or even observable, is probably the cause of the small response that has been made to our invitation this month. Had we anticipated rightly the weather we would not have chosen as subject the exterior of a building. Our stipulation that the drawing was to be on a large scale has apparently been read by some of our contributors to mean that it was to be made to scale.

"Plato" has sent a drawing of the west doorway of Magdalen College Chapel, Oxford, in which the colour is well handled, but which suffers from a picturesque point of view, and also as a record by the elevational character of the presentment.

"Alpha" has sheered clear of too diagrammatic a rendering in his drawing of the central portion of the south front of the Jesus Hospital, Newcastle-on-Tyne, but his colouring suffers from a too rigid adherence to the conventional purple shadow. The picture lacks strength and richness.

"Chelt" has made a real water-colour sketch of a Tudor courtyard at Hampton Court Palace, and has attained a fair amount of skill in handling his brush, but there is a lack of harmony in the key of his colouring. The greens, the reds and the purples do not synchronise in tonality.

"F. M." has quite mistaken the subject, and sends us a coloured elevation, and conventionally coloured at that, of a front of the Almondbury Conservative Club. When we ask for a water-colour drawing we want a representation of architecture from a pictorial standpoint, and desire more emphasis on the water-colour than the drawing.

We have decided to award a prize of one guinea to "Chelt" and half a guinea each to "Plato" and

SPECIMENS OF WORK DONE IN THE PLUMBER'S SHOP.

"Alpha," but as the drawings are not suitable for reproduction without spoiling their effect, we shall be unable to follow our usual practice in this respect.

TRADES TRAINING SCHOOLS.

THE Trades Training Schools, which are maintained at Great Titchfield Street, London, by the Worshipful Companies of Carpenters, Joiners, Painter Stainers, Plaisterers, Tylers and Bricklayers, and Wheelwrights, are continuing to do excellent work, as would appear from the report of the judges on the examination of the productions of the various classes during the past year.

The trades for which classes are held, and on which reports have been made by the judges, are those of carpenters, joiners, masons, painters, plasterers, plumbers, smiths, stone carvers, tilers and bricklayers, wheelwrights, wood carvers, and electric wire men.

There is besides a life class in which modelling is done by craftsmen of the trades in which the production of artistic forms is a necessity.

It is unnecessary for us to quote these reports in full, as they all show that good work has been done, in many cases an advance has been made, and in a few there are openings for further improvement, which have been pointed out by the judges.

The report of the Director, Mr. H. Phillips Fletcher, deals with the work of the current session, and enumerates much of the work which is in hand.

It is evident from these reports that the classes are appreciated by the craftsmen for whom they are intended, and in many cases they are as full as the space available in the schools will permit.

The prizes for the past session were distributed by Lieut.-General Sir Robert S. S. Baden-Powell, K.C.B., K.C.V.O., when he gave the following address, which contained much wise appreciation of the spirit that animates and makes successful the Trades Training Schools of the Worshipful Companies of London.

Lieut.-General Sir Robert S. S. Baden-Powell said: Mr. Chairman, Ladies, and Gentlemen,—I come here, not to lay down the law, to praise or blame, but I come rather as a student, and certainly as an admirer of the students in these schools, because I know myself the value of handicrafts and craftsmanship on a higher plane than the mere earning of a livelihood. I believe this kind of work is the best character-making ingredient that we have in our methods of education (hear, hear), and I am longing, like many others, to see

our country keep up her reputation as the country for character. The nation that has the most character is the one that is going to win in the battle, or race, or competition for success in the world, because the life of a nation is very like that of an individual.

Take any individual from the lowest beginnings—he does not succeed in life because he learnt his A B C, his arithmetic, or his writing better than his neighbour at school. It is not always the clever fellow at school who gets on, it is the clever one outside the school, the one who has the character for thoroughness in doing his job, for sticking to his work when things look bad, for having the pluck to carry things through, and for having reliability. We want to keep everyone of our men with character in them, and then our nation will stick in its place in the competition of modern days.

I have just been learning a lesson in character from your Chairman, when he was entertaining me at dinner. He was telling me of his own father, how he had made his way through difficulties at the beginning. He forced his way through and came out on top, and died as an old man in prosperity and in honour, having made his own way in the world without a helping hand. It is an inspiring example for men to make their life and career a success. I believe this training school that you go through develops character in a man, and will make for more than mere monetary success. It will cause his ultimate career to be a real success, before he passes out of this life. I have had a great admiration for craftsmanship all my life. I have tried being a craftsman, and thoroughly enjoyed it; and I have known the fame of British craftsmanship. I have travelled a good deal and seen the work of foreigners, and I know how good they are in certain things; but they have not the imagination, they have not the self-reliance and adaptiveness in them which one finds in the British-born man. I only hope that we may keep up the same spirit and attainment in the rising generations. Of course, machinery and civilisation rather tend to put men in one groove, and to take away from them that heart, that imagination and interest in doing their work thoroughly, which they would otherwise have.

Character and craftsmanship have pulled me out of a tight place, for at Mafeking, with which you probably associate me best (applause), you may remember we had to hold out against a large number of enemies with a handful of men, none of whom were trained regular soldiers. They were almost all working men, and the most useful of them were our handicraftsmen, the railwaymen in the workshops. They did a tremendous lot of useful work

B

SPECIMENS OF WORK DONE IN THE STONE-CARVER'S SHOP.

behind the scenes, which enabled the men in the front to hold the place properly. I have given a lecture on this subject before engineers, merely from an engineering point of view, but there is one little point I can remind you of—namely, that we made our own gun, and our own ammunition. When you start to make a gun out of nothing and ammunition out of less (laughter) you can understand what the difficulties are, unless you have British handicraftsmen to do it. The difficulties did not daunt them. They knew we wanted a gun, so the first thing they did was to tear out a steam pipe from an engine, and make that the bore of a gun. Then they took down some iron railings; they heated them up, welded them on, and wrapped them round this steam pipe to strengthen it. They took a second lot of rails and wrapped them round and shrunk them on, and bound them in place by castings made of brass, and then brazed on a big block of brass at the butt to make a breach. The trunnions they rove on, and eventually made a very formidable-looking gun indeed. When they mounted it upon the wheels of an old thrashing-machine and started to fire it, the order was "Everybody take cover." Several times it went off all right, but it suddenly went off at the wrong end (laughter), and blew the breach out. We then put on a pair of hinges, and tried to make a breach-loader, but it blew the hinges off. We then fixed ropes from the muzzle to the breach, which effectually held the gun so that it could not burst any more.

We next had to manufacture ammunition—we had to make gunpowder. Our chairman comes from a place where they teach officers in the Army how to shoot rifles and how to make gunpowder. I was there many years ago, and we learned our work theoretically rather than practically. We did not have to make gunpowder, but we were taught all the different handicrafts that we should have to use and the different processes which bring them into touch with each other until gunpowder is produced. We remembered these processes by a little sentence, "Many men use fresh dirt"—the initial letters of those words meant the different processes. M stood for melanite, and the M in "men" stood for mixing. (Laughter.) "Many men use fresh dirt." What the "u" in "use" stood for I never could remember. I was hauled up for this letter "u" several times. First of all, we made our charcoal. It ought to be made out of willow wood, but we made it out of gum trees. There was not much sulphur in the place—no mines there: though some people said it was "a hell of a place" we had no sulphur—(laughter)—but we got sheep dip, and that did very nearly as well. We dried it out and got the sulphur out of it, and so we went on.

It was by these fellows turning their handicrafts and their resources to account that we actually managed to make our own ammunition. When the enemy fired their shells into us, we took them and melted them down and made moulds, and converted into fresh shells the proper size for our own gun. I think the blast furnace we manufactured was a sight for sore eyes. (Laughter.) We took the cistern out of the roof of a house and lined it with the fire-bricks out of a locomotive. The channels through which we pumped the air were made from the Westinghouse brake pipes. We jacked up the old locomotive, set the wheels going round, and so contrived a fan, which blew a fierce blast into our home-made furnace, and it worked perfectly well. (Applause.) Now, that gun you can see any day in Whitehall, with the shells we manufactured, and it is a good example of what men can do with good craftsmanship, putting their minds into their work. Not merely taught by rule of thumb, but thinking for themselves, they can turn their hands to anything which a crisis demands. I am very pleased indeed to see that your training here encourages this spirit, and if a man shows genius in any particular direction he can develop it instead of being tied down to certain forms and rules which must be adhered to.

I admire you men greatly for going to the schools and improving your knowledge during your own time and at your own expense to try and make yourselves better craftsmen than you were before. It is going to tell on the nation in the future, when men take up their work in that spirit. I can assure your master, who was kind enough to allude to the Boy Scouts to-night, that in the Boy Scout training we do not go in much for military work, but we do go in for handicraftsmen and handicrafts. I attended a little time ago an exhibition of work done by Boy Scouts in Bermondsey. They had a splendid exhibition of the things these lads had done in trying to make themselves good craftsmen, and some of it was very good work indeed. They were, like you, training themselves up to be handicraftsmen outside their ordinary work in the schools or workshops, and thus, without knowing it, forming their own characters. A fellow who can strike out a line for himself is forming his own character, and he makes a good character; he cannot help it. A great many of those boys, by going in for different kinds of handicrafts, develop good habits, and it stands to reason that there will be precious few of them loafing about a public-house or at street corners with their hands in their pockets. (Applause.) They have all got some work to do in the world, and this gives them more and more interest in life as they go on, and a more satisfactory life it is in the end.

Now, we hear a great deal said against soldiering, and I know it has its bad points in that it tends to make a man too

much of a machine. It is necessary for each man to be good individually and to use his own initiative, so we do not want to make him part of a machine. At the same time, military training is a very good discipline for a man. Through it he becomes loyal, carries out his orders because it is his duty, and learns to become what is really of practical value, a good citizen. I was in a big factory in the North some time ago, and I was surprised to hear from the manager, who was not a soldier himself, that he would not take any man into his factory except those who had had military training, because he found that they always did a little more than they were paid for—(laughter)—and you will do a little more than you are paid for if you are the men I take you to be. They are accustomed in the Army to earn their money. Soldiers, as you know, in peace time get their 1s. 3d. a day, and reckon that as their pay and work up to it. They do their drill, the barrack square routine, they learn their shooting, their riding, how to clean their boots and buttons, and many other things. But when they go on active service they forget all about their pay, they still get the same amount, but they risk their lives for it. They will pull a comrade out of the most dangerous position, they mean to rescue him though it cost them life or limb, and they do it because they have got the right spirit in them, the spirit of the true soldier, loyal to his officer, loyal to his pal, and loyal to his country, and they do a little more than they are paid for. It is very fine to see them carry that same spirit with them when they go back to civil life. They are accustomed to doing something more than they are merely paid for, and they take a pride in their job. In this case the test came, not long ago, in the time of the strike. The strike had nothing whatever to do with that factory or the work carried on there; but some of the strikers, pleased with their success, went to the workshops and said: "You men have got to come out." Well, those fellows looked out from inside and said: "If we come out it will be to duck you in the river. Go along and play, we are busy here." (Laughter.) And they went on with their work and continued to be busy.

That is what pleased the owners. They found the men were ready to stick by them in a crisis, and the men knew that their employers were ready to stick by them in times of poverty. It was "give and take" on both sides, and doing just a little more than they were actually paid for. I have travelled a good deal abroad, and although I love the foreigners and have a great affection for them—we have got Boy Scouts in pretty nearly every country under the sun—yet I cannot help recognising, and they do too abroad, that in British work there is a certain amount of extra good quality which goes beyond what the men are actually paid for doing. The workmen abroad put in very good work, but they do not put in more than they are paid for. In British manufactures, as a rule, you get good quality, which is only gained from the fact that the men take an interest in their work; they take a pride in it, they would be ashamed of anything shoddy. They put extra good work into it and turn out a good article. It carries through in all lines of life: we should all do a little more than we are paid for. There is a tremendous lot of voluntary effort and keenness throughout the country. You fellows who are going out into the world as good craftsmen, I hope will remind yourselves sometimes to put an extra effort into your job; because it is a noble thing to carry out good work, and in doing so you will be doing a great thing for your own character, for those who use your work, and for the reputation of your country. The line you have taken up now is splendid: I hope you will stick to it in the way you have begun. I thank you very much. (Applause.)

HOUSES PAST AND PRESENT.*

In choosing as a title for my address to you to-night "Houses Past and Present," I was fully conscious that the subject could not be completely dealt with in any single lecture or course of lectures. I had not even any immediate intention of talking about houses at all. I felt merely that there were certain things connected with building which I wanted to say to you, and the title of my paper seemed to be one which, while I could not exhaust it, would at least give space for some discussion. If I ever become wise enough to be a professor, I should like to be a professor of "Things in General," for I have always found it impossible to separate the various activities of man into watertight compartments.

And this activity of house-building depends on so many other things. Its consideration raises at once questions with reference to education, the ritual of daily life, and many other matters.

In the modern world, it seems to me, house building is not taken seriously enough as a subject of art. Now, as I believe that art should find (as it has in the past always found) its main expression in the building of houses, which is man's way of decorating, or disfiguring, the world we live in; and as I think it does not matter so much what we put in our picture galleries as long as our streets are full of living art, I will ask you first to consider the houses of the past, by which I mean the houses built in those dark ages of old England before people became sufficiently enlightened and sufficiently educated to build the modern Board school and to live in the modern jerry-built suburban villa.

It is a subject one feels more inclined to dream and meditate over than to speak about; for no words, no words of mine at least, can hope to do more than faintly suggest to you the beauties and peculiar charm of these old houses. The genius of man has found its expression in many forms of art, in great pictures and in great musical compositions; but to my mind pictures and music, much as I appreciate them, seem but shadows compared to the realised conception of a house.

It is a living actual thing: a dream (it may be a nightmare) translated into the very stuff of the world itself. It surrounds and envelops us with an atmosphere which becomes a part of our daily lives, intimately interwoven with all that we do and all that we think. This is much; but a beautiful house means much more even than that. Since the measure of the joy it gives us is but the sum of the joy which its makers have expressed in creating it, it implies the existence of man the creator, instead of man as the factory hand. It does not connote the division of the industrial world into the two opposing camps of Capital and Labour: the driver of the machine on the one hand, and on the other, man, with all those infinite possibilities of his degraded by a system which makes him a cog in a machine. Instead of all this, it postulates a world of craftsmen, of artificers, working in the spirit expressed by Kipling's lines:

"Who, lest all thought of Eden fade,
Brings Eden to the workman's brain,
To, Godlike, muse o'er his own trade,
And, Manlike, stand with God again."

It was the noble part of such a company as this Carpenters' Company to foster and encourage that pride and joy in creative work which was the mark of the old craftsman. It was concerned not so much with a minimum standard of wages as a minimum standard of work, and it seems to me that the chief need in the industrial world of to-day is to study the spirit and methods of our old trade guilds and seek to reconstruct some such system in the training of our craftsmen, to give them back that lost heritage of theirs—those deep and satisfying joys which good work alone can give. And the net result of this system in the past was their old houses, which we have lost the art of producing.

Before we consider them a little more closely, I should like to insist that in studying old houses we must not be content to be merely archaeologists, and to make nice distinctions between Jacobean work and Elizabethan. Nor must we be too much concerned with those salient features which were but the passing fashions and frills of a period. We must go deeper than that, and try, if we can, to fathom the heart of the mystery of the old house. What is the secret of its elusive charm, and what can we learn from it to make our building better here and now? Let that be our central object in considering the old house.

If we study it carefully, we shall find the first lesson we have to learn from it is the absolutely vital importance of building technique. It is not too much to say that the whole of our modern methods and ideals of building are wrong artistically, and we touch here the very root and centre of the failure of modern work. We architects may make beautiful designs on paper—we may make sketches which look quite fascinating—but when you see these designs interpreted by the modern high-class builder you must end by sorrowfully inscribing "Ichabod" over the doorway, for all the glory has departed—all the gilt has been rubbed off the gingerbread.

Go to such an old house as Haddon Hall, for example. Apart from the various architectural features which were but passing fashions, where does the root of its beauty lie? Is it not in mere building? Every square yard of its masonry is full of interest and vitality and subtle variety.

* A Paper by Mr. M. H. Baillie Scott, read at Carpenters' Hall.

And what is the principle that underlies it all? We hear a good deal of talk nowadays about texture, as if that were an end in itself instead of a result of right principle. And the principle appears to me to be that building should be an education of materials. And just as the ideal human education is that which evolves all the best in the individual, instead of levelling all to the uniform standard of the particular school, so the ideal education of a material consists in shaping it to its place in the structure with only such sacrifice of its individuality as its function there demands. That was always understood in old work. In modern work the desire for mechanical accuracy has led to the obliteration of the characteristic qualities of materials. I have spoken of this matter here before, but it appears to me to be so absolutely vital that I feel bound to repeat myself. In this education of a material, then, I mean that the work done in it should help to express those of its qualities which are peculiar and unique. A brick should look like a piece of burnt clay—a bit of mother earth, moulded to man's ends, but still of the earth, earthy; stained and marked, it may be, in its ordeal by fire. As such it is much more than a mere coloured rectangle. We can read its whole life story in its form and surface.

A comparison between the methods of the past and present in building discloses all the difference between a living art and a dead formula. Take, for example, the treatment of a floor in an old cottage. You will not find it done by rule. The joists will be full of character. Their outlines will have the slight undulations suggested by the grain. They will not be exactly straight, or exactly level. You may go in a dozen cottages, and each will vary in treatment. There will also be pleasant undulations in the plaster, and nowhere will you find the brutally rigid, mechanical outlines of the modern room. Turn to any modern text-book on building, and you will find no hint conveyed to the student that construction is anything else but a dead and trite formula. Joists—mere scantlings without any possible kind of interest—are shown there, placed 15 inches apart from centre to centre, and below these the inevitable plaster ceiling, with its badly-designed moulded cornice and so on. There is no suggestion that the whole art of building begins in the placing and shaping of its materials in such ways that the characteristic beauties of each are drawn out. You will not find a line to suggest that building is an art at all, but it is presented as a peculiarly dismal science. Building thus being made a dead letter, our architects are reduced to conceal the poverty of essential building by all kinds of histrionic superficial adornments. Just as in the modern stage we are driven to conceal the absence of real acting by all kinds of stupendous productions to deafen and confuse the observer, so in modern buildings we seek to split the ears of the groundlings by buildings of vast scale. And the people are duly impressed, and if the judicious grieve, after all they are in the minority.

The next vital principle we may learn from the old house is the principle of relation. By which I mean that the beauty of anything is not so much intrinsic as relative, and the beauty of a building depends on the reciprocal relation of its parts to one another, and then to the relation of the whole to its surroundings. This principle is well understood in modern art in a detached and disjointed way. The painter, within the confines of his frame, understands it, but not beyond that limit; and so we have in the modern picture gallery the last word in the confusion of the arts, where there is no general atmosphere of related harmonies, but only a wild jumble of competing individualities. The art here, however good it may be, has no definite place in an ordered world, and no relation to a great scheme of things.

How different was the old way, when pictures were wall decorations and part of a social order! For, just as the proper conception of a society is one which embraces and finds a place for each human being, however humble, so in the world of art we want an equally all-embracing conception centred in the house grouped in definite relation to other houses and to Nature, and adorned with art which claims no individual and detached existence, but owes its chief beauty to its harmonious relations to surroundings.

In the country house this principle of relation will find itself chiefly expressed by the connection between the house and Nature. It is in this respect mainly that the modern country house fails. Let us have another glance at Haddon Hall. As you approach it it appears so much a part of the wooded hill on which it is built that it is hardly noticeable, and then a nearer inspection seems to show, in the technique of the building, a close harmony with Nature. It would seem almost to have been created by the same hands which

made the trees and hills, or as if some inspired conjuror had placed there just the very building that the imaginative would have demanded. If we next consider the houses which we architects build in the country, shall we not generally find that, however well designed they may be in themselves, they leave us with the impression of a cockney importation from the town of the latest developments of architectural thought there? Especially is this the case with the formal eighteenth-century scheme now so much in vogue. This has its place in the sun, no doubt, and there are natural sites which seem to demand just this kind of house built in the old sympathetic way. But when you come across one of these formal schemes in a Surrey wood, with a few ragged pines in the front garden, it makes the whole of its natural surroundings appear to want grooming.

If what the painter feels about a wood is expressed in the picture he paints, if what the poet feels about it is expressed in the song he sings, so the architect's commentary on its beauties should be expressed in the house he builds there. It should be sylvan, romantic, and as much at home as the nests of the birds are. To encounter, in such a place, the modern country house of the usual type is to experience much of the same feeling of repulsion that the remains of a picnic convey. But, after all, the woodland villa can do little more than prick its ears above the trees which screen it. What shall be said of the modern house on the open hillside? Here you may observe perhaps one of the latest and sweetest things from the garden suburb—what is technically called a "repeat order"! Its original did not look so bad in the garden suburb, but here its little gabled prettiness seems out of place. And so it would seem that here, too, as in the wood, some inspiration must be sought from Nature, and some hint taken from those old local buildings which always seem to express so well the spirit of the places they beautify.

Houses in windswept, open spaces near the sea and on exposed hillsides alike seem to demand a certain ruggedness of aspect. They should look like hardy outdoor open-air creations, and not seem to demand protection from the elements; and inspiration for buildings in such positions might well be sought from the old castles, which seem to add so much beauty to wild and rugged places. By level pastures and slowly-winding rivers, the personality of the house may become more kindly and gentle, and the less rigorous outlines of timber and tile take the place of the more austere qualities which belong to rugged stone and slate.

(To be concluded.)

THE drawing by Mr. Albert E. Bullock, A.R.I.B.A., illustrates the author's series of articles on "Interior Decoration," and the subject is described on page 139.

RIPON CATHEDRAL: THE SEDILIA.

THIS is a very unusual and interesting example of the mingling of two different styles. It is supposed to be fifteenth-century work, although the ogee arches point to much earlier times. The mouldings of the shafts are very shallow, and the detail of the capitals is late, while the work in the canopies is early, which almost leads one to suppose that the sedilia was not entirely built but only restored in the fifteenth century. It formerly stood in the next bay of the choir west of the present position, where it was removed in 1868, when the cathedral was restored by Sir Gilbert Scott. The gables and pinnacles are new work. The piscina is now in the floor (as shown on plan), and the piscina recess is used for the chalice. A curious feature about the sedilia is the series of grotesque figures on the underside of the ogee canopies. The drawings, by Mr. E. H. Gibson, here reproduced, were awarded a prize in *The Architect Students' Sketching and Measuring Club*.

SIR THOMAS BROCK, R.A., has been commissioned by the Belfast Committee in charge of the *Titanic Memorial* to prepare a design and execute the work.

THE Royal Sanitary Institute have published particulars of their fifty-fourth course of lectures and demonstrations for sanitary officers. Part I. opens on Monday, September 16, and Part II. on Friday, November 15.

INTERIOR DECORATION.—III.

By ALBERT E. BULLOCK, A.R.I.B.A.

GREAT BRITAIN.—II.

(Continued from last week.)

TISSINGTON HALL, Derbyshire, built by Francis Fitzherbert (about the time of Charlton, Kent), is a good instance of clear-cut panelling with Ionic pilasters to the drawing-room, the hall panelling being somewhat exceptional in having the panels carved with intersecting arches to each bay in the manner of the Early Norman arcading, only plentifully supplied with key-blocks. The plastering appears to be rather later.

The staircase of the Strangers' Hall, Norwich, is a transitional example, having square and turned balusters with pendants and string carving of early influence. The hall was originally built in the sixteenth century by Nicholas Sotherton. It was owned in 1612 by Francis Cock, who built some additional rooms and the staircase upon his accession to the Mayoralty in 1627.

There are several examples of the period at Cambridge, notably Bishop Williams' additions to St. John's College in 1623, the library door of which is flanked by pilasters having arabesque filling. The archivolt over the door head is ornamented with shields carved with the Tudor rose and fleur-de-lis, with carved angel heads in the spandrels. At Clare College the bookcases, or "classes" as they were then called, are panelled in the Jacobean manner, and the cresting is of the type known as floriated strapwork, although it is an early Charles I. example executed in 1627. A mural tablet in the ante-chapel of Peterhouse College, dated 1632, exhibits similar influence, and is given in Mr. Henry Tanner's book entitled "English Interior Woodwork."

Raynham Hall, Norfolk, erected by Inigo Jones in 1630, is executed in that bold style associated with his name. The hall forms a noble entrance for an English gentleman's residence. The ceilings here and in the saloon differ from the work of the Jacobean period in being of bolder ribbed formation, the full modillioned cornice returning around the inside of all the coffered and sinkings. A feature which is typical of the work of Inigo Jones and was adopted by his followers appears first on the frieze of the Banqueting House, Whitehall, in the form of a female head flanked by two festoons. This is the motif of the frieze in the hall at Raynham. Another detail of significance is the triple husk ornament frequently seen on the consoles of chimney-pieces and occasionally incorporated with the design of plaster friezes. This latter was a favourite with William Kent, who made frequent use of it at Rousham Hall and in the cabinet room at Houghton Hall.

The chimney-piece in the library at Apethorpe, an addition of the seventh Earl of Westmoreland about 1730, contains the same motif.

In the basement of No. 65 Lincoln's Inn Fields there is an early chimney-piece, which is probably a survival of the original house erected in 1658-9 by William Hodges, having features in common with those in the dining-room and the saloon at Raynham.

The decorative scheme adopted in the hall is based on Classic principles, and presents a very dignified appearance. Plain Ionic pilasters line the walls, carrying a fully moulded and modillioned entablature, over which is a clerestory with enriched panels, and containing on one side windows to light the room, which is 50 feet long by 25 feet wide. The doors giving access to the various rooms have simple pediments, the doors themselves being of polished hardwood. These doors and the pictures are the only portions of the room of a darker hue, the wall being finished with a flatted white tone. Of the other rooms the red drawing-room and the dining-room have the principal ornaments of the plaster work and the chimney-pieces picked out in gold. The ceiling of the saloon is a particularly fine composition. Queen Anne's Bedchamber, an equally dignified room, is hung with tapestries. The original windows were probably casements with leaded lights; the openings were subsequently filled in with modern sashes, the introduction of which was much later in the century.

Stanway House, Gloucestershire, was commenced the same year as Raynham Hall, while the Royal Palace at Kew, a brick-built house, contains ceilings modelled in 1631.

Old Somerset House occupied Inigo Jones' attention from 1632 for many years, and was eventually removed to make way for Sir William Chambers' noble structure.

The Ambassadors' room at Knole was added in 1635, the

year of the commencement of Westwoodhay House, Berkshire. The Barber Surgeons' Hall shared the fate of Old Somerset House, and in 1638 Inigo Jones made additions to Kirby Hall.

Wilton, Wiltshire, was some eight years in building, being designed for Philip, the first Earl of Pembroke (Lord Chamberlain).

This building is the finest expression of the Italian manner of Inigo Jones, and still remains one of the most complete examples of his work, which was not confined to the house alone, but extended to the grounds, which are laid out with great care for architectural fitness.

The room illustrated by means of the accompanying measured drawing is known as the "Double Cube room,"* owing to its dimensions, being 60 feet long by 30 feet wide and 30 feet high. The drawing given by Campbell in "Vitruvius Britannicus" places the chimney-piece centrally, but this has been shown by Messrs. Triggs and Tanner in "Some Architectural Works of Inigo Jones" to be erroneous. The ceiling panels were designed for family portraits by Vandyke, which were omitted. The swags and other ornaments are made in a species of composition and applied.

The whole scheme is carried out in white and gold. The adjoining room, known as the "Single Cube room," is similarly treated. Some designs for the ceilings at Wilton are contained in the Worcester College collection. For a room of its size it is the most successful treatment ever adopted, giving a palatial effect, which feeling is carried out in the remainder of the residence. The work was superintended by John Webb, the kinsman of Inigo Jones.

The pulpit of All Hallows Barking distinctly shows the influence of the work of these men, especially in the swags and wreathed linen ornament. The work was executed in 1638, and was evidently the outcome of the advice given in 1634 by Nicholas Stone, for which he records having received a "rondell of canarie wine (28s.)." The font cover here is a later work of great beauty, either by Cibber or Gibbons.

Ashburnham House, Westminster, is attributed to John Webb (born 1611), the pupil of Inigo Jones, but he more probably finished it from the designs of the master, the interior being of great scholarly refinement, which we do not find with Webb's work executed immediately after Jones' death. The building is in excellent preservation, and is notable for its fine ceilings and especially the staircase, which has the distinction of being occasionally emulated by modern architects.

Inigo Jones was engaged on Lindsey House, Lincoln's Inn Fields, and Coombe Abbey, in Warwickshire, in 1640. Swakeleys, near Hillingdon, Middlesex, has a close resemblance to Raynham externally, but the interior is mostly of some decades later. There is a certain charm about the screen at the end of the hall, although built of wood and stucco, and polished to resemble marble. It formed one of the additions of Sir James Harington.

The original house was built by Sir Edmund Wright in 1638. The dining-room panelling dates from about this time. The saloon ceiling, with its fifteen panels, so closely resembles the ceiling of the staircase at Coleshill that it might reasonably be assumed to have been designed by Inigo Jones. The whole room is panelled in a very quiet and chaste manner. The walls and ceiling of the grand staircase were painted by Robert Streater after Sir Robert Viner purchased the house in 1665 from Lady Harington.

Robert Streater was born in 1624, and studied under Du Moulin. He excelled in decorative painting, and has been extolled for his work at the Sheldonian Theatre, Oxford, where some of his best examples remain. Whitehall gives the following couplet in praise of this artist:—

"That future ages must confess they owe
To Streater more than Michael Angelo."

However this may be, he had his followers in the personages of Verrio, Laguerre, Ricard, and Thornhill. He was constantly employed by Sir Christopher Wren at the New Theatre and the chapel of All Souls, both at Oxford, the ceilings at Whitehall and at St. Michael's, Cornhill. He also painted the house of Mr. Povey, the friend of Pepys, at Lincoln's Inn Fields, and the cedar dining-room at Sir Robert Clayton's house, where he painted the subject of the Gyants war, since removed to Marsden, near Godstone. At Kensington Palace his paintings to the staircase, guard chambers, &c., were executed in 1692 for £3,599.

Claydon House, Middle Claydon, Buckinghamshire, is an early seat of the Verney family, whose genealogical tree runs

* See Illustrations.

back to the fifteenth century. The house changed hands in the sixteenth century, having been leased to a kinsman of the name of Giffard for a term of 100 years. Before the expiration of this lease in 1620 Sir Edmund Verney bought out the tenants, but does not appear to have carried out many alterations there. Much of the present house and decorations date from the time of the Adam Brothers, and will be dealt with in describing that period. The house is very sumptuously finished, exhibiting, however, that want of unity and repose associated with so many of the old mansions of England which have had periodical additions, the interiors of which suffer from the eclectic offshoots of different styles, regardless of any harmony.

Several houses in the parish of St. Giles-in-the-Fields date from about 1640, of which Lindsey House and Newcastle House, both on the west side of Lincoln's Inn Fields, are probably the most notable. From volume III. of the "Survey of London" it appears that the first-mentioned was apparently a speculation of Sir David Cunningham's, who was the rector of Old Charlton Church, and a great friend of both Inigo Jones and Nicholas Stone. When the latter erected the tomb to Sir Adam Newton at Charlton church, Kent, in 1630, he recorded the name of his patron in the following terms:—"For ye which my very nobell friend Ser David Cunningham payed me £180." The church, by the way, is worthy of note, being an early renaissance building with a brick tower and semicircular nave arcading on Tuscan formed pillars. The pulpit is an excellent example of the joinery of early Charles I. origin, while, in view of the friendly connection above referred to, and the fact that Inigo Jones had a house in the locality, it is possible the design may be traceable to this source.

In 1641 Sir David Cunningham sold his house at Lincoln's Inn Fields to Henry Murray, one of the Grooms of his Majesty's Bedchamber, who in turn sold it to the Hon. Charles Rich in 1652, in whose family it remained until 1664. It then passed through various hands, until it was sold to Robert Bertie, the fourth Earl of Lindsey, in 1704, by Lady Holman, from which time it has been known as Lindsey House. The original building was designed, as previously implied, by Inigo Jones, and had in front six rusticated piers capped with vases (of which piers only the two outside ones, connected with the party fence walls, now remain). These piers were filled in between with wrought-iron work forming a screen. The house was subsequently divided into two, and numbered 59 and 60. The alterations then made naturally sacrificed much of the interior decorations of Inigo Jones' design. The alcove in the front room on the ground floor and the chimney-piece in the back room of No. 59 are probably additions by Isaac Ware after the alterations carried out under his direction in 1752.

Newcastle House, Nos. 66 and 67 in the same Square, also formed together one house originally, being erected on the corner site by William Hodges. The Earl of Powis employed the Dutchman, Captain William Winde, to rebuild the premises after the fire of 1684. In 1693 it became the official residence of the Keepers of the Great Seal, and Sir Christopher Wren was commissioned to carry out the decorations, for which work he employed one Abraham Jordan, a carpenter. In 1705 it passed into the possession of the Duke of Newcastle whence the name of the house was obtained. The decorations of the interior are mostly of the type invented by the Brothers Adam. Part of the ceiling of "the Peacock room" and a chimney-piece of a room on the second floor date from the earlier occupation.

During the Civil War there was very little progress in building works. In 1642 Nicholas Stone assisted Inigo Jones to bury his fortune. The year 1647 marks the deaths of Huntingdon Smithson, Nicholas Stone, and his architect son, and the birth in Holland of Grinling Gibbons. Two years later the Commonwealth was established.

At Coles Farm, Box, Wiltshire, there is an interesting ceiling and frieze dated 1649. The additions to Forde Abbey and the building of Coleshill, Berkshire, mark the close of the career of Inigo, who died in 1652.

The additions to Cobham Hall, Kent, are probably the work of John Webb, who completed the staircase at Coleshill after the death of Jones. The staircase ceiling has the usual treatment of modillioned cross beams with an oval centre and laurel wreaths in the eight surrounding panels. The cornices are all heavily enriched, especially that to the hall.

Webb executed some additions to Drayton House, Northamptonshire, for the second Earl of Peterborough in 1653, the chimney-piece in one of the state bedrooms being from his designs.

(To be continued.)

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

III. — ARCHES.—WINDOWS.—TRACERY.—STAINED GLASS.

(Continued from last week.)

THE Greeks, who, if they did not invent, at least perfected the several orders of architecture, never in later times seem to have sympathised at all with the Roman modification of them, most of which were consequent on the use of the arch. Their Byzantine art owes but little to Rome. It was, in truth, a genuine invention of a style developed out of the Greek, but one in which the arch was an essential feature, and in which the cornices and mouldings, the columns and their capitals were all modified to suit it.

Their decoration was almost entirely Eastern, both in its *motif* and in its mode of execution. Their development was a radical one; for in place of the old Roman and old Greek construction of plain walls and columns carrying only a dead weight, Byzantine art is remarkable for the extent to which it treated construction in a new fashion, as an affair of weight and counterpoise. This was provided for in the arch and pier, in the dome and its supports. The Roman basilica required no great scientific skill for its erection, whilst the Byzantine buildings dealt with some of the most difficult problems of construction, and really adumbrated the triumphs achieved in such scientific and delicate constructions of the Middle Ages as Amiens and Chartres, Rheims and Westminster.

Between the time of Constantine and Charlemagne the Roman buildings were not passing through any development. The long series of popes, from the beginning down to the time of Charlemagne's conquest in the seventh decade of the eighth century, had done more in the way of conversion of existing buildings, or robbing antique temples of columns and what-not for use in their new basilicas, than in attempting to erect new buildings exhibiting any new school of architecture. The basilica, with its long ranges of columns, ending with a throne or an apse, supplied all that was needed for Christian worship, and the multitude of old fragments available led for ages to the construction of buildings in which the whole of the details are antique, and in which the general form is founded also on an ancient one.

The long ranges of columns and arches of all sizes and sorts are often very imposing, but the interest of such churches is rather archaeological than architectural. The interest of the fragments of which they are constructed is great. They sufficiently evince the slovenliness of much of the Roman work of the period, but at the same time the freedom from all such rule as the exact dimensions, proportions, and decorations of the various orders. It is not too much to say that no two capitals in one of these churches are alike, whilst the remains are, with few exceptions, of Ionic, Corinthian, and Composite, and not of Doric. As an example of this, San Pietro at Toscanella, near Viterbo, may be adduced.

In all the Italian work, evidently founded, to some extent, on the Gothic buildings of the north, such as Florence, Orvieto, and Siena, the arch mouldings are invariably a repetition of those on the jambs, the capitals being treated simply as imposts; and although the system has been reprobated, one fails to see why such abuse should have been showered upon it. Where the arches are stilted, the usual springing is marked with true artistic feeling, only by a small subordinate moulding of thin detail, often forming a base or plinth to the arch mouldings.

The feature which most marks all Italian Gothic is the indifference to the true use of the Pointed arch. Everywhere arches were constructed which could not have stood for a day had they not been tied together with iron rods. There was a great lack of that sense of all the unities of art which made a northerner so jealous to maintain the proper relations of all parts of his structure. Even in Nicola Pisano's works the arch moulding rarely fits the capital on which it rests.

In comparing Italian with Northern Gothic, the student cannot fail to notice the difference in the windows, not only as regards their relative frequency and size, but also their architectural character. In the great northern churches the architects delighted in large and elaborate windows. In Italy they are as a rule fewer and far less grandly dimensioned. The brightness of the sunny south taught its

builders to exclude light and glare, and the use of stained glass was not encouraged. It is questionable whether such use would have been consistent with the methods of internal decoration common in Italy. Great spaces of wall, covered with fresco painting, might not unreasonably be thought inimical to the adoption of stained glass, through which a bright light would cast hues of undisguised variety on the carefully-studied harmonies of the painter. In the upper church of San Francesco at Assisi vitreous and mural decoration are both lavishly employed. Yet, although the writer has had the opportunity of visiting that fairy church of glowing and translucent colour under every condition of light, the one seemed to have no ill effect upon the other.

In England, and still more in France, the introduction of stained glass affected the design of churches to an enormous extent. If the northerners had not the mural polychromy of the Italians, their architects were no less fond of colour, and they found in large traceried windows generally, and often exaggerated clerestories in particular, a field for the application of colour on a large scale. That with which the Italians covered their walls their northern contemporaries placed in their windows.

In early Italian work the tracery is treated simply as a piercing in a slab of stone, and even in much later work—as in the cathedral at Siena, the Or San Michele at Florence, and the chapels of Sta Maria della Spina and Sta Maria della Rosa at Lucca—the traceries are still merely pierced slabs of stone, and not constructed traceries. The windows in the clerestory of Siena Cathedral are, however, noticeable as being, together with the aisle windows of the Duomo at Florence and Lucca, singularly beautiful in character, though their traceries play a very insignificant part. The windows in the nave aisles of the cathedral at Lucca—the best and simplest of the class—are wide, chamfered lancets, on each side of which a detached shaft, standing in advance of the wall and supported by a corbel, carries a pinnacle, the finial of which is a figure of a saint; a course of dark marble round the edge of the arch takes the place of a label in defining its outline, and a crocketed pediment of steep pitch, over the arch, and dying against the pinnacles, completes this very simple yet effective design.

On the south side of the nave of the cathedral at Arezzo there is some fine late thirteenth-century tracery in the windows, all of which are filled with superb stained glass of an Early Renaissance character. Here one very large two-light window has a bold central shaft and arches to the lights, and a circle in the head; but the soffit of this is square in section, and into it is inserted a wheel of tracery, also very square in section, and appearing as if it had been cut out of a plate of stone and inserted after the window was built. The whole resembles some windows on the south side of the nave of Paderborn Cathedral, in Westphalian Prussia. In all these traceries at Arezzo it may be observed that the piercings are invariably sharp and truly geometrical, and that the ogee line is never used, except in the head of a trefoil, and both these are facts for which these old Italian architects cannot be too highly praised.

The constant use of shafts with capitals in place of moulded monials, and the very frequent insertion of a bar of tracery across the middle of the height of the window, are two other peculiarities of the Italian mode of fenestration. The former feature does not seem to be so well suited to ecclesiastical as to domestic work, as it generally accompanied the system alluded to elsewhere in these articles—of fixing the glazing, whether plain or coloured, in wooden frames behind the stone-work, and hence seldom looked well in church windows.

The windows in the Duomo at Florence are examples of this peculiar treatment. Viewed externally they consist of two narrow lights with a little tracery in the head of the containing arch, but from within they appear in the form of one large lancet. Many visitors to this famed Duomo are puzzled how the glass is arranged in these windows, which have a detached column instead of a mullion, but the curious in such matters will find that the glazing is at least one foot behind the column, and that it continues equally behind the tracery; that is, the stained glass is comprised in one large broad lancet, and about one foot in front of it is a column supporting unglazed tracery. The glass is fixed by means of lockets and stanchion-bars, exactly like those in England and France. The lockets-bars are about 2 ft. 2 in. apart, and the lockets project, and are fastened on the outside. Between every locket-bar are three stanchion-bars, also on the outside, and the lockets themselves are about 7 in. apart.

The stained glass in these windows is beyond question the most magnificent in Italy, where this branch of ecclesiology, for reasons already stated, was never pursued with the same ardour as in northern countries.

In the Florence Duomo the windows show simple lancets with generally two figures side by side and a third surmounting them. The borders are deep, and the shadows thrown by the outside traceries are rather advantageous than otherwise, for they darken the upper portions of the glass. The openings being very large, the colours are more marked than in northern work, but then each colour is subdivided into a great many different tints, so that a jewel-like effect combined with great distinctness is produced. These Florentine windows appear to have been made from slices of large gems cut out and formed into histories and figures, just as they make the Florentine mosaic of the present day. When the writer visited the Opera of the Duomo he was shown some pieces of this glass; it was blue, of a greenish-grey tone, and very like what the late Sir Edward Burne-Jones employed, the effect of which is to bring up the other colours and render them more brilliant, whereas when a bright blue is employed for the background a contrary effect is produced.

The majority of the windows in the Duomo of Florence are said to be the work of Francesco di Domenico da Gambasso, a Florentine who had settled in Lubeck, but who was invited to his native city during the early part of the fifteenth century, for this purpose.

Donatello and Ghiberti are said to have had a hand in some of the later windows, but there can be no doubt that as many different artists were employed upon them as there were architects to the building. Indeed, in many cases the professions were identical, and the same man could equally design a building, paint the walls in fresco, fill the windows with glass, and make the stone and marble express his thoughts by means of sculpture. Giotto was one of these, and the practice was continued long after, as in the case of Vasari.

The last two bays of the nave of Florence Cathedral have sham windows. These are painted in distemper upon canvas stretched on a frame, and the glittering effect is produced simply by glueing on pieces of coloured tinsel for the high lights. The black lines representing the lead lines are very thick, and there is no tinsel used on the faces or hands, but where the tinsel is employed it is always in small pieces, placed an eighth or a quarter of an inch apart. So well are these windows executed that most visitors to the Duomo take them for real glass in the first instance.

Besides that in the Duomo there is much magnificent mediæval stained glass in Sta Croce and Sta Maria Novella, in Or San Michele, and in the circular window of San Spirito.

At Lucca the ancient glass in the apse of the cathedral, and in the church of San Giovanni, is very beautiful; so is that in the circular window at either end of Siena Cathedral. The two-light Middle-Pointed window that has been inserted in the Romanesque apse of San Paolo a Ripa at Pisa contains half figures of saints of great richness and brilliancy of tincture, and in the aisle windows of the Duomo there is much stained glass, brilliant in colour but confused in design. That in the east window of Prato Cathedral is somewhat coarse and crude. The large windows in the apse, clerestory, and south aisle of Arezzo Cathedral, but especially one at the east end of the south choir aisle, are of extraordinary richness and splendour; while in the same city a circular window in San Francesco, and several in the Annunziata, will repay careful study. Then there is the vast six-light Gothic window at the east end of San Domenico at Perugia, and, lastly, the entire series of windows in the Upper and Lower Churches of San Francesco at Assisi, principally of the fourteenth century, and of a very superior character.

If we glance at the ground plans of Italian Gothic churches we shall find nothing to delight us like we do in those of Canterbury and Lincoln, both churches of growth, or in those of Chartres and Rheims, both designed and carried out as we see them now, *d'un seul jet*.

The columns in Italian Gothic churches are widely spaced, so as to diminish the number of vaulting-bays, and to make the proportions of the oblong aisle vaulting very ungainly.

Still, there are beauties which must not be overlooked. The sculpture of the capitals, the beautiful, if not very varied, cloisters, the portals and smaller doorways, the canopied monuments frequently outside the churches, the skill in the manipulation of coloured materials, the grace of the campanili which vary considerably in the several districts—the Lucchese, the Genoese, the Florentine, the Roman, and the

Umbrian—cannot fail to elicit our admiration, and to store the mind with a vast fund of material.

Allusion has been made to the exquisite skill with which the Italian Gothic architects handled those precious materials of which their country offers so abundant a supply. That they were before all others devoted to the display of colour in their works admits of no dispute, and throughout the peninsula the bountiful plenty of Nature in the provision of materials was only seconded by the zeal of the artist. Just as there were in parts of Germany, France, Spain, and England large districts where no stone could be had without the greatest labour and trouble, so brick had to be used, as in Venetia and Lombardy; and here the reality and readiness which always marked the mediæval workman led to his at once availing himself of this natural material, and making a feature of his brickwork.

To sum up, it must be said that the Gothic of Italy has no such grand works to show as more northern countries have. The buildings were seldom beautiful as complete works of architecture.

Allowance has to be made at every turn for some incompleteness or awkwardness of plan, design, or construction. There is no attempt to emulate the best French plans. Milan Cathedral, magnificent as its scale and material make it, is clumsy and awkward both in plan and section, though its vast size makes its grandeur, internally, well-nigh unsurpassed for religiousness and solemnity. San Francesco at Assisi is only a moderately-sized Early German Gothic church of mediocre design converted into splendour by its coloured decorations. At Orvieto, a magnificent west front is put without any abutments against a church whose only merit is mainly that it is large and in parts beautifully outlined—the eastern front, though far less sumptuous than the western, is a nobler and more truthful piece of work—but wants poetry of design. The later Tuscan buildings are far finer, notably the cathedral of Lucca, whose interior is unsurpassed by any of its age in Italy for elegance of proportion, sobriety of detail, and, it may be added, picturesqueness. The other buildings, such, for instance, as the vast aisleless churches built by the religious orders, and which confront us in almost every large town of Central Italy, are poor and meagre in various parts of detail and design, and are only redeemed from failure by the picturesque monuments built against their walls, by the work of the painter, and by their furniture. In fine, Gothic art, as we look at it, was never properly understood in Italy, and, consequently, never reached perfection. *(To be continued.)*

VENTILATION AND WARMING OF CHURCHES.*

THERE are many churches which, from a hygienic point of view, are so unsatisfactory as to impair very seriously their efficiency as places for public worship.

The chief reasons which tend to make churches unhealthy are:

1. Large open timbered roof spaces, in which the air is chilled and down-draughts produced; inner vaulting in stone or wood below the outer covering, or a ceiling half-way up the slope of the roof reduces the chilling process considerably. As there are often no effective outlets for foul air in these roof spaces, it is impure air that descends to the breathing line to chill and poison.
2. Clerestory windows or lofty ground-floor windows also chill the air near them, which, thus becoming heavier, descends upon the heads and shoulders of the congregation below. The down-draughts from this cause, and from roofs, are often moderated by frequent use of the building and continuous warming. In too many churches service is conducted on Sundays only, and fires are not lighted until a few hours beforehand.
3. No provision made for fresh, warmed air to enter near, or below, the breathing line—e.g., at back of radiators.
4. No openings to allow of cross-ventilation just above the breathing line as in windows of all modern, well-equipped schools, but rarely found in churches. The absence of these openings causes the air to be stagnant, disagreeable, impure, and dangerous to health.
5. Damp floors and walls, which are apt to cause chills and colds in persons sitting near them. These are chiefly to be found in ancient buildings.

* Abstract of Paper presented to the York Congress of the Royal Sanitary Institute by J. Osborne Smith, F.R.I.B.A. (Fellow).

6. Hot-water pipes in channels sunk in the floor and covered by gratings. These channels, being usually in gangways, are receptacles for dust and dirt from boots, clothes, and the sweepings of the floor generally; when the floor is washed, dampness is added to the heated dust in the channel and upon the pipes. Thus conditions antagonistic to health are set up, to say nothing of the added danger when consumptives occupy seats near the channels.

7. Pits below the floor containing many gas jets for warming purposes.

8. Hot-air ducts, which are never, or hardly ever, cleaned out. It is not at all unusual to find ducts intended to convey fresh warmed air, neglected and dirty.

9. Boarded floors with open joints. It is not always borne in mind that there may be a mile or two of joints filled with dust in a church where boarded floors are used. Sometimes near each row of seats there are two or more holes in the flooring, about one inch in diameter, for ventilating the space under, which in course of time becomes a large dustbin only four or five feet below the breathing line.

These insanitary and unhealthy conditions prevail to-day, more or less, in most modern churches and other places of worship. Some of the older churches have worse health conditions even than those just described.

The requirements necessary to make the interior of churches healthy for use and occupation may be briefly stated thus:—

1. Ample means of cross-ventilation from openings in opposite sides of the building below or near the breathing line, in order to get rid of foul air at the very spot where it is generated. Cross-ventilation is also desirable high up near the flat ceilings, or in the sloping roof spaces, the openings being arranged to check or divert downward currents.
2. The inlets for fresh air to be as short as possible, capable of being readily cleaned, well distributed, and allowing at least one foot super of clear opening to about ten people.
3. Adequate means for warming incoming air, so that it may be not only warm but also pure and fresh as possible at the breathing line during services. Warming and drying air is a source of comfort, especially in a damp climate, but the drying can be so easily overdone as to be inconvenient. High temperatures should be avoided, and provision should be made for supplying additional vapour to the internal air when required.
4. Warmth just below open roofs, clerestories and tall windows to prevent down-draughts.
5. Jointless solid floors, which can be readily kept clean.
6. Seats and fittings which do not obstruct the passage of light and air, or hinder the cleaning of floors.
7. Means for preventing the deposit and movement of dust.

In cold weather, warmth, genial, all-pervading warmth is desirable inside churches during occupation; the cold, bracing, breezy air which is so enjoyable when one is moving about is not welcome inside where persons are sitting. Provision, therefore, must be made for:

1. Warming incoming air during the services as well as the inside air before occupation.
2. Preventing the inrush of cold wind currents from windows by fixing hopper lights to direct currents upwards, and from entrances by double doors opening outwards and closed by checksprings, and by placing radiators or stoves near the entrances.
3. Preventing down-draughts by fixing hot-water pipes in roof spaces and below clerestory and other windows.
4. Generous warming apparatus, well distributed, without excessive temperatures either in pipes or warm air flues. As methods of warming we have:
 1. Large close stoves near inlets for fresh air, which are very useful.
 2. Underground stoves, the heat ascending through grating at floor level, are effective, but the air is often too dry and polluted by dust.
 3. Warm air apparatus, by which cold air is admitted either from the church or from outside to a furnace room or battery of large pipes, and discharged into the church through vertical or horizontal gratings. This is usually an efficient arrangement, but the warmed air is liable to be contaminated by passing through flues and over pipes which are cleaned only at rare intervals.
 4. Low-pressure hot-water apparatus with radiators having fresh air inlets. This is effective and generally satisfactory when inlets are accessible for cleaning, and radiators are in suitable positions.

5. Low-pressure hot-water apparatus with pipes in channel. For reasons previously stated this is an insanitary method. It is also ineffective, as the heat given off is generally reduced by the non-conducting matter accumulating on the pipes.

6. Medium-pressure apparatus with small bore pipes next outer walls or in channels, in coils, or round skirting of raised wood floor on which are the seats. A useful and economical method for distributing warmth when pipes are kept above the floors.

By all these methods fresh air can be admitted to be warmed before entering the building, but in many cases this has not been done.

Hot-water radiators to which fresh air can be admitted by short, smooth, cleanable ducts above the floor, are cleanly and cheap; effective boilers are also quite reasonable in price. There is now, therefore, no good reason for placing pipes in underground cellars or channels, or for allowing the bracing air to be contaminated by passing through long dusty flues. Hot-water pipes or radiators can readily be fixed above the floor and under upper windows and roofs.

When designing new churches, provision for ventilating and warming need not add seriously to the cost, and its importance is such that it should not on any account be included in those interesting items left to be done later when money is available.

Much may be done to make church interiors healthy by giving attention to a few negatives:—

Don't have air brought in at floor level from beneath gratings.

Don't put hot-water pipes in channels under gratings in the floors.

Don't cover doorways with curtains.

Don't close all windows or ventilators at the same time; if a south-west gale prevails, those on the north side might be open without discomfort, and vice versa.

Don't try to save fuel by closing all the inlets and outlets for air when the church is occupied; it is false economy. They may be closed when the building is empty.

Don't fail to warm sufficiently a large proportion of the incoming air in cold weather.

Don't suffer down-draughts to exist; they are most dangerous to health, and can be prevented by judicious warming.

Don't fail to warm the triangular spaces in roofs which are open up to the ridge.

Don't have many supports beneath the seats, so that floors can be kept readily clean.

Don't fail to concentrate warming near entrances.

Don't encourage the use of blinds, curtains, matting, wicker seats, or anything which harbours dust.

YORK FIFTY YEARS HENCE.*

Few towns present such an instructive history of town planning as York.

There was certainly an earlier settlement before the times of the Romans, and this is supported by the name Eboracum, which contains the syllables Yorac, the same as Ure, the old name of the river on which the city is situated, and which is still applied to its higher reaches. The very situation of York was determined by the ridges of glacial drift which here cross the valley from Tadcaster to Stamford Bridge. Primeval man in all countries had sufficient intelligence to choose the driest path along the top of the ridges, and the primitive track was followed by the Roman road, of which traces are preserved in the name of Street Houses, where parts of it still remain open as a bridle-path through the fields, though superseded for carriage traffic by the modern road, which follows a less direct line. Such diversions, when the land is unenclosed, are very common, and are often determined by such trivial causes as the old road falling out of repair or being blocked by encroachments. Nearer York I have seen a well-preserved piece of the road crossing Queen Street outside the walls, and it continued straight down Toft Green to a ford at the Guildhall, and so up Common Hall Lane to the main gate of the Roman city. Roman piles are preserved at the Guildhall, which were taken out of the bed of the river at this ford, and the foundations of the gateway exist in the cellars of the insurance office in St. Helen's Square. I could give similar details of several other primeval and Roman roads, but this must suffice for our present purpose.

The Roman castrum, or camp, was evidently most carefully planned. It was rectangular in form, and parts of the foundations of its walls can still be traced from the south-west gate above-mentioned in St. Helen's Square to the Multangular Tower in the Museum Gardens, which was the west corner of the Roman city. From this corner it can be traced to Bootham Bar, the north-west gate, from which led the main road to the north, and much of it is concealed under the present mediæval wall behind the Deanery gardens to the north-east gate in Mr. Gray's stable yard, the road from which led to Derventio (Malton) and the Cawthorne Camps.

Passing Monk Bar, it still followed the line of the mediæval wall till it turned to the south-west across a street which still bears the Saxon name Aldwark (old fortifications) to the south-east gate in King's Square, whence led the road along the ridge to Stamford Bridge, and thence to Bridlington. I have seen Roman piles where this road crossed the foss in Walmgate.

The main street via Principatis still exists as Petergate from King's Square to Bootham Bar, and when the main drainage was being put down in my boyhood I remember seeing a piece of Roman drain exposed at the end of Grape Lane. It was about a foot deeper than the new brick drain, and far more solidly built of carefully hewn stone.

The main cross street started from St. Helen's Square, and parts of it still exist as Stonegate and Chapter House Street. The line of it passes through the choir of the Minster, which is the most recent part of that edifice, and the street was doubtless diverted at the time of its building.

There can thus be no doubt that the Roman city was built on a carefully-thought-out plan, and formed part of an organised system of roads and works constructed to suit the natural configuration of the country. A modern royal engineer could not have planned them better.

And now as to the more immediate present and future.

I have given much thought to the best plan for the development of the York suburbs. During my student's life in London I became familiar with the Bloomsbury squares, which are built on the rectangular plan; and on my first tour abroad in 1869 I was much struck with the construction of Karlsruhe, which is built with streets radiating like the spokes of a wheel, with others connecting them in a circular direction. Both areas had evidently been built brand new on a predetermined plan, but either plan in its entirety was obviously impracticable to be applied to an old straggling city like York.

At present there are a great number of roads radiating from York, some of which, no doubt, require improving or even supplementing, but the great necessity is for improved communications in a circular direction. A vehicle at Acomb, for instance, requiring to go to Dringhouses must come round by York, a distance of two or three miles, though less than half a mile of new road would enable a direct course to be taken at a considerable saving of distance, and almost the same applies to the want of a new road from Heworth and the Malton Road, say, near Elmfield to the North Road at Clifton, connecting with the roads to Huntington, Haxby, Wigginton and Rawliff on the way.

Any new scheme of town planning for York must therefore include, at any rate, one circular road at the outskirts of the area at present built upon, and keep in view the probabilities of another, further out, in view of further developments.

The inner ring might start from Clifton Scope, where a bridge would require to be built, and traverse the vacant land between the Leeman Road houses and the river, to near the waterworks, where it would cross the railway by the existing bridge. The lane from the bridge to the Poppleton Road would require widening and grading. Crossing the Poppleton Road it would go almost due south to the Acomb Road, which it would cross near the present tramway terminus, thereby developing the rising ground west of the waterworks reservoir and the existing road into first-rate villa sites. After crossing the Acomb Road it would follow the line already approved by the Corporation through the Holgate Gardens estate and some fields to Hob Moor, which it would cross to the Dringhouses Road before coming to Mount Villas. The exact point of crossing the railway, and whether over or under, would require consideration. It would then cross Knavesmire, keeping to the north or city side of the round racecourse, till it joined the existing avenue, which it would follow to just beyond the grand-stand. From this point there is a line clear of all buildings beyond the South Bank Estate to the river and across it to the Fulford Road, near the north end of St. Oswald's Terrace. This part of the road should be secured, even if the building of the bridge had to wait some years. Crossing Fulford Road, it would cross fields and Lowmoor nearly to Heslington, developing

* Abstract of Paper read before the York Congress of the Royal Sanitary Institute by Mr. Tempest Anderson, D.Sc.

the tract of land between it and the existing lane, with which it runs parallel. Before quite reaching Heslington it would turn through fields and possibly part of Lowmoor to the ridge beyond Garrow Hill, and join the Hull Road before coming to the Bees Wing Inn. It would cross this road and go right across the low land to the middle of East Parade, Heworth, following almost the line of Bull Lane for the latter portion of the way. This portion would develop some of the best building sites still remaining about York. The low land by the beck should be acquired for a recreation ground, as it is too low to be built on. Some expense would here be incurred in a bridge over the railway, which might have been obviated if the plan had been in existence a few years ago.

Crossing from East Parade at the end of Bull Lane to Heworth Moor along the existing lane would require the purchase of two cottages and a house. After crossing Heworth Moor the road would continue straight across the plateau nearly to the foss, near Yearsley Bridge, where it would join a straight road from the corner of the Malton Road, near Elmfield College, across the foss, in front of Rowntree's new dining hall, to the Wigginton Road at the railway bridge over the Foss Islands Branch. It would cross the Scarborough line by a new bridge north of the existing Burton Lane crossing, which would be diverted to the new road. The road would then continue straight to the North Road, near Clifton Asylum. After it passed the corner of the existing Burton Lane cottages, the ring would leave the above straight road, and a short piece would bring it into Water Lane, and so on to Clifton Green and Clifton Scope, thus completing the circle. The portion of this road beyond Clifton and Burton Lane ought to open out the district around Bootham Stray, which, if properly planned round the stray as a park, ought to make a most attractive residential suburb, and accommodate a number of good customers for our tradesmen.

Mr. T. W. Spurr, city engineer, York, said in regard to town planning in York, some progress was being made in a serious attempt to develop the outskirts of the city on town planning lines. As they would realise, the process and formula to be gone through to satisfy the Local Government Board was not all that could be desired so far as speed was concerned. But at the same time, a very large area in the outskirts of the city was being dealt with and was now almost complete, and would soon be ready for a meeting of the owners early in September. With regard to the new street, it would not stop immediately over the Foss Bridge. The whole of the property was being acquired so that it would link up with Piccadilly, and at the last meeting of the City Council the street was named Merchantgate. It was a fact that the greatest inconvenience they had here was to get across from one suburb to another, and any scheme taken up in York must include this important necessity. What York was short of was a direct communication between the Fulford Road and the Dringhouses Road, but until they could undertake the planning of the city actually it was very difficult to say what would be the best thing to be done.

Miss G. A. Lowe (Warrington) asked, with reference to the erection of poor houses at Hepworth, if they were not going to build them there, where were the people who inhabited those houses to be put? Was it not wiser to arrange some scheme whereby the artisan class could have a sort of a model village? She knew it was the general view for most towns to cater for the better classes, but it seemed to her such a pity that they did not at the same time cater for the lower classes.

Dr. Tempest Anderson, replying, said that question had not been overlooked in York. Mr. Rowntree, of Rowntree's Trust, of which he himself was a trustee, had spent £20,000 in providing for that in arranging the model village. The Holgate Land Company bought a large piece of ground, which they laid out, as they thought, on reasonable lines, for the very purpose of providing small commodious houses and broad streets, with good access to them. The first difficulty was the question of sewage that absorbed a large portion of their capital. Then they were told that they were building those streets a good deal too wide, and a Councillor of the Corporation who was on the committee said: "Who is going to pay for those trees and grass margins? Do you propose to endow them, because it will require another man to do this?" They said they thought that if they could buy the land and make roads that might be sufficient. So that instead of encouragement from certain people they got nothing; they were considered visionaries, and the result was they had to borrow money from the Insurance Company. The dwelling sites did not go off as well as was anticipated, because a thousand workers were taken from the railway works and sent to Darlington about that time. The interest on their loans

increased so much that the Insurance Company foreclosed their mortgage, and the whole concern was therefore taken over by them. But the final thing was that he was left with one or two small lots, and sure enough he had a notice from Mr. Lloyd George intimating an extra tax for undeveloped land. Their experience, therefore, in providing better accommodation without cost to the ratepayers had certainly not been a success. This subject of the planning of York was so important that he would be glad if the Corporation offered a prize or a series of prizes for the best plan which should include that ring he had spoken of, and the other matter. He would be happy to contribute £100 towards such a desirable end.

The Chairman remarked that there had been an enormous provision for the artisan class in all directions outside the city of York.

Dr. Armstrong (Newcastle-on-Tyne) said he thought slum property should be dealt with on the lines adopted by the Liverpool Corporation, which was to provide for the very worst of slum dwellers.

Mr. Brodie (Blackpool) said that in his town they had dealt with the street question in a different way. He saw the owners of the land, and said that if the owners bore the cost of the street up to the width required by the by-laws then the Corporation would pay the cost of making it the extra width. They recently widened a street and put in sewers, and by the sale of the surplus land were able to recoup themselves for the whole cost.

INTERCEPTING TRAPS.

Do we really know anything at all about sanitation? If there has been one axiom which has been regarded above all others as the primary foundation principle of drainage, it has been that the drains must be disconnected from the sewer by an intercepting trap, but now we are told in the report of the Departmental Committee appointed by the President of the Local Government Board to inquire and report with regard to the use of intercepting traps in house drains, that the intercepting trap on the whole is not necessary, save in exceptional cases to prevent nuisance from the smell of sewers.

It will be within the knowledge of many of our readers that efforts have been made by various Local Authorities to introduce a system of ventilating the sewers through the house drains connected to them. The Departmental Committee whose report has just been issued was appointed to carry out an investigation which originated with a proposal by the Willesden Urban District Council to adopt a series of building by-laws in which the requirements as to the provision of an intercepting trap were to be omitted.

The case for the use of the intercepting trap has rested upon the presumption that the trap would prevent an entry of sewer gas into the house drain and that it was desirable to prevent this entry. The Committee's report apparently establishes that sewage air is not on the whole detrimental to health, and therefore on this account the intercepting trap is not necessary, neither can it be established that the intercepting trap is necessary to prevent the pressure of sewer air forcing the traps on even an unventilated house drain, still less if the house drain is furnished with a proper ventilating shaft.

On the other hand the intercepting trap has disadvantages which are substantial and of serious practical importance, and as the most important of the effects of these disadvantages are hidden from view, they may remain in existence quite unknown to the householder.

One disadvantage of an intercepting trap is the usually assumed necessity for a fresh air inlet which is prone to become a foul air outlet. The Committee state that the only ventilation which appears to be required on a house drain apart from the anti-siphonage pipes is that which should be provided by the opening at the top of each soil pipe.

Another disadvantage of the intercepting trap is its tendency to retain a considerable proportion of the solid matter of the sewage passing through it at any given time, and thus to favour blocking of the trap as well as putrefaction of the sewage before it reaches the sewer, but this tendency, says the report, may be diminished to a great extent by using a trap of smaller diameter than is customary at present. The strongest indictment against an intercepting trap which is made by the Committee's report is that the liability of the trap to become blocked appears to be insuperable and it is this liability which

constitutes its most serious disadvantage. The accumulation of sewage in the drain produces a block from which many undesirable consequences may follow not readily evident with ordinary drains and, therefore, which may long remain undiscovered.

This block of the trap and accumulation of sewage appears to be very common, evidence of it having been found in more than 23 per cent. of 5,600 traps which were specially examined.

The conclusion therefore is that while the intercepting trap has serious disadvantages the work which it is supposed to do is not necessary to be done. On the other hand the importance of the effect which the presence of the intercepting trap has on the ventilation of sewers, on which much stress has been laid, has probably been exaggerated. The free ventilation of sewers appears to be unnecessary either for the prevention of pressure of sewer air on traps or the safety of sewer men, except in the cases of sewers which are large enough to admit them. Even in such sewers, however, it is dangerous to rely on ventilation alone, and special precautions should always be taken. Moreover it is exceedingly difficult to ensure that sewers are freely ventilated, even when the most elaborate measures for this purpose are adopted.

This difficulty of the ventilation of sewers accounts for the liability of unpleasant smells being carried by sewer air, and this seems to be the only reason in the Committee's opinion for the occasional and exceptional use of intercepting traps. The Committee's report also disposes of the assumed value of the intercepting trap as a barrier against the passage of rats from the sewer into the house drain. It was shown by the evidence that rats had been known to pass through an intercepting trap from drain to sewer and conversely from sewer to drain.

Although the Committee are satisfied on both general and epidemiological evidence that sewer air is not detrimental to health they do not extend the same qualification to drain air, but in this respect we are unable to agree with the conclusion that appears to have been drawn by the Committee from the evidence contained in the report. The Committee say that the bacteriological evidence suggests that if exposure to drain air is related, as many suppose it is, to attacks of sore throats or other septic affections, the explanation may be found in the liability of drain air, unlike sewer air, to carry in suspension large numbers of microbes of sewage origin.

We do not agree that the liability of drain air of which the Committee here speak is proved by the evidence from which they have apparently drawn their conclusion.

It is true that bacteria were found in drains, but these bacteria only occurred when splashing took place in the sewage.

A quotation from the report will we think enable our readers to follow our objection to the conclusion drawn by the Committee from the evidence before them. The report says:

"It is also established by Dr. Andrewes' experiments that the presence of sewage bacteria in drain air, as the result of splashing, lasts only a very short time, and that they subside with great rapidity. The appearance of sewage bacteria after splashing is doubtless effected, not by the ejection or active disengagement from the sewage of the bacteria themselves, but by the detachment from the splashing or disturbed sewage of more or less minute drops of sewage. If the passage of sewage or water through an intercepting trap be watched, as, for instance, in an open experimental installation like that used in the Islington experiments, it will be observed that droplets are frequently thrown off from the liquid, sometimes to an astonishing distance. Besides these comparatively large visible droplets there must be many so minute as to be invisible, and it is from such minute droplets that Dr. Andrewes concluded that the plates used in his drain air experiments were mainly infected. It is possible that the enclosure of microbes in droplets helps to explain their extremely rapid subsidence, which was such a striking feature of his experiments."

We think that this quotation disposes of the view that sewage bacteria are frequently present in drain air although such bacteria are usually absent from sewage air. There can be no doubt in our opinion that the test plates exposed by the experimenters received infection from liquid and not from air.

In the experiments by Dr. Andrewes the time of exposure of some of his plates was only $2\frac{1}{2}$ minutes. On the first plate exposed during the flushing of a closet thirty-eight colonies of microbes were found. On the following three plates, one colony, two colonies and one colony respectively were found, and we agree with the Committee that these experiments bring out very clearly that splashing is the cause of the presence in large numbers of sewage microbes in drain air, and that the effect of this splashing is instantaneous and extremely evanescent in its duration.

We cannot see how any other conclusion can be drawn than that sewage microbes are only present in drain air as long as minute droplets remain suspended in that air, nor can we see that there is ever likely to be in the ventilation of house drains a current of air of sufficient velocity to carry even the minutest droplets into a house.

To reduce the danger from splashing the Committee suggest that in inspection chambers the usual open channels should be closed with a removeable cover. They also strongly recommend the use of iron pipes for drains, both as a means of reducing the liability of intercepting traps to blockage and as a safeguard against the tendency, now becoming well recognised, of stoneware pipes with their numerous brittle joints to become leaky within a very short time of their being properly constructed and found to be sound under the water test.

NOTES AND COMMENTS.

THE British Standard Specification for structural steel for bridges, &c., and general building construction has been revised by the Engineering Standards Committee, the revision dating from last month. It is of importance to architects who have to deal with building in London from the fact that the London County Council General Powers Act (1909) requires that all rolled steel used in the construction of skeleton framework for building shall comply with the requirements of this specification. The original Standard Specification for steel was issued in 1906, and naturally various points have arisen in connection with its use and have been brought before the notice of the Engineering Standards Committee. Hence the revision. Amongst the more important items of this is the classification of the material into two categories—A Steel and B Steel. A Steel must be made by the open hearth process, and must not show on analysis more than 0.06 per cent. of sulphur or phosphorus; B Steel may be made either by the open hearth process or by the Bessemer process and may contain as much as 0.08 per

cent. of phosphorus, and 0.06 per cent. of sulphur. B Steel is not intended for bridges nor for plates $\frac{1}{4}$ in. in thickness and over, and rivet bars. That is, it may be used for building but not for higher grade engineering structures.

The upper limit of tensile strength for plates, sections and bars, other than rivet bars, is raised by one ton, so that the steel now stands as between the limits of 28 and 33 tons per square inch of section. This means of course that higher carbon steel can be used for building. The lower limit of tensile strength for rivet bars is reduced by one ton, and now stands as between the limits of 25 and 30 tons per square inch of section.

The preface of the revised edition states that amongst the more important modifications of the Specification is the insertion of a clause dealing with tests by an independent expert, but we do not think that the independence or the expertness of the person called in the Specification the "Inspector" is fully guaranteed. In the revised edition it is provided that tensile test pieces may be specially selected by the Purchaser, or by the Engineer or by the Inspector, and the footnote explains that the Inspector shall include any person acting under the direction of such Engineer or Architect. It seems to us that whilst the Inspector might be an independent expert he need not necessarily be so. Other important clauses provide for the possibility of rejection after delivery and arbitration in case of dispute. Although these are the most important provisions the Specification generally has been re-cast and amplified.

The Engineering Standards Committee have now issued British Standard Specifications for cast-iron sprocket and socket Soil Pipes, and cast-iron sprocket and socket Waste and Ventilating Pipes for other than soil purposes. These specify the quality of the material and workmanship, the weights and forms of bends and access doors, and of branches and other fittings. It is also specified that every pipe shall be tested for soundness, by being struck all over with a light hand hammer, and that all the parts of the interior of pipes and fittings shall be galvanised or be coated with Dr. Angus Smith's or other approved composition as may be specified. We should have been glad if the Committee could have specified a really dependable and durable preservative coating or process for the interior surfaces of cast-iron pipes. Numerous diagrams are given with full detailed particulars of sizes of parts, radius of angles, &c., so that it will now be easy for engineers, architects and everyone concerned to ensure uniformity by adherence to the British Standard. In one particular the Committee have departed from the regulations of the London County Council drainage by-laws for pipes of 5 and 6 in. internal diameter, by reducing the caulking space from $\frac{3}{8}$ in. to $\frac{1}{8}$ in., which they consider preferable.

The most interesting articles in the *Connoisseur* for this month are, to our mind, one on the Taylor Collection, in which many phases of artistic craft are illustrated, and a further instalment of the series on "The City of Liverpool and its Plate." Of less general interest are articles on Plumbagos, Japanese Pottery, Ancient and Modern Embroidered Pictures, and some Relics of the Spanish Armada.

In the *Antiquary* the series of articles on "The Ornament called Honeysuckle" is concluded, with illustrations from examples in the British Museum. The inexhaustible topic of "Some Curious Carvings found in some old Churches" is the subject of a further chapter by George Bailey, illustrated with sketches from carved misereres.

It may now we fancy be taken for granted that the battle over the podium of St. George's Hall has been brought to an end, the City Council of Liverpool having decided to enter into a contract for carrying out the altera-

BRADGATE CASTLE.—THE CHAPEL.

tions proposed by Sir Goscombe John, R.A., Mr. Norman Shaw, R.A., and Mr. John Belcher, R.A. Those who opposed the alteration of the podium have apparently made their last effort in endeavouring to prevent the acceptance of the tender for carrying out the work proposed by the three eminent Royal Academicians.

The Circular of the Local Government Board to Rural District Councils, to which we referred in our leader last week, has not been so long in meeting with a desirable response. The Farnham Rural District Council at their meeting last week have not only decided to amend their by-laws and approved plans permitting of the erection of cheaper cottages, but they propose themselves to erect model cottages in their district in order to show the economy which builders would be enabled to effect by reason of the amended by-laws.

The Garden Cities and Town Planning Association desire us to call attention to the fact that they are prepared to send lecturers to any part of the country to deal with the great and increasingly important question of Garden Cities and Town Planning. Lecturers competent to deal with all aspects of the cause have been secured and dates may be booked up.

The report of the Chief Sanitary Inspector of Glasgow on the operations of the Sanitary Department for the year ended December 31, 1911, is not pleasant reading:—"Taking the standard of fifty people upon each acre as permitting of a really healthful existence—the standard adopted by several town-planning experts—we find," he says, "that only in nine wards out of the twenty-six does this condition obtain. These wards are, in the order of precedence, as follows:—Pollokshields, Exchange, Kelvinside, Springburn, Cowlands, Maryhill, Blythswood, Langside, and Dennistoun. In the other seventeen wards, beginning with Anderston, containing 62.58 per acre, up to Cowcaddens, with 214.5 on each acre, we have an overfull city—a city standing much in need of a well-thought-out and orderly process of expansion of the population over virgin soil. So long as we have such wards as Hutchesontown, with forty dwelling-houses upon each acre, and Cowcaddens, with forty-five upon an area which should only contain about as many persons, we must look forward to high death-rates and an abnormal amount of preventable disease."

BRICK-BUILT CASTLES OF LEICESTERSHIRE.

BRADGATE CASTLE, though in ruins and not of any great archaeological interest, owing to the decay of its monuments, is, nevertheless, an interesting specimen of brick building. The fact of it being the one time abode of Lady Jane Grey enhances the interest to such an extent, that many archaeologists and artists pay it a visit. It is unnecessary to give more than a brief account of its history, and a description of the constructional features, as there is a wealth of material at hand more interesting to the student of architecture.

Lady Jane Grey was bred and studied within the walls of Bradgate Castle, which fact proved it to be a residence of beauty, for Lady Jane Grey was a lover of nature and beautiful works.

Bradgate lies low, is seated in a valley, and stands upon the borders of Charnwood Forest. The building itself was a square with four turrets, one at each corner. The vaults or cellars are overgrown with nettles and alder, the garden walls are, in part, remaining; as is the terrace. The pleasure or courtyard with gardens are still traceable, although now they have somewhat the appearance of a wilderness. The chapel, which also stands near the ruins, is in the best condition, care having been taken of the roof and window, but till a few years back it was in a shameful disorder. The heads, legs, and arms of many important stone monuments of the Grey family formerly lay blended with the dung of horses and cows, but they are now shut up from the eye of the visitor in the old chapel.

Many of the brick castles of Leicestershire have been destroyed by fire. This fact would appear curious, as so little inflammable material is to be seen in their construction. Very little woodwork is visible: brick, stone, and lead being the principal materials. Bradgate Castle shared the fate of its companion at Kirby, about five miles distant, but, in this case, it was set alight by a woman. According to Throsby, it is said of the wife of the Earl of Suffolk, who last inhabited Bradgate Castle, that she set it on fire at the instigation of her sister, who then lived in London. The story is thus told: "Some time after the Earl had married he brought his lady to his seat at Bradgate. Her sister wrote to her, desiring to know how she liked her habitation, and the country she was in. The Countess of Suffolk wrote for answer: 'That the house was tolerable, that the country was a forest, and the inhabitants all brutes.' The sister in consequence by letter desired her to set fire to the castle, and run away by the light of it. The former part of the request, it is said, she immediately put into practice, and thus this celebrated and interesting place was consigned to the flames."

The floor of the castle was of plain brick, laid in rough mortar; nearly everything which could be constructed in

BRADGATE CASTLE.

brickwork was done so, with the exception of a few stone quoins and window heads. Arches were turned over openings in pressed bricks, with moulded faces, and iron gates were used instead of wood doors, wherever possible, even to the connection of the bedrooms, where presumably curtains were adopted.

It is interesting to note the number of ornamental iron ties, which were used for strengthening purposes there. The builders were not content with constructing a wall of solid brickwork five to six feet thick, but they must needs introduce iron ties and bolts, an inch in thickness to prevent settlement or swelling. The foundations were carried down to the rock, and the arch for transmitting weight to certain portions was much used.

There are windows and loopholes everywhere, so that the occupants could command a view of the surrounding district, and keep a good watch for marauders.

The bricks are longer and thinner in shape than the present standard size, and appear to have been hand-made; they are very coarse, with stones and flint showing. The mortar joints are in some cases quite an inch thick, and, as in the case of Kirby Castle (described in a previous article), the mortar is far stronger than the brickwork.

Nailing was never resorted to in this type of building; the builders preferred to bore holes through beams, and peg the joists to it. Plaster was utilised to cover the walls; two-coat work was employed, an inch in thickness for each coat; this was strengthened with reeds from the brook, but the builders were not particular whether small sticks or the stems of ferns were used to increase bulk and strength.

Bradgate Castle though crude was a triumph of brick building at that time, considering the many difficulties which beset the builders.

Ashby (styled de la Zouche, from its having formerly belonged to a family of that name) is situated in the hundred of West Goscotes. After the extinction of the male line of the Zouches in the reign of Henry IV., the manor came to Sir Hugh Burnell, knight of the garter, by marriage with Joice, the heiress of that family. From him it devolved to James Butler, Earl of Ormond and Wiltshire, who was attainted on account of his adherence to the party of Henry VI. In the first year of Edward IV. it was granted by that king to Sir William Hastings, who in consideration of his services was created a Baron, Chamberlain of the household, Captain of Calais, and Knight of the Garter, and received licence to make a park and crenellate, or fortify, several of his houses.

Ashby Castle was constructed of materials plundered from other castles. Lord Hastings procured the lead from off Belvoir Castle, which had been committed to his care. Stoke d'Albange was also despoiled of its more expensive materials and ornaments for building Ashby, by this robber lord.

The Council Board, it is said, seized Lord Hastings, and two hours after he was beheaded in the Tower by the order of Richard, III.

Throsby's book on Leicestershire informs us that in November, 1485, the attainder was removed from the Hastings family by Henry VII., after the battle of Bosworth Field, and all their estates were restored. Ashby Castle since then has regularly descended to the Earls of Huntingdon, many of whom are buried in the parochial church.

The castle, with its courtyards and grounds, is so extensive as to make a general description impossible.

The south courtyard, which is in the form of a rectangle bounded on every side by ruins, shows an extensive and beautiful view, the old chapel on the left, with a massive but well proportioned tower opposite, and a long range of buildings leading from it, linking the whole together, and forming a perfect courtyard.

The tower claims attention first; it is in excellent preservation, with monumental sculpture and ogee crocketed niches pierced in the wall facing the courtyard. These niches contain heraldic designs carved in stone of a very fine texture. Their height makes it quite impossible to procure any photographs, as they can only be seen through a pair of field glasses. It appears curious that such fine carving should be executed twenty feet up a wall, with no apparent means of access to it.

After passing under the semi-circular arch, through the tower, the visitor is confronted by a door, which leads up a tortuous flight of ninety-nine steps into a room about ten feet square, with an oriel window to light it. This was the room in which the unfortunate Lady Jane Grey was imprisoned for a time. The outlook from this somewhat bare prison is very beautiful, commanding a wide view of the north and south courtyards with their surrounding buildings.

There were other rooms in the tower, but the ceilings and roof have fallen away. Very little wood was used there, the first floor in most cases was supported by arched ribs and columns built into the walls. The decoration must have been very fine; the interior of the tower still exhibits remains of ornaments which are of eastern design. The walls were built of brick and stone, usually a brick core faced with limestone. The fireplace in the room next to Lady Jane Grey's prison is worthy of note; it is covered with carving, depicting war scenes, also trophies of the chase, intermixed with martial designs.

On descending to the ground a small flight of steps leading down to a square doorway below the floor level gives access to one of the dungeons, so much used in the fourteenth century. The hole—for it was nothing more—is five feet square, and about six feet high, containing a stone seat. When the low door was closed, which presumably was fitted with a barred wicket, the place must have been practically devoid of light or air. The guard rooms were so placed as to make escape from the dungeon impossible.

The rooms or halls for the men-at-arms were lofty and wide, with an underground passage leading to the assembly rooms.

The kitchen quarters of the castle are opposite to the tower just described. This is one of the most interesting

ASHBY CASTLE.—FROM THE SOUTH.

parts of the ruins. The kitchen is approached by descending a few steps and passing under a semi-circular arch, the idea being to keep the doorway out of sight, just in the same way as the present architect endeavours to plan his kitchens at the back of the house.

The photograph shows a very wide fireplace in this kitchen with a small apartment in the centre. This apartment, containing a stone seat, was designed for the scullion,

of the kitchen, with a pantry and a niche on the left. The niche was built for the purpose of supporting the tackle for lowering a bucket into a well below. The thirteenth century builders were always careful to have water close at hand and food also, as in those troublous times they were ever expecting to be surrounded and supplies cut off by their opponents. This well is thirty feet deep circular in shape. The opening on the right of the pantry was used as a private

ASHBY CASTLE.—VIEW SHOWING DOORWAY TO SECRET CHAMBER ON THE RIGHT.

usually a small boy, who sat and turned the spits for both flues, one each side of the seat. The heat must have been very great, and a small aperture was pierced between the two flues for some of it to escape. Spits in other buildings of this type were turned by dogs, which were leashed to it and forced by the scullion or cook to trot round in a circle, so turning the joint. Two large ovens are to be seen, one on each side of the flues; they are mere holes hollowed out of the stonework, and were used chiefly for baking bread. It is said that a whole ox has been roasted in this fireplace. This is quite probable, as the width of the opening is fourteen feet. The small photograph shows the opposite side

ASHBY CASTLE.—PANTRY AND DOORWAY IN WALL ABOVE

door to the kitchen, for the use of the mistress, who no doubt supervised the culinary work.

Over the niche the reader will notice an opening in the wall. This was used by the servants to carry the food through the wall, which is eight feet thick, into the banquetting chamber.

The castle boasted of several means of escape by underground passages and secret chambers. The entrance to one of the best, and in good preservation, is depicted in the photograph, on the left hand side of the great fireplace. This passage is constructed entirely of brickwork with an arched roof. The width is three feet by seven feet to the soffit of

ASHBY CASTLE.—THE KITCHEN AND ENTRANCE TO UNDERGROUND PASSAGE.

the arch. About fifty yards down is another branch of the passage to the left. This branch is now bricked up, but at one time it led to a farmhouse four hundred and seventy yards away from the castle walls, and was used as refuge and a store for provisions in case of siege. The main passage is roughly a hundred yards long, and ends abruptly in the south courtyard, with another flight of steps to the ground level.

Next to the kitchen after passing a buttery, well stocked with shelves and admirably lighted, is the banquetting hall, with a minstrels' gallery. This room was probably the most magnificent; the remains are still very fine. Many hooks are visible on the walls, which at one time supported tapestries. Panelling was fixed there to hide the stone and brickwork. In this hall dinner was served up by thirty-four knights in velvet gowns and gold chains, when King James I. visited Ashby in 1617. Everything was sumptuously magnificent which crippled the resources of the Earl. Lady Flora, daughter of the first Marquis of Hastings, concludes a poem on Ashby Castle, describing this visit of the king to her ancestor, Henry, fifth Earl of Huntingdon, as follows:—

"The bells did ring, the gracious King
Enjoyed his visit much;
And we've been poor ere since that hour,
At Ashby-de-la-Zouch."

The chapel is a plain structure, and not very large, its main entrance was approached from the north and south courtyards. The tracery has, of course, crumbled away from the windows, but there are indications of leaded and stained glass having been used.

The north courtyard appears to have been used as a strongly walled pleasure garden, long narrow arches and small quaint doorways; everything in fact was, and is, different from the stiff military Gothic architecture of the south courtyard. A few more small rooms and outhouses are dotted about, but they are not worth mentioning, as their ruinous state makes it impossible to find the nature of their use.

In the month of November, 1648, it was resolved that the garrison and castle of Ashby-de-la-Zouch should be "slighted and made untenable." Thus, says Nicholls, "was this noble structure soon after permitted to dissolve, with the downfall of the monarchy and the king's (Charles I.) interest, these unworthy ends being effected by the Parliamentary Committee then sitting at Leicester, which com-

mittee, having sent some of their members to view the place, employed divers persons to demolish these goodly towers by undermining, William Brinbrigg, commanding a party of horse for the occasion, bearing the oversight thereof." Since then, what was once a castle, massive and strong, is now a famous ruin.

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

IV.—FACADES.—DOORWAYS.—CAMPANILI.—DOMES.

(Continued from last week.)

THE first view of an Italian church, whether Romanesque or Pointed, is strikingly different from anything we are accustomed to in our own ancient buildings.

Generally speaking, it is a long, broad, rather low building, lighted with but few windows, with a small clerestory, if any, and with but little irregularity in shape or plan. We rarely meet with more than one tower, and this is seldom combined with the rest of the design in the manner common to us in England or France. There is no approach, then, to such combination of steeples as are familiar to us at Lincoln, Wells, Laon, Coutances, or Rouen, to the loss, it must be confessed, of much external grandeur. The steeple, when it does occur, is often detached, and when it is engaged it is placed in some irregular and abnormal position, where it is at once felt that it is purposely not intended to be looked at in conjunction with the main façade of the building. The only relief to the monotonous outline of the main building is at the crossing, where something in the way of a dome is occasionally introduced, as at Pisa and Siena, but this is always of but slight elevation, and not intended to produce any of the effects aimed at in the central towers of the north.

In the façades of Italian churches we have a portion on which, in common with ourselves and the French, the architect often lavished the greatest pains. The treatment is very similar in its idea throughout the whole period during which the style prevailed, and the effect produced is undoubtedly often very striking.

ASHBY CASTLE.—THE CHAPEL.

In none of the minor Italian cities can the architectural genius of the twelfth and thirteenth centuries south of the Alps be more advantageously studied than at Lucca, where almost every church presents the features characteristic of the same local type, borrowed from the Pisan, but more fantastic, redundant, and barocco.

The façades of San Michele, Sta Maria Forisportam, San Giusto, and San Pietro Somaldi may be accepted as typical of the kind prevalent in Tuscany during the epoch above alluded to, and which may be described as having a basement storey enriched with a series of shallow blind arcades with half columns or pilasters supporting round arches of narrow span, the central one being occupied by a square-headed doorway whose lintel, often highly enriched, is surmounted by an arch, though not often enclosing sculpture. Above this basement storey are two to four storeys of detached arcades with slender columns and round arches, the flat surfaces behind being inlaid with coloured marbles, and the capitals and spandrels adorned in strange profusion, with symbolic figures, human and bestial, dragons, griffins, &c.

The church that pre-eminently represents this Lucchese style in its grandeur and peculiarities is San Michele, whose situation in a large market place is most favourable, allowing one to walk round the entire structure.

The first impression made by it partakes of astonishment, so picturesque, rather than architecturally beautiful, so imposing, yet so opposed to recognised rules, are the aspect and details of its façade. Four tiers of arcaded galleries, the two higher considerably narrower than the other two, rise above the ground storey of blind arcades. Over the chief portal are low reliefs on a horizontal panel, griffins, a female centaur, a double-tailed syren, and animals in combat. All the available spaces above those arcades, on capital, cornice, and spandrel, are occupied by similar dream-like creatures in sculptured and inlaid work. On the apex of the gable-summit stands a quaint ponderous marble colossus of St. Michael overcoming the Dragon, with bronze wings and gold-bordered vestments; and at the lower angles are two angels

standing in Gothic canopies, their scale smaller, but both alike specimens of rude mediæval style. Viewed from the north or south-west, this façade of San Michele at Lucca presents a very singular appearance, the two upper tiers of arcades rising clear above the low-pitched roof of the nave, and therefore presenting to the severe critic an effect of falsity and unmeaningness; but it cannot be denied that this front, when seen from the due west, is one of much grandeur, its architecture exemplifying the northern imagination as it dominated in Italy after the Lombardic and Frankish conquests, little modified by the genius proper to the Italian mind. The cathedral has a façade of similar character, in this instance built over a deep porch or *loggia* opening from the spacious piazza in front of it by three noble round arches on piers of the compound type, and as, both in this cathedral and in that of Pisa, there is a well-developed triforium and clerestory to the nave, the façade is commensurate in height with the church, and on that account has a far more pleasing appearance when viewed from a north or south-easterly point.

The façades of the churches of Sta Caterina and San Michele in Borgo at Pisa are among the most exquisitely beautiful examples of the Italian Gothic style. The former was in all probability designed by Nicola Pisano, assisted by his pupil, Fra Guglielmo Agnelli, a native of Pisa, who received the Dominican habit as a lay-brother in 1257. It is especially interesting as showing how admirably the builders adopted the Romanesque fashion of the arcaded front to the style then prevalent. Over three semi-circular blind arches is an elegant range of Pointed arcades, with slender shafts and trefoiled canopies, broken by a circular window, once perhaps filled with tracery, but now quite plain, framed in a square of little half-figures. The whole of the gable is likewise arcaded and richly crocketed, and the tiles which cover its sloping sides have a remarkably pleasing effect.

At San Michele in Borgo the façade follows exactly the outline of that of the cathedral, is arcaded very richly in the Pointed style, and has the plain surfaces of the wall

behind the arcades inlaid with patterns in dark marble. In the churches of San Francesco, Sta Chiara, and San Pietro, at Assisi, and in the two most valuable Romanesque churches just outside the city of Toscanella, sixteen miles from Viterbo, we see another type of façade. These are all remarkable for the simple and truthful outline of their low-pitched gables—at Sta Maria, Toscanella, and San Pietro, Assisi, there is no gable at all—their grand western doors, and their rose windows, sometimes surrounded by sculptured symbols of the Evangelists. These façades are honourably distinguished by being in no sense shams; that of Sta Maria, Toscanella, being perhaps, in some respects, the most remarkable of all. The rose-window and the doorway below it are of the best early First Pointed; and as well as the angles of the wall are adorned with a dog-tooth enrichment, identical in its character with that which we see so frequently in our own thirteenth-century buildings. The circular window in this façade of Sta Maria at Toscanella is one of the most beautiful of the writer's acquaintance, even in France, that land of circular windows. Unfortunately, however, its beauty is lost internally, as the glazing, instead of being fixed in grooves so as to show one-half of the tracery outside and the other inside, entirely covers the window in one large sheet, an unpleasant Italian practice of which this is by no means the only example.

Somewhat analogous to those of Lucca and Pisa is the façade of Sta Maria della Pieve at Arezzo, one of those churches to which the ecclesiologist has some difficulty in assigning an origin, for although it has a Lombard character about it, it lies too far south to permit of its being classed with buildings of that province. The western front of this church is beyond question one of the noblest and most remarkable of its class in Italy, and would appear to have had considerable influence upon the architect of the developed Gothic front of Notre Dame at Dijon, being quadrangular and presenting several tiers of arcades over the entrances. At Dijon, however, one of those deep porches so common in Burgundy is formed under the façade, which is not a mere screen, but constitutes a kind of huge western tower, extending the whole breadth of the church. At Arezzo it is only a screen without relation to the structure behind it, and into which the three noble Romanesque portals open directly. Here we have four storeys. The ground storey is a blind arcade of five arches, three of which are pierced with doorways, admitting to the nave and aisles respectively. In the other three are open galleries carried uninterruptedly along the breadth of the façade. Of these, the first two consist of a series of round arches on slender columns, and the highest a colonnade supporting a horizontal cornice.

No systematic arrangement is evident in these openings, for the second stage of the elevation numbers twelve arcades, the third twenty-five, and the highest thirty, the arcades decreasing in width as they ascend. The slender pillars of these openings assume a variety of shapes, and not only shapes but sizes and materials, plain, fluted, twisted, and knotted. The capitals form a mixture of styles, frankly gathered with but little thought or skill from antique fragments and miscellaneous sources. Such a piece of work as this façade of Sta Maria della Pieve at Arezzo is one which, in the deficiency of authentic records, might be assigned to a period anterior to the thirteenth century, when the neighbouring cities were demonstrating the strength and grace of which the Romanesque of Central Italy was capable.

(To be continued.)

BRONZE AND IRON JAVELINS IN CARIA.

Communicated by Professor W. Ridgeway, F.B.A., to the meeting at Dundee, 1912, of the British Association.

In the "Early Age of Greece," Vol. I., I argued (1) that the culture of the Early Iron Age of Central Europe was that of the Homeric Achæans, who had brought it with them into Thessaly, where they were settled in Homeric times; and (2) that the older race and those who could not obtain the new metal had to content themselves with weapons and implements of bronze; and that (3) there was consequently a distinct period of overlap when bronze and iron weapons were in use side by side. This accounts for the fact that whilst the weapons in the hall of Odysseus are collectively termed *sideros*, yet in descriptions of individual combats the phrase "smote him with the bronze" (*chalkos*) is generally used. As the language of Homer is that of the older race, whose bards sang the praises of the Achæan lords, it is natural that poetic diction used the name of the older metal for weapons long after the new was in use, as indeed is the

case in everyday language, e.g., we speak of "instruction in musketry," though the Brown Bess musket has not been used in the Army for some sixty years. The tombs of East Crete have already given evidence for the overlap of bronze and iron swords. The "find" now described was discovered at Cnidus, in Caria, in 1911. It consists of six bronze javelin-heads, five iron javelin-heads of exactly the same type, a small iron knife, and one or two iron fragments, and a small whetstone perforated for suspension. This association of javelins of both metals puts it beyond doubt that weapons of both metals were in use at the same time, as is represented in Homer. If a bard had been celebrating the exploits of the owner of this set of javelins he would surely have said that he "smote his foe with the bronze" (*chalkos*), even though he had slain his adversary with one of his iron specimens.

COMPETITION NEWS.

RANGOON.—Messrs. Ogilvy, Gillanders & Co., agents, 67 Cornhill, E.C., have been advised by cable from the Rangoon Municipality that the time stated in Clause 14 has been further extended to March 1, 1913. The latest date for posting letters to reach Rangoon by that date will be by the Indian mail closing in London on Friday, February 7, 1913. This information is supplementary to the alteration announced in our issue of August 30.

WALES.—The Welsh Housing Association, as stated in our issue of August 30, arranged a competition scheme in connection with the Royal National Eisteddfod just held at Wrexham. The designs submitted by "Betterment" and "Ivy" were considered by the two assessors to be of equal merit, and the prize of £50 was divided equally. The authors of these designs were Mr. W. Eaton, A.R.I.B.A., Cardiff, and Messrs. Fair & Myer, of London, with Mr. Arvon Jones, of Carnarvon.

SEDILIA IN ST. MARY'S CHURCH, TEMPLE BALSALL.

TEMPLE BALSALL is so called from the Knights Templars, to whom it was given in the twelfth century by Roger de Mowbray. The church is a fine Early Decorated building, having a large interior consisting of a chancel nave without aisles or columns, with a modern roof and a small modern tower at the S.W. angle. The windows are all varied and have rich Geometrical tracery. There was formerly a porch at the south door, and there are traces of other buildings at the west end. The church was restored in 1849 by Sir G. G. Scott, R.A. The drawing by "Plato," which we reproduce, was awarded a prize in the monthly competitions of The Architect Students' Sketching and Measuring Club.

A POT-POURRI.

This plate may be taken as an exemplar of some of the many varied directions in which the art of architecture is exhibited.

COTTAGES AT WALLSEND.

As indicated on the plate, three of these cottages, designed by Mr. Edward Cratney, were awarded medals at the North of England Cottage Exhibition, and all show how very small houses can be artistically treated. Plans of one of the pairs of cottages now illustrated were given in *The Architect* for November 20, 1908.

INTERIOR DECORATION.—III.

By ALBERT E. BULLOCK, A.R.I.B.A.

GREAT BRITAIN.—II.

(Continued from last week.)

FORDE ABBEY, Dorsetshire, was a Cistercian monastery of twelfth century origin. Thomas Chard, a sixteenth century abbot, erected much of the existing Gothic work in 1528, and subsequently surrendered it upon the dissolution of the monasteries. It changed hands several times before becoming the property of Attorney-General Prideaux, whose second son, Edmund, caused the alterations designed by Inigo Jones to be carried out in 1650, of which the grand staircase, the dining-room, the saloon, the small drawing-room, and the oak bedroom form the principal additions, together with the chapel screen and other woodwork there.

Simon Gibbons is cited as having executed the wood-carving here. He was largely employed by Inigo Jones on his later work, and was skilled at carving the open or pierced balustrading and panel work typical of the period, of which there exists an excellent example in the ante-room of the Great Chamber at Hampton Court, which was formerly the chapel screen.

The chimney-pieces and ceilings (of which latter there is an immense area) at Forde Abbey do not exhibit the high standard of quality that is expressed in the wood-carving. The plasterer has taken more license than was usual in the time of Inigo Jones' vigour, and has returned to Jacobean vulgarities in some of the figure work. The main lines are obviously those of Jones, but the detail lacks his supervision.

The saloon is a very large and handsome room, the main beams of the ceiling curving down at their ends on to the cornice. The mural decorations consist of fielded panelling with carved mouldings. Large silk tapestries adorn the walls, having Scriptural subjects taken from the cartoons of Raphael. The chimney-piece is a typical one, the overmantel having a large central panel containing a painting of children at play flanked by carved pilasters, crowned by a broken curved pedimented cornice, which is crested by a large central cartouche with two smaller ones at the sides. Beneath the picture is a boldly carved frieze containing the familiar festooned mantling to a female head. The marble chimney-piece below is probably a later addition.

Amesbury House, Wiltshire, and Tyttenhanger in Hertfordshire both date from 1654. The last named was originally an ancient abbey which in 1547 was acquired by Sir Thomas Pope, the emissary of Henry VIII., under the Act of Dissolution. Sir Henry Blount entirely rebuilt the house in the middle of the seventeenth century, employing an architect whom we have little hesitation in placing. The detail of the staircase closely resembles Webb's work in the details at Forde Abbey, and may be said to be practically contemporaneous with it, while other features characterise with Webb's work at Thorpe Hall, especially in the treatment of the door cases. Amesbury with its pedimented portico and rusticated basement storey is typical of the houses subsequently erected by Campbell, Richard Boyle, and William Kent, and is probably another of the designs of Jones' son-in-law. Such houses never attained the palatial effect sought for, there being few examples which successfully emulate the skill of the master.

Thorpe Hall, near Peterborough, was erected for Lord Chief Justice St. John in 1656 by John Webb, who is said to have designed Walcot Hall and Uppington Manor in the same neighbourhood. The gardens of Thorpe are the work of Sir John Nasmyth in 1850.

In the interior we notice the same treatment of carved staircase balustrading with carved terminals to the newels. The ceiling to the Oak room is a large enriched circle of fruit set in a square ornamented with the guilloche pattern. The fruit is tied at intervals with linen work in knots and festoons on the surround reminiscent of the previous practice. Webb's early work does not compare favourably with that of his master. There is a want of care and sense of proportion in the treatment of his pilasters and capitals, and a certain coarseness about many other features, which indicate that he lacked the scholarly attainments of Inigo Jones and failed to grasp the essentials of good design and decorative fitness. He apparently grew out of this as he increased in years, and his later work can be criticised more favourably.

Ramsbury Manor, Wiltshire, was one of the residences of the Earls of Pembroke, dating from Elizabeth's reign. It was practically rebuilt about a quarter of a century later than Wilton in a style that is a great advance on Webb's work at Thorpe, and closely resembles the finish of Melton

Mowbray. There is nothing offensive in the work; it is just a delightful example of Charles II. period, which when pure is the very best period of English domestic architecture. The chimney-piece in the saloon is lighter in detail and more graceful in design than the work of the previous generation, the carving being of the nature of the work of Oakley, Grinling Gibbons and Samuel Watson, whose carved limewood masterpieces are notorious.

This style was in vogue about the time of the Great Fire of 1666. We see it in Talman's work at Chatsworth and Hampton Court Palace, in Wren's work at St. Paul's Cathedral and the City churches, in the chapels of Pembroke and Trinity Colleges, Cambridge, and elsewhere.

Roger Pratt, the architect of Old Clarendon House, which was originally built on the site now occupied by Old Bond Street and Albemarle Street in Piccadilly for Edward Hyde, Earl of Clarendon, was knighted in 1668. He was educated at Oxford, and was apparently in extensive practice at this time, being employed upon the rebuilding of many town residences. He was the architect of Lord Alington's house, Horseheath, Cambridgeshire, demolished in 1800.

Wren was in Paris at the time of the great conflagration, where he appears to have met with Bernini. Two years previously he had submitted designs for the Sheldonian Theatre, Oxford, where he eventually employed Streater to execute a series of paintings which will ever remain a credit to that remarkable English artist.

Wren was born at Knoyle, in Wiltshire, and was about thirty-five years old when he prepared his plan for rebuilding London, apparently in competition with Evelyn, both of whose designs were submitted to the King. Wren's design is preserved in the All Souls College collection. His designs for the new cathedral were not presented until 1673, and the building was commenced two years later, being completed in 1710. As regards the interior decorations to the domes, Wren's original intention was to use mosaic as the agent, being strongly opposed to painting. Emmett's engravings in Longman's "Three Cathedrals of St. Paul," made in 1702, indicate such a treatment for the pendentives below the Whispering Gallery. Many designs were subsequently made for the decoration of the Great Dome by Streater, Thornhill, Stevens, and, more latterly, Sir William Richmond.

It is extraordinary with what horror coloured decoration was held in the minds of the populace at this time. Frescoes and paintings were everywhere assiduously covered up with whitewash or plastered over, resulting in the "discoveries" we occasionally hear of, which reveal the past glories and leave but mutilated frescoes for the awe and wonder of the curious.

Grinling Gibbons, who was born at Rotterdam, is said to have worked under the architect Etty, of York, prior to his patronage by Wren upon Evelyn's introduction. His work eventually became stupendous if half of that attributed to him is authentic. Like Nicholas Stone, however, he was not without his small army of assistants, who include Seldon (killed at Petworth), Watson, who spent most of his life at Chatsworth, Henry Phillips, who worked with Gibbons at Whitehall, and several foreign sculptors, who assisted him in stone and marble carving, as Dyvoet of Mechlin, Laurens of Brussels, and Arnout Quellin of Antwerp. The pedestal of the Charles I. statue at Charing Cross, usually attributed to Gibbons, was executed by a sculptor named Joshua Marshall, but he may also have been an assistant and executed the work under Gibbons' directions.

Gibbons' statuary includes the bust of Sir Peter Lely for St. Paul's, Covent Garden (destroyed 1795), Baptist Noel, Viscount Campden at Exton, the pedestals of the two statues to Charles II. at Windsor Castle and the Royal Exchange, the bronze of James II. at Whitehall, and the font of St. Margaret's at Lothbury. There is at Chatsworth a case of his carving very beautifully executed, which consists of game, a lace handkerchief and medallion most delicately carved in limewood.

It is only possible to mention a few of his works, which are very extensive, embracing widely divergent districts. The vestry of St. Lawrence Jewry, which with the church was rebuilt by Wren in 1677, contains some of his carving, and an exceptionally fine ceiling with a painting by Spagnoletti, representing the Martyrdom of St. Lawrence, which was saved from the Great Fire. The church is of ancient origin, and had been restored and highly decorated in 1618. Upon the reseating of the interior in 1866 the north gallery was removed. The organ is an old one, by Harris, reconstructed in 1875 by Gray & Davison.

Grinling Gibbons is said to have been responsible for

the fine carvings in the Board Room of the New River Company's offices in Rosebery Avenue. The room is the finest of its kind in London. The ceiling contains in the large centre oval a painting of Sir Hugh Myddelton, surrounded by various figures, and his arms are modelled on the ceiling in a circular wreath, and those of Greene on the opposite side. The ornament to the large oval consists of fruit, flowers, and birds all picked out in colours, and having an average projection from the soffit of the ceiling of 4 inches. The smaller panels are descriptive of scenes on the New River, the execution of which was about 1687.

Gibbons worked with Nicolas Alcocke and William Emet on the carvings for the wainscoting of Queen Mary's Gallery at Kensington Palace between 1689-91, the joiners being Henry Hobb, Alexander Forst and a certain Gerard Johnson, described as a cabinet maker, who executed several overmantels in the King's dining-room and the aforesaid gallery for £100. (Vide "Guide to Kensington Palace," by Mr. Ernest Law, F.S.A.)

Building was in active progress throughout the country at this time, and we find the Scottish architect, Sir William Bruce, erecting a house for himself, Balcasky, in 1665, and in 1670 making alterations to Ham House, where he employed a German to make what is believed to be the first sash windows seen in England. In 1671 he was associated with Robert Mylne at Holyrood Palace.

Drumlangrigg, probably from his design, was built in 1675, and is noted for its steeply terraced formal garden. Kinross House was from designs made by Bruce in 1685.

Tredegar Park, Monmouthshire, where Charles fled from Naseby in 1645, had been in the family of the Morgans for many generations. The hall is now the only remnant of Tudor days. Most of the present building is in brick and stone of the time of Charles II., and presents within the most complete expression of the skill of the craftsmen of this time. It is probably one of the last and best of the works of John Webb prior to his decease in 1672.

The staircase has points in common with Thorpe and Ramsbury, while the floriated twisted columns to the porch have an echo in those separating the tapestries in the saloon at Forde Abbey. These alterations were probably carried out in 1670 at the time of the occupation by William Morgan. No expense appears to have been spared to produce the very best representative example of the period, and although subsequent alterations were effected, much of the original character remains. All the principal reception rooms are panelled in oak carved in the most lavish manner. Both the Gilt and the Brown rooms excel in this respect; the ceiling of the latter is a later addition, except for the portion near the walls. By comparison with the fine ceiling to the Gilt room, the original of the Brown room must have been a very bold work indeed.

Sudbury Hall, Derbyshire, which has been frequently altered from Elizabethan times, contains a handsome staircase similar to that at Tredegar Park. The pedimented door leading to the saloon and certain details of the ceilings suggest the hand of Webb, while the carving in the drawing room, the ceiling of the Long Gallery, and many other features indicate the later work of Gibbons and Wren. The overmantel in Queen Adelaide's room is apparently of earlier design than the accompanying ceiling. The ceiling painting in the north hall is from the brush of Verrio and in his best vein. There is a certain similarity in the decorations of the interior, which resemble work of the same period existing at Cassiobury Park, Watford. The house was originally owned by a branch of the Vernons of Haddon Hall, of which Sir John Vernon was the first member to establish himself at Sudbury.

A very unusual modillioned ceiling is to be seen in a house formerly existing in Clare Market, London. The motif is based on the ivy plant, the main stem of which forms the bed mould of the cornice. Although it is quite out of style with the majority of the current work, having been erected in 1670, it is, nevertheless, of much interest, anticipating the style of the late Mr. J. Bodley.

Thoresby House, Nottinghamshire, erected for the Duke of Kingston by William Talman in 1671, is one of the earlier works of this architect, whose name is chiefly associated with his admirable efforts at Chatsworth. He erected Dyrham House, Gloucestershire, in 1698 for Sir William Blathwayt. Talman died some twelve years before Wren and has been rather overshadowed by this mammoth architect. His work, which is of great originality, is always dignified and stately in effect. There is a certain grandeur about the remaining side of his work in the courtyard at Chatsworth, which equals if it does not surpass the work of any other architect of his day.

The Hall of the Brewers' Company in Addle Street, London City, is one of the earliest livery halls of which London possesses so many fine examples. The parlour was panelled in 1670, and the screen in the Hall bears the date 1673. Messrs. Way and Norman give an exhaustive historical description of this work in "Ancient Halls of the City Guilds," published in 1903, from which it appears that the guild was of very early foundation, the records being originally kept in Norman-French until the reign of Henry V. The company was incorporated 16th Henry VI. (1438) and confirmed 19th Edward IV. by the name of "St. Mary and St. Thomas the Martyr," and again by Elizabeth (1562 and 1579) and by Charles I. (1639). James II. gave a new charter in 1685 (subsequent to the building of the new Hall) after the destruction of the previous building by the Great Fire. The premises are spacious for a building occupying such a central position in the City, and entrance is obtained from Addle Street through a pair of carved oak doors giving access to a large stone paved courtyard in which a flight of stone balustraded steps leads one to the Hall situated on the first floor. The principal panelled rooms include the large Hall entered through a screen, with well proportioned windows filled with leaded lights and stained glass decorated with the coats of arms of various early members of the Company. The cresting to the panels separating these windows is carved with arms and figures of varied device, while the tables and chairs have equal interest. The parlour is approached at about the centre of this Hall and is lit by means of oval windows on one side. The panelling, chimney-piece and doors are all of exceptional interest, and from the inscription contained in the overmantel we learn that the Lord Mayor, Samuel Starling, caused the room to be wainscotted.

The arms of the Company are:—*Gules a chevron or, charged with three barrels sable hooped or, between three pairs of barley garbs salterwise proper.*—CREST. *On a wreath a demi-Moorish woman couped at the knees proper, her hair dishevelled or, habited sable, frettée argent; her arms extended, holding in each hand three ears of barley of the second.*

Motto: "In God is all our trust."

The oval table in the parlour was in olden times used on the Company's barge. The kitchen is believed to have escaped the Fire, and contains a lead cistern bearing the date 1671. The writer measured the premises some years back, the drawings being published in *The Architect* for August 26, 1910.

The building was repaired in 1828 by W. F. Pocock, and the houses in front were rebuilt in 1875.

(To be continued.)

HOUSES PAST AND PRESENT.*

(Concluded from last week.)

IN close connection with proportion and relation is what may be called "scale." Perhaps the best example of this is the Japanese garden, which appears as a miniature landscape, where the whole illusion depends on the proper proportion of trees, mountains, and lakes on a small scale. It is chiefly the recognition of scale which makes the old cottage so attractive. In these humble dwellings the inevitable smallness of the plan is accepted, and appears right, because every feature and detail is made correspondingly small. The windows, doors, and staircase are all of the cottage kind, and everything is in scale. In the modern cottage or small house the traditions of villadom suggest that smallness is an evil not to be accepted with due humility, but to be protested against wherever possible. If the rooms are contracted on plan they may still remain lofty—windows may be made large, and the staircase can be made a feature and so on. And the final result is that, instead of a comfortable and comely cottage, the building appears to be vainly struggling against inevitable limitations. Nothing is so important to remember in cottage building as that the smallness of the parts increases the apparent size of the whole. The beauty of the old cottage seems to consist largely in the frank acceptance of limitations. Necessity is made a virtue indeed, and the designer, since he must make a small thing, chooses to fall in love with smallness. Since, too, he can only use simple homely materials, he will make homeliness and simplicity his ideals, and so successful is the result that these simple old cottages often put to shame their more pretentious neighbours.

The planning of old houses may next be briefly considered.

* A Paper by Mr. M. H. Baillie Scott, read at Carpenters' Hall.

In the earliest times the houses consisted of one room. It was unicellular, and its development consisted in the formation of secondary specialised cells, or rooms, grouped round the central apartment. In the old English manor house this development proceeded in two opposite directions from a central axis. This axis was the passage, which went right across the house at the lower end of the hall or main apartment. On the one side of this were developed the apartments for service, while at the opposite (or dais) end of the hall the withdrawing rooms and all that part of the house which was devoted to the elegancies of life were added. As these accessory apartments increased, the functions of the hall were gradually absorbed by the special apartments, and so, like the unused tail of the crab, it gradually shrank to the dimensions of a mere passage with a staircase in it. It still retained its old central position as the axis of the house, and in this condition we find it in the eighteenth and nineteenth centuries in the plans of the majority of houses, with the difference that, on restricted town sites, the kitchens have been pushed from their positions on the side of the hall to the back.

And so, while admitting the reasonableness of the plan which has reduced the hall to a passage merely, we find the type of house which has specialised rooms *only* not entirely expressive of our needs. It lacks focus and coherence, and as we pass from one specialised room to another specialised room never can we say, as of old, "I am here in the house." We never achieve more than the occupation of a compartment. We must either study in the study, dine in the dining-room, sleep in the bedroom, or withdraw to the withdrawing-room. And so we sigh for the old houseplace or hall as a place to foregather and dissemble in. And we sigh for it all the more if we must needs live in a small house, because then our little specialised rooms are each and all too small for comfort; and, as we go from one little plaster box to another little plaster box, it occurs to us that in the confines of this bit of space we have walled and roofed in, surely there is room for one decent apartment, for which it may be worth while to sacrifice something. Let us give up studying in the study, withdrawing in the drawing-room, or even dining in the dining-room to get that. And thus we arrive at the conclusion that the requirements of family life in the small house suggest a conception of the house which shall contain at least one good-sized central room, and, for the sake of this, accessory rooms should either be deliberately eliminated or reduced to a recess in the main apartment. The multiplication of small rooms in the small house is, after all, no expression of actual needs. It is mainly a survival of the snobbery of the Victorian era, when it was the fashion of the Mrs. Wilfers of the day to ape the customs of the rich and great, and, since the reception of visitors was considered the main function of the house, it was necessary to have "reception rooms"—a tradition which still survives in the curious phraseology of the house agent's advertisements. It is also necessary to make a good advertisement from the house agent's point of view; to have the full complement of reception-rooms, regardless of sizes, which could always be "measured into the bay." Do we not know exactly the kind of house that phrase conveys? Everything the house agent affirms of a house is "measured into the bay," including the distance from the station! But why should the plans of our houses be dictated by Mrs. Wilfer and the house agents? It is doubtful if the general public would endure the average modern dwelling were there not apparently an ill-founded idea that houses grow into certain inevitable forms, much as trees do, and that the small house of to-day is the outcome of necessary conditions which make it impossible for it to be beautiful as the old houses were and planned for the comfort of its occupants.

In the planning of the modern houses let us imitate the old house mainly in this: that its plan shall be the outcome of our requirements, and, while so satisfying material needs, it shall also minister to something more than those. Let us design it from within, outwards, and let its outward aspect be the natural expression of its inward grace.

In the matters of decoration and furnishing much may be learnt from the old house. Situated, perhaps, in beautiful and romantic scenery, we shall find, on visiting it, that all those impressions of beauty we received from the hills and trees are confirmed and continued in the house and its adornments. Both house and country seem to belong to the same great world of thoughts and feeling. But if we are visiting a modern country home, or an old house which has been devastated by the trade art of a furnishing firm, how painful is the sudden transition from the soothing influences of fine natural scenery to those "reproductions of the periods" (as they are understood by the modern cabinet maker) which

confront us as we enter the house. Outside on the moorland we were steeped in that deep, faithful earnestness which seemed to brood over the land. Here within in these Louis the Something drawing-rooms, or Jacobean dining-rooms (with machine-made panelling and ancestral portrait complete) we can only wonder and despair to think that so many people nowadays can only make their homes like a bit of a cabinet maker's shop, where just enough art is introduced to bait the hook for the purchaser. It is a perennial puzzle, this modern furnishing. Why do people, otherwise sane and intelligent, apparently delight in surrounding themselves with all kinds of unnecessary and unbeautiful things? There is something hopelessly illogical, too, about the "period" room, for it seems to demand for its completion a corresponding correctness to period in the dress and speech of the occupants. In all these periods of the past, which we delight to copy, there are certain features which were but passing fashions, and certain qualities which belong to all time. The features were generally the weaknesses and mere mannerisms of the style, which are better forgotten, and yet it is in copying just these features that the modern furnisher thinks he is capturing the elusive charm of the old work. Copy if you like the old methods of workmanship, because they were the eternally right methods, or copy the old proportions, or any other essential or vital principle which is right yesterday, to-day, and to-morrow, but let the superficial saliences of style go. Within limits such as these we may rightly design our modern rooms on the lines of old ones, imitating nothing in them but the fundamental principles on which their beauty depends. In such work we shall find space for some expression of that personal initiative which was the characteristic of the old work. We, too, may invent and create, and, in the expression of our joy in so doing, add the essential note to the room.

Having considered some of the vital characteristics of the old house, and having tried to penetrate the secret of its beauty, we may next ask ourselves what are the main conditions of modern life which make it difficult—not to imitate the forms of the old house, but at least to practise the methods which led to its beauty.

One of the foremost is that obsession of Rome and the academic tradition, under the spell of which authority art becomes tongue-tied, and all the spontaneous and human peasant art of the past is replaced by trite formulas. I do not wish to take a narrow view in this matter. I fully appreciate the great powers shown by our designers in modern Classic buildings. But their appeal is largely discounted by the knowledge that theirs is a one-man art, and that they are only realised at great cost by the unremitting and uninspiring toil of unnamed hordes of workers. How different is the impression conveyed by the Gothic building, where the whole structure seems to have been evolved by a band of intelligent craftsmen, each contributing his share to the beauty of the whole. Such a building is a living organism rather than an academic composition. And so, whatever kind of building we evolve in the future, I think it should be one which includes in its scheme—as Gothic work did—that kind of happy human expression of the creative instinct of the workman, which the Classic tradition crushes out of existence.

Having once rid ourselves of the nightmare obsession of the master pieces of the past, and having given up all idea of becoming little Christopher Wrens or little Michel Angelos, we must next demand a reform in our building by-laws which at present make cottage building impossible. Apply a set of these rules to any beautiful old English village and its beauty would melt away. The overhanging gables and low-ceiled homely rooms of the farmhouse would be anathema.

It seems reasonable that architects who have made a special study of building should be allowed to frame their own rules, and not be made to submit to regulations which are condemned by the better informed.

In any reform of modern building which may be initiated let us give up all vast and ambitious attempts to lick creation. Let us eliminate our mean streets, and, taking care of the pennies of our building currency, let us leave the pounds to take care of themselves.

As an architect, I find myself with a rooted prejudice in favour of beginning from the foundations upwards, and not from the roof downwards. Give me a universal and common speech of good building, without any architectural nonsense about it, which will lend a homely beauty to the rank and file of building, and then our great buildings will grow naturally out of that. In other arts the value of simple statement is recognised. We admit its supreme merit in literature, for example. Why, then, in building alone, in

order to command the approval of the critics, is it necessary to be bombastic and diffuse, dragging in the spoils of Rome to give a kind of spurious exterior effect to a building whose real structure is ferro-concrete? Would it not be better, for a change, to give up the rôle of man, the imitative ape, and to take up the nobler and more difficult part of man the creator?

Once the building craft is thus established, we shall no longer find it necessary to escape disaster by confining ourselves in the strait waistcoat of the complete and finite formal scheme. Having found at last the right road, we shall be able to take it, with the assurance that all the accidents which may happen to us there will be happy accidents and joyous adventures, and thus we shall be able to take our chances in the casual manner of the old builders, and so avoid the dismal and trite monotony which is the outcome of the usual modern conception of "town planning" evolved under the auspices of academic committees of fine arts.

But probably the most essential reform required for the re-creation of building as an art is the education of the craftsman by the formation of guilds, where art would be approached from the workshop, and not from the art school, with its dilettante methods. The art school has a way of spoiling horns without making spoons, and its academic traditions are fatal to that folksong kind of beauty which was once the possession of the people. Perhaps one of the latest survivals of this art was in the carving of the old figure-heads on our ships. How delightful it would be in our villages and old towns if, when a memorial was required for a street or square, instead of importing something trite and academic, we could produce locally a gaily-painted wooden effigy which would gain a new kind of beauty as its colours weathered. And then, suppose on entering the village church if, instead of seeing there the usual dull trade carved figures on the chancel screen, designed by the eminent architect, we found there, again, the expression of this local art bright with colour and gay as a wood in spring.

This kind of art would mean far more than the varied interest it would give to our towns and villages. For it would stimulate that creative instinct so long stifled, and men would find joy again in the work of their hands.

And since, after all, building is the expression of ideas—be it the sublime devotion which created the Gothic cathedral, or but the commercial greed which created the modern slum—it may at least be safely assumed that any great advance in national ideas must be reflected in our buildings.

Let us hope that, however deeply we may fall into materialism in the business world, that in the home, at least, art may make its last stand; and that we shall find expressed there those great ideals which have made houses in the past almost sacred places, full of a deep and quiet beauty, in tune with infinite things. The love of home has always been an English quality. Is it not worth while to try to obtain again homes as worthy of our affections as were the houses of the past?

EXPERIMENTAL SCHOOLS: THREE NORTH-UMBERLAND EXAMPLES.*

In designing modern school buildings the knowledge required by architects falls under two distinct heads: (1) That required for housing the children under the healthiest hygienic conditions, while at the same time safeguarding the interests of the teacher by giving him a well-planned school so that he can realise his best self and his maximum power and efficiency, and (2) that required where special circumstances arise for dealing with the structure, either with regard to its stability or from the point of view of expense.

In the following short paper I shall deal with the second head, subdividing it into two clauses as follows: (a) The erection of structures where some method has to be employed to counteract as far as possible the effect of pitfalls or subsidence due to colliery workings, and (b) the cheaper schools movement.

In many cases in colliery districts it is not possible, owing to expense and other reasons, to acquire support for the surface of the site, and, therefore, special precautions are necessary when designing the buildings. The new school at Choppington, Northumberland, opened about a month ago, is a very interesting example under this class. In this

instance the street or road adjacent to the school site forms what is known as a "barrier" between two collieries of different ownership, so that the school is placed in as treacherous a position as possibly could be chosen.

It is customary, I know, for architects to lay a large raft of reinforced concrete over the whole building area. I am of opinion, however, that this is a wrong form of construction to adopt, and certainly in the case of this school such a treatment would not have materially assisted in minimising the risk of subsidence. Some other means, therefore, had to be adopted, more economical and efficient. From observations and experimental tests carried out, I came to the conclusion that some system of reinforced brickwork would meet the case, as this mode of construction would render the walls monolithic and make the building infinitely stronger than if built with ordinary walls. Briefly, the system is to reinforce the mortar course with a wire mesh of best quality mild steel wire, galvanised, and having tensional wires running its entire length. The action of the wire mesh when resisting tensional stresses is to reduce the sectional area, and this tends to close the meshes and compress the mortar, so that the latter develops its greatest strength—namely, resistance to compression. The resistance arrests the tensional stresses in the wire, and is arrested by being held firmly by the bricks above and below it. With the mesh embedded in the mortar joint the latter becomes the strength of the wall and not a filling only, and the continuous bond renders the wall monolithic.

Reinforced brick walls, by reason of their resistance to tensional and lateral stresses, do not require to be of the same thickness as ordinary brick walls, whose strength is only in proportion to their weight. Heavy brick walls are only as strong as their foundations for weight-carrying purposes, and, should the foundations settle unevenly, cracks will appear throughout the building, but by reinforcing the walls with this mesh 10 or 15 feet can be taken away from underneath the building, and the walls will still remain intact and span across like a girder.

I applied this form of construction to the Choppington school, which is, I believe, the first complete school of its kind in the country. Here you have a school built in three sections completely independent of each other, with the foundations and walls reinforced, the foundations on the Hennebique system and the walls of the superstructure reinforced with wire mesh of best quality mild steel wire, galvanised, and having tensional wires running its entire length. The school is built with a 9-inch cavity wall in place of the ordinary 14-inch, and consists of a 4½-inch outer wall, 1½-inch cavity, and 3-inch brick on edge inside. For the classroom walls I have used a 9-inch cavity wall, consisting of two brick on edge walls with a 3-inch cavity between, and the partition walls are 3-inch brick on edge reinforced. The cost of the school worked out at £11 16s. a school place, which is practically the cost of the better-class schools in Northumberland. All the walls are built in cement mortar gauged 2 to 1, and every precaution has been taken to insure the safety of the children.

The other two experimental buildings I intend referring to come under the head of the cheaper schools movement, and are both interesting examples.

The first example is the new school at Barrington Colliery, about sixteen miles from Newcastle-on-Tyne. This school is constructed of wood on brick foundations. The brick foundations are reinforced in two alternate courses with three rows of best galvanised mild steel wire mesh, similar to that used in the Choppington school. This mesh is in 2½-inch widths laid longitudinally along the total length of brickwork. The wood superstructure is securely fastened down by wrought iron bolts and plates embedded in the foundations. The outside framing is formed with 4-inch by 3-inch posts, covered with a layer of felt and 1-inch G and T boarding, fixed horizontally on the outside, and on the inside match-boarding covered with asbestos sheeting to form a dado. Above this dado the asbestos sheeting is fixed on to the 4-inch by 3-inch posts. The corner posts to the building are 4 inches by 4 inches. The floors throughout are of wood joists and boarding supported on sleeper walls. The ceilings are formed with asbestos sheets, and the roofs are covered with Eternit slates laid on spars covered in the first instance with felt. This school works out at £6 10s. a school place.

For colliery districts where the life of the colliery is uncertain, I would strongly recommend a school of this description. It is considerably cheaper than a brick or stone building, and with the exception of the main walls and floors is finished exactly similar to one. A low-pressure water apparatus is installed. Ample heating margin has been allowed, so that the children will not feel cold in winter.

* Abstract of Paper presented to the York Congress of the Royal Sanitary Institute by G. Topham Forrest, Lic.R.I.B.A., Education Architect, Northumberland County Council (Member).

MODERN EUROPEAN ARCHITECTURE.
GERMANY.

[From *Berliner Architekturwelt*.

YACHT CLUB-HOUSE ON THE WANNSEE.—Herr OTTO BERLICH, Architect.

All other materials, hardware and sanitary goods are of the best description.

The other experimental building is the new school erected in the village of Hartley, on the East Coast of Northumberland, about ten miles from Newcastle-on-Tyne.

The population consisting chiefly of miners employed at collieries outside the parish, an application was made to the Board of Education for permission to erect a wood and iron building. The Board, however, were only prepared to recognise a wood and iron building for a limited period, pending the erection of a permanent building, and suggested that a more comfortable and satisfactory building than that proposed should be erected, which would at the same time be less expensive than a stone or brick building, and they invited me to discuss the matter with them. A conference was ultimately held in London between the departmental officials and the officials of the Northumberland Education

Committee. While in London I paid a visit to the sanatorium at Harrow, and was very much struck with the novelty of its construction, which I thought very adaptable for educational buildings. I submitted designs on similar lines to this building, and these received the approval of the Board of Education. The following is a description of the school:—

The school is a timber framed building with slab casing, ferro-concrete foundations, reinforced with $\frac{3}{4}$ -inch steel rods and expanded metal. It is constructed of $4\frac{1}{2}$ -inch by 3-inch framing fixed to foundation, with holding down bolts at angles and about 8 feet apart around the building, angle posts of 7 inches by 4 inches framed to horizontal timbers fixed to all external angles, doorways, &c., ordinary framing $4\frac{1}{2}$ inches by 3 inches with $4\frac{1}{2}$ inches by 2 inches alternate studdings; 9-inch by 3-inch glazed ware air gratings fixed at base of all framing, and holes bored through timbers for

circulation of air throughout the whole of the framing. Bituminous damp course is fixed below sole piece of framing. Two-inch "Fram" slabs fixed to framing on outside, rendered over surface with cement mortar floated to an even surface, and rough cast with mixture of slag and pea gravel. One-inch internal "Fram" slabs nailed to framing, floated and skimmed with washed hair lime and putty, and finished with putty and plaster throughout. A 3 feet 6 inches dado is formed with Portland cement back and finished with Keene's cement, face trowelled and smooth. The roofs are boarded with clean redwood grooved and tongued boarding, and slated with asbestos tiles laid diagonally and fixed with copper rivets.

The cost of the school works out at about 5½d. per foot cube for the building alone, but the fact must be taken into consideration that the building internally is finished exactly similar to one of brick or stone, and that owing to the exigencies of this site, and bad drainage arrangements, it was found necessary to instal an accelerated hot-water installation, and other extras were also incurred. Provided a school of this description was built on a suitable site, it should be possible to erect a building which would work out at 5d. per foot cube, or even under that figure.

The school is designed to accommodate 300 scholars, and the price per head works out at £6 16s. 6d., but to this price must be added £525, being the cost of out-offices and boundary walling, which are of brick and stone, similar to a permanent building, and also the tar macadam playgrounds and drainage.

THE ART OF THE THEATRE.

A YEAR ago Mr. Edward Gordon Craig held, at the Leicester Galleries, Leicester Square, W., an exhibition of drawings and models for "Macbeth" and other plays. In referring to it we remarked that both drawings and models showed individuality of an almost bewildering kind, and that to a spectator without a key they must be more or less puzzling. This week a very similar exhibition has opened in the same galleries, though this time all the models and a large proportion of the drawings are concerned with "Hamlet." From a practical point of view there is this great difference between the two, that, whereas the "Macbeth" designs were made at Sir Herbert Tree's request for the production at His Majesty's Theatre, and were then withdrawn by Mr. Craig, the "Hamlet" designs represent his production of Shakespeare's tragedy in November last at the Théâtre Artistique of Moscow.

The besetting sin of a present-day production of Shakespeare, at any rate in the West End of London, is over-elaboration and a rejection of dignity and simplicity. People flock to "see" the play rather than to "hear" it. Surely the play should be the thing, not the tableaux or the entr'acte music, the costumes, scenery, or any other accessory. A no less insidious danger is the "all-star" caste, with its absence of unity and of inter-dependence. But the latter consideration is too far removed from the concern of this journal to call for discussion here. It is, however, within our province to discuss the setting. Architects should be at least qualified to pass judgment on the archaeological correctness of the scenery in a Shakespearean play. Under present conditions it is wisest for the profession not to exercise their critical faculties, and to accept the stage-manager's interpretation of architectural periods without demur.

Mr. Gordon Craig has revolted against the modern realistic theatre of the Continent, which, he says, forgetful of all the laws of art, sets out to reflect the times and thrusts upon people a grotesque and inaccurate representation of the outward and visible life, with its beauty left out. He asserts that "the duty of the theatre (both as Art and as an institution) is to awaken more calmness and more wisdom in mankind by the inspiration exhaling from its beauty." The theatre towards which he is striving, and which he declares to be irresistibly approaching, aims not so much at effectiveness as at beauty—and abstract and intellectual beauty rather than a physical and visible one. He would like to subordinate the players to the play; he even looks forward to a time when actors, recognising that they have not ideal heads for their particular part, will once more wear masks. In the exhibition are about a dozen designs for such masks—a device which he considers to be the only possible means of expressing justly the outward form of the poet's creations. The idea appears to us eminently justifiable in the case of the Ghost, the Player-King, or even of Claudius; but how Hamlet himself, the creature of a thousand emotions, could be rendered with one fixed ex-

pression is beyond our comprehension. When Mr. Craig began his preparation for the Moscow production he set himself to discover how much of the exterior part of the actors' heads would need to be changed before it was ready for use in the play. After drawing eight heads, he says he gave up the attempt, as he began to realise that every head was either too long or too broad, too pinched or too flat to be transformed into the ideal head for this ideal play. It may be pertinently asked, "What shape is the ideal head?" and "Who is to judge it in default of any instructions by Shakespeare?" Mr. Craig suggests that Mr. Forbes-Robertson has an ideal head, and that until the merest super has got a similar one the play can only be done justice to by employing masks. Obviously the ideal Hamlet head to a Londoner might not appeal to a Moscow audience as being ideal at all. Would it be possible to devise a mask which would be a common denominator all over the world?

A friendly critic has declared Mr. Craig's drawings to be, for the most part, an absolute nightmare jumble of Blake, Sims and Beardsley, with a dash of the Post-Impressionists. This seems a little unfair, because each one of them is unadulterated Mr. Gordon Craig. We do not claim to understand a single sketch, at least hardly one, or to have derived a single lucid idea. But that confession is made with deepest humility. This artist must be an electric battery of inspiration to anyone in sympathy with him, and who can comprehend such a remark as "without trouser pockets Hamlet is no longer possible on the stage"? It is disquieting to wander from drawing to drawing and back again with scarcely a glimmer as to what they mean.

With a sense of relief we turn to the seven models. Mr. Gordon Craig is not only an artist; he is also an inventor, and a very good one too, we imagine. He, in the most practical manner possible, has patented an idea for stage scenery. Mr. Craig preaches simplicity, and, unlike many preachers, also shows how to attain it. The invention consists of self-supporting folding screens which may be changed from one to another of a thousand shapes in a very few minutes, or even seconds. The surface is left quite plain. Each model is a triumph in the art of suggestion; the aim to produce a mood susceptible to the words and action for which the scene will be a background. The grim battlemented castle wall, the sombre room of state, and a brightly-lighted circular columned hall are all readily obtained from these screens. In all there is an element of mystery, of something intangible beyond the stage, which piques the curiosity and allows each imagination play. Accessories are reduced to their minimum.

Mr. Craig is a pioneer, some call him an iconoclast. He is certainly a whole-hearted enthusiast, and in his devotion to his ideal invites actor-managers to sample his wares for nothing. No. 62: Suggestion for a new "Shakespeare" stage, bears this note in the catalogue:—"Try it! the idea won't cost you anything now that it's on the counter and nobody is looking. And if you don't take it somebody else will. Do you want me further to explain it to you? Well . . . the explanation is under the mount." It must, however, be added that another part of the catalogue clearly states that the copyrights in the exhibits are strictly reserved, and that the prices may be obtained on application at the desk.

NONCONFORMITY AND ARCHITECTURE.

By MARTIN S. BRIGGS, A.R.I.B.A.

WHATEVER is to be the trend of events fifty years ahead, it is probable that the present age in England will be considered remarkable by historians of the future in this respect at least—that Protestant Nonconformity has become very much a power in the land. It has indeed become powerful enough to render its very name something of an anomaly, for the number of people who do not "conform" in the accepted sense is rapidly increasing, and only a proportion of them are members of the Evangelical Free Churches. Admitting that mere disagreement with the dogmas or ritual of the Church of England does not, nowadays, imply the eccentric or fanatical attitude it was once supposed to do, one must assume some sort of positive belief far more important and far more sincere than is worthy of such an out-of-date nickname.

Nobody can be altogether ignorant of the manifold influences which this change is bringing to bear on every aspect of our national life—on our politics and on our social outlook especially. Nonconformity is an enormous political force of increasing importance, and this even its most bitter critics are prepared to concede. Following its trail

MODERN EUROPEAN ARCHITECTURE.
FRANCE.[From *La Construction Moderne*.PRIVATE HOUSE, RUE PIERRE CURIE, PARIS.
Mons. HENRY GUEDY, Architect.

through one byway of civilisation after another, a thinking man after a while finds himself considering whether or no it has seriously affected the art of this country, and if so whether for better or worse. The most obvious and on the whole the most satisfactory answer will be found by studying the buildings which it is erecting in increasing numbers all through the country.

There is nothing so easy as sweeping condemnation, and condemnation is usually most sweeping when it is most thoughtless. It has so often been said that Nonconformist architecture is beneath criticism that critics have never reflected as to whether this is a desirable or a remediable state of things. But even abuse is sometimes preferable to cold neglect, and cold neglect is unfortunately the prevailing attitude of the architectural press. It is a rare thing for an unconsecrated church, as its opponents charitably call it, to be illustrated in such pages—rarer still for the drawings to bear the name of an architect of note. And yet it never seems to have occurred to the members of a profession who discuss and exhibit all their works among themselves with singular avidity as in any way curious that so large a mass of modern building is simply ignored. Go into a certain

bookshop known to these people and you can buy illustrated monographs on every class of building, from skyscrapers to pigstys, on infectious hospitals or suburban villas, while the workman's cottage is at the present moment perhaps the most widely-discussed of all. That a book was published on Nonconformist architecture some time ago the writer is fully aware. What perplexes him, as a member of the craft himself, is that it is not only unknown to the majority of members of his craft, but so utterly without interest to them. You have architects on all sides—genuinely unselfish men—adding their professional knowledge without remuneration to every scheme for beautifying our cities, yet in this one respect their voice is seldom heard. Here if anywhere the public is completely out of tune with the profession, for a large proportion of the public is contributing generously and rightly to erecting the buildings.

Who is to blame and how has the *impasse* come about? Is it inevitable that these hundreds of thousands of pounds should annually turn into bricks and mortar, with a high and holy object, and nevertheless fail to constitute worthy architecture? As a Nonconformist can I be proud of seeing these countless sanctuaries of my fellow-worshippers ignored by my profession? As an architect can I be proud of all this work turned out by the profession itself? Are the religious buildings of any Church less worthy than the model cottage?

Those critics of Nonconformity who have never studied its past would probably say at random that churches with no history and no traditional ritual cannot be expected to have formed a traditional manner of building. Yet this is no rule in architecture. The design of urban flats has become an elaborate science, the electric-power station follows already accepted lines, and even the airship-shed is beginning to necessitate certain rules and formulæ, but all these were unknown in our grandfathers' day. Nor is Nonconformity without a very worthy and very stirring history, going back nearly three centuries. There were few churches of the Establishment raised in the long years which followed its separation from Rome (and its consequent adoption of buildings designed for the Roman ritual) until comparatively modern times. In this period the chapels of the Baptists, the Congregationalists and the Methodists, or the meeting-houses of the Quakers, were of the same style as the larger and more elaborate churches of London after the Great Fire. They were smaller and plainer, it is true, their builders being for the most part humble men of little wealth, but they still stand as symbolical of the simple and honest if narrow faith which they housed. I know of no more inspiring example than the little meeting-house of Jordans, near Beaconsfield, where William Penn worshipped long ago.

Then came the Gothic revival. The Church of England rushed into the old style of the Middle Ages with frantic enthusiasm, and the middle of the nineteenth century saw tracery and spires of very varying merits replacing the enfeebled Classicism which had preceded it, and which for a few years longer was regarded as constituting the more suitable style for the more lowly "chapel" of whatever size or denomination. Up to fifty years ago the Nonconformist church was almost invariably a severe and often barn-like building externally, divided internally by pews which were narrow in more senses than one. The pulpit was large and prominent, and with the gallery testified to the object of enabling a congregation to hear a preacher. Yet the gallery was never peculiar to Nonconformity, as every visitor to our City churches or to many in Germany knows, rather typical of seventeenth, and especially eighteenth century Protestant places of worship.

So far the Nonconformist chapel may be said to have had a traditional style—scanty as were the attractions of its features—and to have differed only in minor matters from contemporary orthodox churches. But we will now confine ourselves to subsequent building, when the despised "chapel" (after all a misnomer) aspired to change its form as it changed its name. It was natural that a congregation of believers should claim to constitute an individual church on the apostolic model, and perhaps inevitable that what had contented them once as a "meeting-house" should now be deemed worthy of a name more in accordance with the ecclesiastical terminology of the times. From that moment the architecture of Nonconformity seems to have floundered hopelessly and to have lost its way.

It is not that admirable examples have not been erected in certain cases here and there, it is not that lack of means is so often a hampering factor, but the regrettable fact lies in an inability to lead the way in any one direction. No earnest student of architecture could feel that poverty was an insuperable obstacle to art, for in the poorest cottages of country labourers are often found the perfection of simplicity

and of suitable materials. Some of the bare brick churches recently built in East End slums are as admirable in their austere severity and perfect proportions as equally unassuming churches of the thirteenth century. Architecture does not depend for its excellence on abundance of ornament, or indeed on ornament at all, and this is where a layman so often fails to appreciate it, for it is difficult to any man save a connoisseur to admire a barn. And this in fact (though one hesitates to put it in cold print) is where Nonconformity has so often failed. There is nothing to be ashamed of in poverty, less still in those splendid efforts of giving which have constantly raised a church in a new suburb or a wretched slum. But if you have a little less money than your neighbour you need not try and dress as though your income was double his, nor need you build a spire two feet taller than your neighbour's church when you ought not really to spend money on a spire at all. It is better that your brickwork should be good brickwork than that you should economise in that direction and spend your savings on tawdry meaningless carving and tracery. Your object should not be to attract passers-by through external decoration so much as to provide a devotional atmosphere within. You glory in the simplicity of your ritual and you should aim at simplicity in your church.

All of which a reader will say is very high falutin' and ideal, but quite a counsel of perfection. "It is not everybody who agrees with such a view, and more people would be frightened away by austerity than would be attracted by your simple worship-atmosphere theory."

Remember, however, that we have to explain the neglect of Nonconformist building by the architectural profession, and that in its mistaken ambition probably lies the first cause. The next may be in the very frequent cases where real ignorance of architecture has prevailed not only with those who have instigated the building but with the architect they have employed. There is, alas! jobbery even in religious matters, and jobbery accounts for much shoddy work alike in material and in abstract designs. A village or suburban church of the Established order has all the advantage of tradition, of central authority, and (as one can admit in spite of being a Nonconformist) as a rule the assistance of men who by birth and associations have imbibed sufficiently of architecture to select an architect with discretion. The equally worthy and equally disinterested members of a Nonconformist building committee come to a scheme as a rule with minds very innocent of experience in such matters or of tradition. When they find that an architect seems to be inevitable, they usually pitch on one who has designed a chapel in a neighbouring place, or who by dint of pious advertising has caused his name to spread so far. He is seldom a man of note, but men of note are apt to be above such things, and he is perhaps possessed of a reputation in this direction alone. The hardship alike for this committee and their professional (or fairly professional) adviser is that he has no tradition to work on in spite of fifty years of Gothic "chapel" building. He will produce at their behest a cheap, showy church characteristic of Nonconformity only because it is such an anemic travesty of English Gothic. There will hardly be a line in its design which an architect who really loves his work for its own sake can gaze at without a sense of sadness. And it is all so needless.

For there is in the writer's mind no reason why a committee should accept a bad scheme from one of their own faith when an agnostic or a Catholic can produce a far better one. All things being equal one naturally feels the call of *esprit de corps*, but it is carrying the doctrine too far when for its sake one is condemned for ever to worship in an ugly church. One of the first essentials in a church is that it should represent the best work of man and should be an offering of his best work to his Maker.

If you open your competitions, as you often do, to architects in general, you will get outsiders to compete; but you will never find the reputable men of the profession submitting plans until you come into line with all other bodies and allow him the bare justice of selecting the best plan with the help of an assessor. When all secular competitions are so arranged no architect will waste his time and money on others where the best work may be rejected by the butcher, the baker, or the candlestick-maker. Then when the brains of the profession are utilised you will find them proceeding on lines which have already been indicated in a few examples in London. The Latin cross plan will gradually disappear with all the tawdriness. You may get good Gothic or you may find other architecture more suitable; but you will find in all probability that a new arrangement will be most popular, something on the model of Dr. Horton's well-known

church at Hampstead and of others like it. This polygonal type is strange to English eyes, but it is the ideal for preaching, for singing, and for united congregational worship. No one familiar with the ancient Romanesque cathedrals of the Rhine, the magnificent Baroque churches of the seventeenth century, even with Ravenna or with our own Gothic chapter-houses, could fail to see the beauty of this form. But be the solution what it may, there will be no bridging of the gulf between Nonconformity and architecture till the former asks for the best and accepts the best, and until the latter recognises in Nonconformity as worthy an object for its attention and its genius as it has ever had. Meanwhile, as a move towards practical politics, I venture a suggestion which—revolutionary as it may seem—appears the most feasible means for the end in view: that as a subject for one of our numerous annual students' competitions in design there should be selected a Nonconformist church on logical lines. It would be possible for those responsible for the conditions of competition to so arrange it that such restrictions as cost, accommodation, and environment were those which usually prevail, and to encourage competitors to combine suitability, truthful construction, and tradition with the maximum of beauty.

OUR CONTEMPORARIES FROM OVERSEAS.

The American Architect (New York).—Recent numbers have contained illustrations of some delightfully broad work by Messrs. Willis Polk & Co. in California, plans and working drawings by Messrs. Carrere & Hastings for the approach to Manhattan Bridge, New York, and a description with illustrations of the prize-winning designs in the recent San Francisco City Hall competition.

The Architectural Record (New York) for this month has an illustrated article on "Examples of ornamental plaster work of the English Lowlands," these being from Saffron Walden, Essex. Other articles deal with the First Baptist Church, Pittsburgh, a fine work, of which Messrs. Cram, Goodhue & Ferguson are the architects; the ancient architecture of Mexico City; the Colonial architecture of Stonington, Connecticut; and a further series of Early American churches.

Arkitektur og Dekorativ Kunst (Christiania) has for its chief item a criticism and illustrations of the premiated competition designs for the new post office at Christiania.

La Construction Moderne (Paris) has published reproductions of the first three prize-winners in this year's Prix de Rome competition, and views of two of the prize-winning façades in Paris for the year 1911.

Construction (Toronto) gives illustrations of the Little Theatre, New York; Broadview Y.M.C.A. building, Toronto; some residences in British Columbia and Ontario, and a block of business premises in Toronto.

Deutsche Bauzeitung (Berlin) has published further illustrations of competition designs for a town-planning scheme at Düsseldorf; views of the elevated railway at Hamburg; and a description with views, plans and sections, of the new central fire station at Mannheim.

The Architectural Review (New York) has some beautiful views of Mr. Charles A. Platt's work, and reproduces some of the designs submitted for the Minneapolis Museum competition. An article on "Modern City Gates" shows how far in advance of ourselves the United States are in the dignity and importance of city railway stations.

Moderne Bauformen (Stuttgart) makes a feature this month of recent work of the Munich architects, Theodor Veil and Gerhard Herms, which, though fully redolent of the "neu-bau" spirit, yet preserves much of the traditional German feeling, especially in roof treatment. Theodor Hiller, of Göppingen, the architect of the village of Böhmern-Kirch in Württemberg, has several of the buildings in this village illustrated.

Berliner Architekturwelt (Berlin) has this month no particularly outstanding feature, but contains many individual examples of modern German architecture of an uniformly excellent character.

Stone (New York) is of special interest to those concerned in marble quarrying. The sufferings of reinforced concrete from electrolysis are recounted.

The Western Architect (Minneapolis) illustrates work by H. P. Berlage at Amsterdam, Laren and Leipzig; the Hastings Hotel and Apartment House, Minneapolis, and several residences in California, as well as the Women's Club at San Diego and the Masonic Temple at San Francisco.

FORTHCOMING EVENTS.

Wednesday, September 25.

Institute of Metals: Autumn Meeting at the Institution of Electrical Engineers, Victoria Embankment, W.C. (two days).

Saturday, September 28.

Northern Architectural Association: Students' Sketching Club.

Monday, September 30.

Iron and Steel Institute: Autumn meeting at Leeds (five days). Architectural Association: Day and Evening School re-opens.

Tuesday, October 1.

Royal Society of Antiquaries of Ireland: Special General Meeting at 5 p.m.; Quarterly General Meeting at 8.30 p.m. at 6 St. Stephen's Green, Dublin.

Wednesday, October 2.

Royal Society of Antiquaries: Excursion to Fore, Co. Westmeath.

ILLUMINATION IN FACTORIES.

In the annual report of the Chief Inspector of Factories and Workshops for the year 1911 is included a special report on illumination in factories by Mr. D. R. Wilson, which although it may be said to contain a certain number of truisms and platitudes, imparts nevertheless much useful knowledge.

The industries to which Mr. Wilson's attention was particularly directed were weaving and spinning mills, cloth and handkerchief factories, and composing rooms in letterpress printing works, but the chief results of his investigations are informative for a wider and more general circle, although not necessarily identical in point of detail.

For general purposes the introduction to the report is probably the more valuable. Considering first the daylight illumination, we are told that in order that this may be efficient the amount of daylight admitted should be as large as possible, the lighting should be as uniform as possible, the light should fall on the work from the right direction. These are obvious truisms, except that it is not necessarily a fact that in all cases the amount of daylight admitted should be as large as possible, unless there is some means of shading when the external illumination is particularly brilliant.

Reading on, we gather that it is not meant that the best day-lighted factory would be one of which walls and roof were all of glass, for it is suggested that if the proportion of window area relatively to the floor area is one to ten this would be adequate. Uniformity of lighting it is pointed out may be assisted not only by the even distribution of windows, but by the use of reflective surface on the walls obtained by the use of light tints with matt finish.

Mr. Wilson draws attention to a fact which, although it has long been known, has been very generally ignored in the consideration of lighting of rooms. This is that the illumination of a surface by a constant source at a given distance varies as the cosine of the angle of incidence or the angle between the vertical and the direction of light. From this it is pointed out that where side windows are used the top of the windows should reach as nearly as possible to the ceiling, a few inches difference in this respect making all the difference to the illumination in the centre of the room; also that it follows that the actual height of the room is of importance, and for rooms of equal floor area the higher is capable of far better light by side windows than any other.

Whilst daylight illumination is very much a matter of general principles, when we come to artificial lighting we find that there is far more scope for consideration of detail. The fundamental principles for artificial lighting are:—(1) The light should be adequate, having regard to the nature of the work carried on; (2) the light units should be arranged so as to cause no "glare" effects;

(3) the light units should be so arranged as to produce no troublesome shadows.

The adequacy of the light for a given industry, it is pointed out, depends upon a number of considerations, such as the nature of the work, fineness and colour of material, &c. One important point must be particularly remembered: *ceteris paribus*, the intensity of illumination should vary with the "albedo" or diffused reflecting power of the material upon which work is being done; in other words, a stronger illumination is required for dark than for light materials.

In determining therefore the amount of light which is required for working in any particular instance, care must be taken to distinguish between the illumination intensity and the surface brightness of the object looked at. Thus for example it was found by Mr. Wilson that in a linen-weaving shed the illumination intensity on brown cloth was 3.4 foot-candles, whilst the surface brightness was only 1.0 foot-candle; the meaning of this being that the brightness of the brown cloth illuminated with 3.4 foot-candles was the same as if it had been perfectly white and illuminated with an intensity of 1.0 foot-candle.

The diffused reflecting power or the degree of whiteness of the surface is termed "albedo," and is expressed as a ratio of the surface brightness of the illumination intensity, generally in terms of percentage.

Thus the "albedo" of the brown linen above referred to was 33.3 per cent.

The important subject of "glare" in artificial lighting is discussed at length, and Mr. Wilson follows Professor Weber in his definition of the means of estimating glare thus:—"A system of illumination may be described as 'glaring' when it exceeds any of the limits specified in the following, namely:—(a) If the ratio of the intrinsic brilliancy of the source of light to that of the illuminated surroundings exceeds a certain limit. The ratio should not exceed a value of about 100; (b) If the absolute intrinsic brilliancy of the source exceeds a certain value. The brilliancy of the open candle flame (about 2.5 candles per square inch) might be taken as a safe limit; (c) If the angle between the direction of vision of the eye when applied to the work it is called upon to do (e.g., when gazing at a desk, blackboard, or diagram on a wall, &c.), and the line from the eye to the source of light is too small. This minimum angle may be provisionally assumed to be about 30°; (d) When the extent (apparent area) of the illuminating body is too large. The source should not subtend an angle of more than 5° at the eye."

Glare we are told can in most instances be remedied by raising the light source sufficiently or by efficient shading between the eye and the light source. It is also pointed out that the illumination intensity of a light unit is at its maximum when the height of the unit vertically above the horizontal plane of work is 0.71 times the horizontal

distance between the given point and the point on the plane vertically under the unit.

A careful distinction must be made between glare and mirror reflection, which when work is being done on a surface more or less polished and so highly reflective, is apt to cause annoyance and inefficiency of light, the light being reflected to the eye of the worker instead of illuminating the working surface.

The question of shading and its effect on the work and efficiency of light, particularly with artificial light, is discussed, but we need not go into the discussion in detail, as it is based mainly on the application of common sense, so that although it is desirable that attention should be drawn to it in such a report there is no advance in scientific knowledge.

The question of the colour of artificial light, with its considerable range from the orange red of ordinary coal gas to the violet of the mercury vapour lamp, is only briefly touched upon. Mr. Wilson hints that the spectral composition of light and the emanation of infra-red and ultra-violet rays are of importance, but dismisses the subject with the observation that scientific opinion is still divided as to their effect on the eyesight.

The results of detailed observations in various factories are given in the report, and comparison between them is made in terms of window efficiency, according to the method first suggested by Mr. P. J. Waldram, as although Mr. Wilson considers that in this method the definition of window efficiency is not strictly accurate, the standard, although approximate and arbitrary, is of great value when rooms of different construction have to be compared.

NOTES AND COMMENTS.

ALTHOUGH we may consider that the fight in Liverpool over the podium of St. George's Hall is practically at an end, the opponents of the adopted scheme are still endeavouring to make a noise, and in the *Manchester Guardian* there has been published an interview with Professor Reilly, which, if correctly reported, does not seem to us in very good taste. He is said to have sharply criticised the "municipal bigotry" which threatens to mutilate the building, and described the endeavour which is being made to secure the veto of the Corporation proposal. "At the bottom of the whole thing," he said, "is the fact that Lord Derby is a fighter. There was a long delay in the completion of a memorial to Queen Victoria, and the Earl, who is the chairman of the King Edward Memorial Committee, is determined that this time matters shall move a little quicker. He may think the scheme decided upon a good one, but he is chiefly concerned to get on with the thing during his Lord Mayoralty of the city."

Professor Reilly is not content with abusing Lord Derby. He falls foul also of Mr. Norman Shaw, an acknowledged leader of the architectural profession before the Professor was born. "Now, Mr. Shaw is a very old man and is greatly respected," Professor Reilly said, "but we do not think he is the appropriate man to decide this question. Mr. Shaw was a pioneer in the days of the Gothic revival, but he has never quite reached the Classic style. All the younger men are now studying classical architecture with renewed interest, and much purer architecture is coming in." We do not recognise the purity of the Franco-American Neo-Grec, which the Liverpool School of Architecture, with Professor Reilly as "pioneer," is adopting in feeble imitation of the *Ecole des Beaux-Arts*, nor can we admit the claim of the youngest pioneers that their judgment in respect of Classic architecture is superior to that of Mr. Norman Shaw and Mr. Belcher. Sir Aston Webb and Professor Reginald Blomfield may differ in opinion, but it is only the cocksure young pioneer who knows all about it and abuses his opponents.

In the provisions of the Housing, Town Planning, &c., Act, 1909, the Local Government Board are empowered to make rules fixing a scale of costs to be applicable on an arbitration relative to the compulsory purchase of land, and such a scale of costs has now been fixed and published with the object of minimising, or at least keeping within reasonable dimensions, the costs in the case of arbitration under the Act. Thus it is provided that if counsel and expert witnesses are employed without the direction of the Local Government Board no costs should be allowed in respect thereof.

The modification of building by-laws for rural districts, to which we recently referred, has been utilised as part of the argument employed by the opponents for a scheme of cottage building brought before the Woking Urban District Council by a special committee appointed twelve months ago to consider the housing of the working classes problem, and no doubt this revision of the by-laws will be made a handle for postponing, if not defeating, future schemes in other localities; but the real objection in the case of Woking appears to be that the committee were too optimistic in the small allowance they made for repairs and empties.

The work of the Royal Commissioners appointed to make inventories of the ancient monuments in Great Britain and Wales is satisfactory in that it has more far-reaching results than the mere preparation of a catalogue. During their visits of inspection interest is excited, and monuments which have been overlooked or ignored are brought to light, as in the case of the Welsh Commission on their recent visit in the County of Carmarthen. Under the chairmanship of Sir John Rhys the commissioners devoted many hours to a survey of interesting places and monuments south of Carmarthen. Chief among these was the great Concentric Castle at Kidwelly, where the commissioners were received at the barbican by Mr. Dudley Drummond, of the Cawdor estate office. A thorough inspection of the magnificent ruins was made under the guidance of Colonel Morgan. Particular attention was paid to the remains of the unique chapel, and to the stone vaults tower, on the walls of which is a crude drawing in the plaster of a huntsman with hounds at heel. The vast moat and outworks were examined minutely, and various suggestions were made as to the preservation of the castle. At Kidwelly Church the figure of the Madonna and Child received special attention. At Pembrey the commissioners were interested particularly in a massive stone font which was rescued recently from base use in a neighbouring farmyard. A visit was also paid to the tomb in Pembrey churchyard of the niece of Josephine, consort of that illustrious individual—as the inscription says—Napoleon Bonaparte, who was wrecked on the Cefn Sidan sands. Returning by the coast road, the commissioners inspected the sand-buried city of Hawton St. Ishmael's, the foundations of which were recently exposed.

The text has been issued of a Bill to amend the Housing of the Working Classes Acts, 1890-1909, and the Small Dwellings Acquisition Act, 1899, and to encourage private ownership of dwelling-houses and business premises amongst the working classes, or by persons otherwise of small means. The purpose of the Bill is to relax some of the provisions of the Small Dwellings Acquisition Act, 1899, with a view to encouraging local authorities to set the Act in operation, as, although this Act was passed with a view to encouraging local authorities to assist artisans to purchase their own houses, very little use has been made of its provisions, and the amount which may be lent and the percentage of the value have now both been raised, but the benefits are still restricted to persons of the working class or otherwise of small means, as the capital value for a freehold or leasehold interest of not less than 99 years must not exceed in the case of a dwelling-house £400, in the case of a shop or business £500, and in the case

of premises consisting of a dwelling-house and shop or business premises forming contiguous buildings and occupied together £600. With the view of preventing the machinery of the Bill being exploited by speculative builders it is provided that no advance shall be made to the same person in respect of more than one house or more than one house and shop, being contiguous buildings occupied together. The Bill, when passed, may be cited as the Housing of the Working Classes Act, 1912. It is about time, we think, that there should appear upon the statute book some Acts relating to the Housing of the Middle Classes.

BEACONSFIELD, HEDGERLEY, AND BULSTRODE PARK.*

BEACONSFIELD, which means a clearing in the beeches and has no reference to a beacon, is situate in the county of Buckinghamshire, and consists mainly of one long, wide street and two shorter ones. Beaconsfield is not mentioned in the Domesday Book. It is not far from the River Thames, and was in the old coaching days a noted stopping place for the London and Oxford coaches. The church of St. Mary and All Saints is built of flint, with Bath stone dressings. It is a rich and well-proportioned Perpendicular building with a fine tower containing a clock and eight bells. The tower is the oldest part, and dates from the fifteenth century, the church itself having been restored in 1869. There are some fine brasses in the church, including

decoration. They have wide chimney-pieces of the usual Tudor type in fine freestone. In the churchyard John Hampden in 1633 exercised his trained bands on a Sunday, and for this he was summoned before the Council.

The town is chiefly famous for its connection with Waller, the great poet and politician, who lies buried in the churchyard, and Edmund Burke, the great statesman, orator and philosopher, who was buried in the church.

Edmund Waller—"maker and model of melodious verse"—was the nephew of the great Hampden, and probably by his influence was returned as Member of Parliament for Amersham before he was eighteen. His conduct in the early part of his political career appears to have been formed on his uncle's principles, for he opposed the measures of the Court with such energetic vehemence that he was chosen manager of the impeachment against Judge Crawley, whose decision on the great question of Ship Money had been in favour of the King. Within two years afterwards his opinions were so much changed that he engaged in a conspiracy, whose object was to "seize the Tower and admit the monarch's forces into the City, to surprise the Militia, and to dissolve Parliament." The despicable cowardice he displayed when the plot was discovered and his abject and garrulous confessions saved his life. After paying a fine of £10,000 Waller was released from a twelve-months' imprisonment and went to France; but the splendour of his establishment there reduced him to distress, and he obtained the permission of Cromwell to return to England. He now became acquainted with the Protector, and wrote a panegyric on his conduct; but at the period of the Restora-

BEACONSFIELD CHURCH.

one in the centre aisle to Edmund Burke, but of very recent date. There is another on the north wall, dated 1372, to Robert Lee and issue. Another dated 1609 to John Warren and his wife, Elizabeth, and four sons and two daughters. In the church are a very old chest of the time of King Charles I., and an old lock and key. In the vestry is a cabinet made out of a piece of furniture used by Edmund Burke at Gregories. Underneath the organ, but now hidden from view, is a curious incised slab to Thomas Waller and his wife (1626-27), displaying two flaming hearts conjoined. The parish register begins in 1539; the church register in 1631. Near the church is an old timbered building formerly the rectory. It is supposed to have been a sub-priory to the Abbey of Burnham. Richard Capel, Rector of Burnham, who died in 1500, bequeathed £40 for the erection of a rectory house upon the site of the ancient nunnery, to be built of timber and made a "fayre large house." The execution of the trust was begun by his successor, William Baron, afterwards Bishop of London, and completed by Richard Lawson, who followed in 1525, and the house continued to be used as a rectory till 1868. It is a timber building forming three sides of a square of two storeys and an attic. A circular staircase leads to some handsome rooms on the first floor, the timbers of which show traces of arabesque

tion employed "his imagination, his elegance, and his melody with equal alacrity" for Charles the Second. "He that has flattery," says Dr. Johnson, "ready for all whom the vicissitudes of the world happen to exalt, must be scorned as a prostituted mind, that may retain the glitter of wit, but has lost the dignity of virtue." Towards the decline of his life he purchased a small estate at Coleshill, where he was born, with the desire "to die, like the stag, where he was raised." He died, however, at Beaconsfield. His tomb is of white marble and cement, and is ornamented with a pyramid resting on four winged skulls and rising from the centre of a flat slab of white marble on which are placed four urns, one at each corner. Each side is covered with a Latin inscription, which lauds his talents as a poet without laying much stress on his political career.

But it is to Burke's tomb in the church that we naturally wend our steps. We find a simple stone under a pew in the aisle, and on the wall a marble tablet tells us that "near this place lies interred all that was mortal of the Right Honourable Edmund Burke, who died July 9, 1797." More recently a tablet with a portrait in relief has been placed near this inscription.

Beaconsfield may well hold Burke in honour. He laboured there assiduously alike as country gentleman, as statesman, and as philanthropist. There he entertained many eminent statesmen, and held out the hand of fellowship to struggling students of art and literature.

* Read at a meeting of the Upper Norwood Athenæum, by Arthur J. Pitman.

Edmund Burke was born in Dublin on January 1, 1730. At Trinity College, Dublin, which he left with the degree of Master of Arts in 1751, he was distinguished for his debating powers at meetings of the Historical Society. He proceeded to London to study for the Bar, but was, however, averse from the profession of the law, and sought means of support from general literature. The success of his Essay entitled "A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful" established him in literary life. He was appointed editor of the Annual Register. Dr. Johnson, Hume, Lord Lyttleton, Garrick, Reynolds, Warburton, Soane, and others of equal celebrity sought his acquaintance. In 1761 he entered the public service in a semi-official capacity, became private secretary to the Mar-

quis of Rockingham and it was found that James Barry had painted it, and on Burke learning that the painter was in the deepest straits of poverty he brought him to London, making him an allowance, and sending him to Paris and Rome to complete his studies. He became a member of the Royal Academy, and many of his pictures are to be seen at our national museums and galleries.

In 1768 he purchased the estate in Bucks called Gregories, about a mile from Beaconsfield. Here he lived not extravagantly, but frugally, driving four black horses and spending £2,500 a year. On July 15 he was buried in the parish church, his pallbearers being the leaders of that old Whig party which for thirty years he had animated, instructed, and at last converted to Conservatism. A little before his

BULSTRODE HOUSE.

quis of Rockingham (head of the Cabinet in 1765), and Member of Parliament for Wendover. Pitt, afterwards Earl of Chatham, extolled his eloquence, and he soon took a leading part in Parliamentary debate. He accepted office as Paymaster-General of the Forces in 1782, was made Lord Rector of Glasgow University in 1784, and in 1786 entered upon the most eventful and difficult task of his political life—the prosecution of Warren Hastings. On February 13, 1788, he commenced his celebrated speech, lasting over four days, and characterised as a "tempest of invective and eloquence." The trial lasted seven years, and terminated with another speech from Burke which lasted nine days. In 1794 Burke applied for the Chiltern Hundreds, and contemplated accepting the title of Lord Beaconsfield. But his son Richard was at the moment seized with a sudden illness and died. Burke was broken-hearted, and his career was over. "I am torn up by the roots, and lie prostrated in the earth," he said. He cared nothing more for titles and honours, and he died on July 9, 1797. Burke had great qualities, which were obscured by the want of minor qualifications. He was an unrivalled orator, but not a skilful debater; his imagination was exhaustless, but he had no play of fancy; the exercise of his powers was not tempered by discretion, his eulogy was flattery, his invective abuse. There was truth in Goldsmith's complaint that he allowed his passions to overpower his reason,

"And, born for the universe, narrowed his mind;

And to party gave up what was meant for mankind."

It is not, however, often permitted even to the wisest and most influential of patrons to be able to raise from poverty and obscurity two such men as the poet Crabbe and the painter Barry. George Crabbe, the son of a village schoolmaster and parish clerk in Norfolk, came to London in 1780, having resolved to try his chances in literature. He soon found himself in great straits, and in vain applied to Lord North, Lord Shelburne, and Thurlow. At the beginning of 1781 he wrote to Burke, who came to the struggling poet's rescue. He read his poems, persuaded a publisher to issue them, and took Crabbe to Beaconsfield, where he stayed with Burke till his reputation and position were firmly established.

In 1763 Burke happened to be at an exhibition in Dublin, where a picture entitled "The Conversion by St. Patrick of the King of Cashel" attracted universal attention. On

death he caused to be read to him Addison's paper in the *Spectator* on "The Immortality of the Soul."

"It is," says Lord Morley of Blackburn, "a touching picture to follow him from the heat and violence of the House of Commons, where tipsy squires derided the greatest genius of his time, down to the calm shades of Beaconsfield, where he would with his own hands give food to a starving beggar, or medicine to a peasant sick of the ague; where he would talk of the weather, the turnips, and the hay with the wain men and the farm bailiff; and where in the evening stillness he would pace the walk under the trees and reflect on the state of Europe and the distractions of his country."

HEDGERLEY.

The church of St. Mary the Virgin, standing on the brow of a hill, is a structure of flint and rubble in the Early Decorated style, consisting of chancel, nave, south porch, and an embattled eastern tower containing three bells. The pulpit and communion rails for nearly 200 years formed part of the parish church of Parham, in Antigua, in the West Indies, destroyed by earthquake in 1842. King Charles II. is said to have visited this church, and, noticing that the Communion Table was without a cover, took off his cloak and laid it on the table. Part of the cloak has been framed and glazed, and now hangs on the wall of the church. There is a palimpsest brass with effigy to Margaret Bulstrode dated 1540. It was formerly in the Abbey of Bury St. Edmunds as a memorial to Abbot Thomas Totyngton, 1312. In the vestry is a table of the Ten Commandments, painted on canvas, and repaired in 1722, with an illustration of a breach of each. The register dates from the year 1538.

BULSTRODE PARK.

A legendary explanation of the name states that when William the Conqueror subdued this kingdom he gave the estate of the Shobington family, who lived here, to one of his followers, and sent 1,000 men to assist him in taking possession. But the Saxon owner, calling in the aid of his neighbours, gallantly resisted the invader, entrenching himself within an earthwork in the park, which is still shown as evidence of the story, and, as his party wanted horses, mounted them upon bulls, when, sallying out of their camp, their strange equipment so confounded the Normans that many of them were slain. The King, hearing of the affair, sent for the valiant Saxon, with a promise of safe conduct

VENETIAN WELL-HEAD, BULSTRODE PARK.

to and from his Court. The Saxon paid the Conqueror a visit riding upon a bull, accompanied by his seven sons similarly mounted, and the result of the interview was that he was allowed to retain his estate. In commemoration of these events he assumed a bull's head as his crest, together with the name of Bulstrode.

Bulstrode Park is one of the most attractive and most interesting of places in the county of Buckingham. Attractive not only on account of the almost exceptional sylvan beauty and picturesqueness of the park, with its charming undulations, its beautiful beech and oak-clad slopes, and its deep and spacious valleys, which sweep through it as though they were in far off and probably pre-historic times the beds of broad and rapid streams, but also on account of its fine woodland scenery and the almost pictorially natural grouping of its forest trees. In the pleasant grounds, also, which more immediately surround the mansion, some of the most majestic specimens of the rarer trees which flourish in this country may be met with in all directions. Interesting, also, and that in a remarkable degree, on account not only of its antiquities as embodied in the antiquarian and historical records of the country, but also as illustrated in the histories of the great and well-known names with which it has from time to time been associated. It is a far cry from Caesar and his Legions to the time of King Edward the Seventh; but all those centuries have been more or less concerned in the making of the history of Bulstrode and of those who, for the last nine centuries at least, have been the successive possessors of these lands. Templars, Knights of St. John of Jerusalem, abbots and monks of early church foundations, and statesmen of the highest eminence have in their day and generation contributed to carry on the prestige of an estate which for so many centuries has formed a part of the natural history of the country.

The preceptory of Bulstrode, or House of the Knights Templars, certainly existed in 1276, for in that year Brother John the Preceptor was accused of taking a bribe of half a mark from a certain robber to let him go free. An inquisition taken in the year 1330 reported that the manor of Bulstrode had once formed part of the lands of the Templars, and after the annulling of their Order passed to the Hospitallers.

A subsequent owner was Bulstrode Whitelocke, the author of "Memorials of English Affairs," a statesman possessing great talents and considerable learning; but the flexibility of his conduct during the Civil Wars of the seventeenth century has occasioned his memory to be stigmatised with want of principle. On his death it passed to the infamous Judge Jefferies.

George Jefferies, who afterwards became Lord Chancellor, and presided in 1685 at the Bloody Assize in Somerset, built a house here in 1686. He was the man of whom Charles the Second declared that he had "no learning, no sense, no manners, and more impudence than ten carted street walkers," and of whom Burke wrote that he earned "eternal disgrace at the merciless commission which sat in judgment on the rebels of Monmouth's insurrection. The Chief Justice hanged 330 persons, and transported 800 others to the

Colonies," a punishment which in those days was worse than immediate death. On his attainder at the Revolution the place reverted to the Crown. William the Third granted it to William Bentinck, the first Earl of Portland, who did so much to pave the way for the accession of William the Third and Mary II. He greatly improved the house, and died there in 1709. Bulstrode contained for a time the celebrated Portland vase discovered near Rome in the sixteenth century, and supposed to date from about the year 200 A.D. It was deposited in the British Museum in 1810, when Bulstrode was sold to the Duke of Somerset. On the death

HEDGERLEY CHURCH.

of the Duke of Somerset in 1885 the Bulstrode Estate passed into the possession of his youngest daughter, who in 1865 married Sir John William Ramsden, Bart.

Early in the nineteenth century the notorious Dick Turpin made a raid on the Duke of Portland, who had just entered Bulstrode from the public road, and was driving up to the mansion when his escort was driven off by the brigands, and the Duke himself was robbed of his watch and accessories.

On one side of the mansion stands the old ivy-clad square battlemented tower and its archway, commonly known as the

Pigeon Tower, being inhabited by a colony of doves. At the end of an avenue of lime trees is a column, upon which stands a solid leaden vase of heraldic design, bearing the words:—

"If by each rose we see
A thorn there grows,
Strive that no thorn shall be
Without its rose."

In another part of the grounds stands the very beautiful Venetian well head of early date, on the sides of which are two finely-sculptured shields, with armorial bearings upon them; and on its base may be noticed the circular water cups, cut out of the stone, for the birds to drink from, as was the custom in Venice. This beautiful well head came from the Palazzo Moro built on the site of the traditional residence of the presumed original of Shakespeare's "Othello."

The chief feature about the camp is its size, which is unusually large for Berks. The entrenchments are double on the north-east side, treble at one or two parts, and enclose an area of twenty-one acres. The breaks on the north-west and south-east sides are probably larger now than they originally were, owing to damage or subsequent modification of the earthen banks. The large oak trees growing on the ramparts are a blemish.

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

IV.—FACADES.—DOORWAYS.—CAMPANILI.—DOMES.

(Continued from last week.)

AN entirely different façade, and one which is the fittest in Italy to rival those of the northern cathedrals, is that of San Lorenzo at Genoa. It is mainly remarkable for the exquisite, indeed unrivalled, beauty of its three western doorways.

There is nothing more beautiful nor more thoroughly Gothic in the whole realm of Christian art than these three great portals of Genoa Cathedral, whose natural polychromatic construction has been descanted upon. They cannot be said to vie with, because they are in many respects unlike, the general type of the great French doorways. Yet in some particulars they are so puzzlingly like a certain class of French work as to afford room for endless conjecture, and there is perhaps no point on which trustworthy documentary evidence would be more interesting than any bearing on their construction would be. The north and south-west doorways of Rouen Cathedral have many features which suggest a connection with these Genoese ones, though the French portals must be at least a century earlier.

The detail of the sculpture of foliage is very similar, in both rather Italian than French in its character, whilst the rich effect obtained at Genoa by inlaying black marble with white, and white marble with black patterns, finds its counterpart at Rouen in an ingenious sinking of the face of the stone with deeply-cut indentations, which at a little distance produce by their deep shadows almost the same effect as that attained by the marbles of Genoa.

Another remarkable feature in this façade of Genoa Cathedral is that, unlike any other Central Italian example, it was apparently intended to have been finished with two steeples. This fact, added to the mixed French and Italian character of the sculpture, and to the distinctly French treatment of the mouldings, which are arranged and undercut in a way rarely, if ever, seen in Italian work, tend to the belief that this is not to be claimed as pure Italian. Either it was executed by a Frenchman or by an Italian who was well acquainted with the architecture of the north of France.

Be this as it may, we have here the harmonious combination of ideas derived from different sources, and entirely consistent with the precise object, position, or locality of the building in which they are applied, while avoiding the remotest semblance of mere copyism of other men's work.

The date of this façade of Genoa Cathedral may be fixed as towards the close of the thirteenth century, nearly a hundred years later than the side western doorways of Rouen Cathedral above alluded to. It is divided into three portions by two pilasters corresponding in position with the arcades of

the nave. Each division has a grand doorway, the centre one being recessed in four orders, with every rich sort of ornament about it.

In the tympanum is sculptured The Majesty, surrounded by the symbols of the Evangelists, and immediately below, within an oblong panel, is the martyrdom of St. Laurence, in which devils are seen stirring the fire under the gridiron upon which the body of the saint is extended.

Some of the smaller shafts are completely covered with carved work representing eagles in medallions and foliage in ovals, while in the jambs of the doorways themselves foliage and minute groups of figures are sculptured with a delicacy and beauty that defies description. Among these groups may be discerned the Tree of Jesse, terminating at the top with the Crucifixion and scenes from the life of the Blessed Virgin, commencing at the bottom of the jamb with the Annunciation, and going on through the Visitation, Nativity of Our Lord, Epiphany, Presentation in the Temple, and Massacre of the Innocents, to the Flight into Egypt.

The façade terminates in the centre in a gable, beneath which is the chevron-moulding and corbel-table, which is universal in this position, and it was originally intended to be flanked by two towers. Of these the southern one has alone been completed, but in a very late style, and with an octagonal cupola. The usual disposition of alternate bands of black and white marble obtains here, as in other Genoese façades, from the ground to the gable, but so broken by the carvings of the doors, the numerous small windows, and the inequalities of surface, as to be by no means unpleasing.

Within the recesses of the portals the plane surfaces have all a pattern on them in coloured mosaic—a novel decorative feature, still beautiful, though the rich glow of colour is somewhat dimmed by the falling out of the tesserae here and there.

It is curious and instructive to observe, in considering the lower part of this glorious façade of San Lorenzo at Genoa, how the Italians clung to Classical forms in their buildings, even when the Romanesque had long passed away. The plinth is decorated with arabesques in low-relief containing heads of animals and men, in the style of a Roman sarcophagus. Immediately below the bases of the shafts is a row of acanthus leaves. The abacus is thoroughly Classical, almost Renaissance, in feeling, and the same thing may be seen in two of the finest examples of Italian Pointed—Giotto's campanile at Florence and the façade of Siena Cathedral.

The ingrained Italian practice inherited from the ancient Romans of making the exterior ornamentation a mask to the structure is particularly observable in the elaborate façades added to their cathedrals in the Gothic style, which do not even follow the outline of the roofs hidden behind them.

The existence of such a feature at all is wholly inconsistent with the spirit of mediæval architecture; one might say of architectural art altogether.

In the elevations of the cathedrals at Orvieto and Siena, as seen in photographs or engravings, that is, without the rich play of colour which is one of their charms, we have most inconsistent and illogical designs. The nave and aisles are each finished with a gable, which are of lofty pitch in themselves, but are set upon low façades, which, in comparison with those of the northern cathedrals, seem to have had a whole storey taken out of them. A strong horizontal line below the springing of each seems to cut them off from the substructure. Between them and the angles of the façade are groups of pinnacles, which, as if to show their utter uselessness, are not carried down as buttresses to the ground, but spring from the impost line of the doorways as merely ornamental features; and the great rose window is set in a square panel, as if to intensify its separateness and want of connection with any other portion of the fabric.

Although such buildings as the cathedrals of Orvieto and Siena have a clerestory with lean-to roofs to the aisles, no intimation of the real construction is derived from the façade, which is merely put up for the sake of effect; and, however beautiful it may be in natural colouring, sculpture and mosaic, must be looked upon from an architectural standpoint as untruthful. In the examples above quoted we find very steep-pitched gables in front of almost flat roofs, and when seen from the rear produce an effect by no means satisfactory.

Occasionally we find very low-pitched gables terminating a nearly square façade cut into three divisions by pilaster-like buttresses carrying insignificant pinnacles, whose long untapering forms are not connected by a single string-course,

and doorways, niches and windows all planted at random, except that a certain symmetry is maintained in their disposition, which does not assist in rendering it more mediæval in appearance.

The central western doorway of Orvieto Cathedral is a fine example of that rich and almost jewelled type of work characteristic of Italy, of which the campanile of Florence is the most famous example. The richness of the door-jambs with its alternating orders of spiral shafts, carving and inlay, is remarkable. On the other hand, the weaker qualities of Italian Gothic come out in such details as their secondary impostes, through which the archivolt mouldings appear to run, a detail the origin or significance of which it is difficult to understand, and which weakens the whole composition considerably. But it is, nevertheless, a sumptuous piece of decorative work carried out without stint as to cost or labour.

Another peculiar feature of the three western portals of Orvieto Cathedral is the manner in which the space above the much lower side ones and their Pointed arches is filled with windows whose simple unfoliated tracery ramifies from tall thin mullions. Translucent alabaster in lieu of glass fills these windows as well as those along the sides of the nave, the latter to about half their height.

The richly moulded arch of the central portal is semi-circular—an instance, though only one among many, of its retention by the Italians in the latter part of the thirteenth century. The tympanum here is occupied by a lovely sculptured group of two angels holding a canopy over a seated figure of the Madonna and Child, ascribed to Andrea Pisano and Maitani; while on the wall spaces between and on either side of the three doors are those celebrated reliefs, those complicated compositions with numerous figures on a small scale, as to whose origin critics have held various opinions.

(To be continued.)

MICRO-FUNGI THAT RUIN BUILDINGS.

DESCRIPTIONS have appeared in the journals representing the various trades of specific fungi (i.e. moulds and mildews) that so seriously affect pulp and paper, fibres and cloth, food, leather, &c., as to destroy a large part of their value. The present paper deals with the various kinds responsible for the breakdown of many portions of buildings. They are all powerful, though small, enemies to man's work, and by their insidious operations manage to circumvent his intentions.

St. Paul's Cathedral and many other important edifices have given anxiety to the authorities because of subsidences and cracks appearing in definite parts. Although reasons are assigned for such defects, it is possible that the original causes for their development can be attributed to the secretive actions of microscopic, or at any rate, dwarf fungi. At intervals they disintegrate particles in the structure, and by weakening the foundations, walls, and ceilings allow initially undiscernible collapses, which by repetition become obvious and dangerous. We all know how terrible dry rot has proved itself to be. In the same way there can be no doubt that the lesser-studied fungi also deserve deprecation in this direction.

We illustrate herewith a few of the more prominent specimens of this pernicious group. These are found on the soil, in mortar and cement between bricks and stones, on ceilings, and on interior walls. They sometimes become exceptionally abundant round sinks, disfiguring the plaster, and are no doubt frequently dispersed therefrom throughout an establishment.

It does not follow that a building must necessarily have been attacked by them for a period as long as the age of such erections. An old house that has so far faced such dangers safely may become contaminated several years after it has been built, and then succumb little by little to the ravages of minute fungi.

On the other hand, a wholly new building may become a victim simply because the fungi happen to be present. Both new and old structures correspond with young and aged people in this respect, in so far that each class is more liable than "middle-aged" representatives to become affected.

The varieties depicted in fig. 1 never exceed $\frac{1}{4}$ inch in diameter, though they have several relations to be found in woods, on fences, &c., which are much larger than and different from them in several ways. We may find on damp walls scattered spots of the size mentioned, ranging in colour through a series including buff-white, yellow, honey-

hued, and reddish. They begin as very small rounded elevations, which subsequently swell up to hemispherical shapes.

No. 1.—Magnified shot fungus; actual size only like pin's heads in diameter. The spore ball is suddenly ejected as shown.

Meantime they become crudely fringed at their bases. The name of this fungus is *Sphærobohus terrestris*.

Its most remarkable feature is that it discharges a spore-ball after the manner of a cannon or mortar. At first the whole object is solid. Then the contents so modify themselves as to become a hollow case with a loose lining, united only by its top edge to the case. The lining encloses the spore ball. When ripe, a fungus of this kind suddenly turns its lining inside out, thereby forcibly ejecting the spore-ball, which is often carried to comparatively enormous distances. The spore-balls contain invisible conidia, or reproductive spores, which are released when the spore-ball comes into contact with a suitable environment. The conidia (spores) are set in fours on top of minute bladders, which are grouped together inside the ball. In fig. 2 the details

No. 2.—Tremendously magnified spores of the shot fungus.

are somewhat diagrammatic, as we can never magnify them so hugely as there shown.

In fig. 3 are depicted specimens of *Lachnea scutellata*. They range in size from $1\frac{1}{2}$ to 4 millimetres in diameter, and

No. 3.—Top views (magnified) of the hedgehog disc fungus, which is only $1\frac{1}{2}$ —4 millimetres across when ripe.

begin as small knobs, which expand and open out as flat discs with densely hairy fringes. In colour they may be bright red, but when growing inside buildings they are

generally dull reddish or brownish. The surface layers of the disc are composed of a mass of tiny transparent sacs or cases (called *asci*), in each of which are eight spores, visible through the enclosing membrane or skin. These are set upright side by side in a compact collection, and are released by the shrivelling and decay of the fungus. In fig. 4 is

No. 4.—Side views of the hedgehog disc fungus, magnified. The actual diameter of the mature fungus is only about 4 millimetres.

given a view of some of these sacs and the hairs of the fringe belonging to another species; but their arrangement will give an idea of what has been described.

Another somewhat similar, yet distinctive, specimen is shown in fig. 5. It is proportionally longer than that previously mentioned, and has a shorter fringe of hairs. Moreover, as it is snow-white, it is rather difficult to discern on

No. 5.—Showing how the bristle-funnel fungus develops. See No. 6 for internal details. Magnified: actual size, $\frac{3}{4}$ millimetre in diameter.

plaster, mortar, and cement. Its mature size is merely two-thirds of a millimetre, so that it is likely to escape attention in situations where it exists in thousands. It is named *Dasyscypha ciliaris*. Like the second one referred to, its disc is occupied by a group of clear-walled *asci* (sacs), each containing eight spores. In between these hairs are to be found shorter ones than those constituting the main part of the fringe, the latter of which usually bear at their summits minute yet perfectly symmetrical crystals of lime oxalate. Some idea of the reproductive arrangement is given in fig. 6.

No. 6.—Enormously magnified section of the bristle-funnel fungus; showing the transparent sacs containing eight spores apiece, and also the oxalate of lime crystal laden hairs.

It should be remembered that these visible objects are the fruits of the fungi. That is to say, they correspond with apples, oranges, pea-pods, and so on, in so far that they are the means by which the fungus in each instance reproduced and distributed. The damage is, however, due more

directly to the vegetative portions, which will now be briefly described.

When the spores are released they elongate into hollow or tubular threads, which branch and interlace with one another. These matings, or *mycelia* (as they are called) grow within the substance, instead of simply on its surface. It is true that in some cases the threads run along or get erected into tufts above the substance, but these filaments are generally spore-carrying or germinative.

It is because of the ramifications of the *hyphae*, or filaments, that the foundations, ceilings, or walls are slowly disintegrated. The filaments, by extracting nutriment for their own sustenance from their surroundings, exhaust the latter of some ingredients, and, therefore, hasten irregular decomposition, with the result that weakness is set up, and this is hastened as a matter of simple mechanical rearrangement of the parts. Fractures several feet long may be traced to the doings of a number of minute fungi of the kind illustrated.

Of course, when once the fungi have obtained a good start their reproduction increases at a rapid rate, and the danger is intensified.

As to the different ways in which spores get distributed, these are so numerous that only a brief outline can be given of them. The wind, rain, water currents, clothing, boots, animals, roof leakages, gutters, implements—these comprise a few of the means by which the invisible spores are conveyed. Granting that a few of the spores settle upon a moist spot, or in an accidentally inflicted crevice, they will not be long before they exert their evil sway.

Although in some forms lime is deleterious to fungi, it is, as a rule, a very excellent food for a large number of specimens. Acids generated by the operations of the fungi combine with the lime to make various calcic salts, and these, by decomposing, cause other modifications which materially affect the structures holding them.

We hear much concerning the effect of bacteria or germs, yet the actions of the latter are, in the majority of cases, secondary or supplementary to the misdeeds of the fungi. The bacteria are, however, better adapted to germination and observation in test tubes; hence their attraction for so many scientists.

So far as the writer is aware, these obnoxious, though curious, fungi have been ignored as belonging only to old and wretched buildings or to utterly neglected ones; yet it will almost certainly be found that many new erections become contaminated prematurely by their presence.

Agricultural science has enabled plant cultivators to save thousands upon thousands of pounds, as a result of making a systematic study of injurious fungi and applying the knowledge in a practical direction. There is no reason why building substances, stones, and so on should not be antiseptically treated, just as are fruit and timber trees, which are repeatedly sprayed, so that they may be cleansed of fungi and so rendered immune to successive onslaughts of the enemy.

It is difficult to see why something should not be done on the same lines on behalf of architecture. At any rate, to know the appearance and habits of an enemy is to ensure better safeguards to property.

UNIVERSITY INTELLIGENCE.

In connection with the opening of the session at University College, London, the Provost, the Deans, and Vice-Deans of the Faculties of Arts, Laws, Science and Engineering will attend from 10 A.M. to 1 P.M. on Monday, September 30, and Tuesday, October 1, for the purpose of giving advice and information to students entering the college.

Among the public lectures that have been arranged is one by Mr. W. H. Ward, M.A., F.R.I.B.A., on "The French Renaissance in Architecture," to be delivered on Thursday, October 10, at 6 P.M., when Mr. Spencer W. Morris, Master of the Worshipful Company of Carpenters, will preside.

ILLUSTRATIONS.

1 GREEK STREET, SOHO.

AMONGST the many little-known interiors which abound in London houses is the subject of our illustrations, which we present for their intrinsic value as examples of detail.

SEDILIA, ST. ANDREW, HECKINGTON.

THE drawings by "Avec beaucoup de Peur," which we reproduce, were awarded a prize in the monthly competitions of *The Architect Students' Sketching and Measuring Club*. Some short notes on the church are included on the drawings.

INTERIOR DECORATION.—III.

By ALBERT E. BULLOCK, A.R.I.B.A.

GREAT BRITAIN.—II.

(Continued from last week.)

A HOUSE until recently existing in Love Lane, Billingsgate, and facing a square courtyard on the principal side, is said to have been inhabited by Wren. Most of the panelling and ceilings capable of being removed have been incorporated in the new school building of Sir John Cass' foundation.

A ceiling from one of the ground floor rooms is shown in the accompanying photograph, which was taken subsequent to the removal of the cornice. The whole house was in one style, of about late William III. period.

There are several other very interesting ceilings extant, dating from about this time, which are worthy of mention. The first is that contained in the church of King Charles the Martyr, at Tunbridge Wells, within the parish of Tonbridge, and is said to have been the first church built within that town, being formerly known as the "Old Chapel." It

whitened over for the convenience of the commercial use to which the room is now relegated. The frieze contains numerous shields bearing the arms of royalty and many celebrated west country families, painted by Stannaway.

The ceilings of Holyrood Palace are of exceptional character, especially those to the morning-room and the main staircase.

John Mylne, the master-mason, had prepared a plan for altering the Palace in 1663, which was carried out by his nephew, Robert Mylne, in 1671. The latter was associated with Sir William Bruce in the decorative works, and the names of many assistants are preserved in the Scottish records, notably the two English plasterers, John Halbert and George Dunserfield, who were the authors of the ceilings referred to, which they modelled between 1674-9. Unicorns in very full relief figure in the scheme of the morning-room ceiling, and large female figures occupy the angles of the staircase ceiling. The timber for wainscoting was imported from Rotterdam, two Dutchmen being engaged on the work of painting and carving. Jacob de Wett was employed to represent in colour many ancient worthies, and as a side issue expended his skill in faking marbling to

CEILING FROM AN OLD HOUSE IN LOVE LANE.

was opened in 1684; the ceiling is formed by means of a series of panels with circular mouldings, some of which are coved in a semi-spherical form, the mouldings being enriched with modelled ornament, fruit, and flowers, and having four cherubs' heads applied to the spandril-shaped panels formed by the intersection of the circular ribs. The ceiling does not centre with the present chancel, probably owing to a subsequent widening of the nave and a corresponding alteration in the position of the chancel to balance the galleries. The most recent alterations were carried out under the directions of the late Mr. Ewan Christian.

The Custom House, Exeter, had a good Charles II. ceiling in the Long Room on the first floor, erected in 1681, now however, allowed to go to decay. That city contains a better example of rather later date in the room known as the "Apollo Room" in the Old Merchants' Hall, now used as a millinery showroom.

This ceiling was added in 1695, subsequent to the visit there of Cosmo, Duke of Tuscany, in 1669. The oak panelling to the walls is very boldly moulded, but, unfortunately, lime-

chimneypieces, for which work he received an increased allowance, while Jan Vansantvoort carved much of the woodwork in the principal State rooms.

The chapel of Farnham Castle, Surrey, contains some good Charles II. work in the wood carving of the wainscoting, overdoors, &c., with a plentiful supply of angelic heads. The work was carried out between 1662 and 1684 for George Morley, Bishop of Winchester, who probably employed John Webb on the earlier portion, judging from the material used and the general characteristics of the work. Some of the modelled work to panelling is in composition as adopted at Wilton; there is also some good carving on oak over the door and to the chimneypiece in the hall, with some pine or limewood carving on oak panels and styles in the chapel.

Badminton House, Gloucestershire, was practically rebuilt by Lord Herbert, Duke of Beaufort, in 1682. His ancestor, Henry Beaufort, Duke of Somerset, was the great grandson of John of Gaunt.

The Oak room is a Jacobean work transferred from Troy

House, where it had in turn been adapted from the remains of Raglan Castle, Monmouthshire. The carved chimney-piece is an exceedingly elaborate, rather laboured, example of the period, but withal a fine piece of work. The dining-room is a grand saloon, with lofty fluted composite columns supporting a modillioned and consoled entablature. The overmantel is carved in the Grinling Gibbons' manner, as is also the overdoor and sundry panels, which are carved with representations of dead game, fruit, and flowers in a finish which indicates the hand of a master carver.

equally refined chimneypiece at Rushton Hall. The caduceus, the French emblem of commerce, decorates the hobs of the drawing-room grate, and was a favourite feature with nineteenth-century architects, as Sir Robert Taylor and Sir John Soane.

Like most mansions which have received alterations in succeeding generations, Badminton House possesses a Chinese room, a style which appeals very little to modern taste, the trellis pattern work being more suitable to garden architecture.

FIREPLACE AND OVERMANTEL, FROM CLIFFORD'S INN, LONDON.

William Kent made considerable additions to the house in 1740, and designed Worcester Lodge, where a ceiling of his exists. A chimneypiece by him, formerly in the lodge, is now fixed in the east room; it contains his usual consoles, with the triple husks, which have been referred to earlier as indicating a means of identifying the author.

The hall is a stately room finished in white with amorini crowning the pediments of the doors from the chisel of Rysbrack.

The large drawing-room contains an exceptionally delicately carved chimneypiece of the English Empire style of the time of Flaxman, who was probably the sculptor of the

The Hall and Governors' room of Chelsea Hospital occupied the attention of Sir Christopher Wren for some ten years from 1682. The chapel is formed with a barrel vaulted ceiling with enriched panel mouldings and long carved panels at the springing to each bay. The semi-circular headed windows below are flanked by an order with a cartouche affixed to the spandrels of a character similar to those adopted later by James Gibbs in a similar position in the Radcliffe Library, Oxford.

The wainscoting is of late Charles II. design, with fielded panels, leaf-carved capping and cherub heads to the pilasters. The whole forms a simple yet decorative scheme.

PANELLING REMOVED FROM CLIFFORD'S INN, LONDON.

No. 3 Clifford's Inn, formerly the residence of John Penhallow, affords a particularly pleasing example of the period of James II. The room illustrated in the accompanying photographs is now in the woodwork section of the Victoria and Albert Museum, South Kensington. The carving gains considerably in effect from being limited in its application to distinct portions of the room, as the door-heads, architraves and fireplace. The details give a good idea of the nature of the carving, which is mostly executed in cedar and applied, the panelling generally being in oak. The Penhallow arms, quartering Penwarin, are carved on the shield over the mantel; the marble architrave is later. The size of the room is 18 feet long by 14 feet 10 inches wide and 9 feet 10 inches high.

The panels are raised from the styles in the manner usually adopted at this time, with bolection mouldings acting in the reverse way to the panelling of the beginning of the century. The composition of the carving to the overmantel consists of an interlaced design of flowers, fruit and leaves,

and below the mantel board at the extreme angles will be noticed two small amorini. The main cornice and the architrave to the fireplace are both carved with the acanthus-leaf ornament of the Corinthian capital origin on an ogee moulding. The angel corbel in the door-head and the linen festoon in the panel of the fireplace architrave are features of note. The room dates from 1686-8.

(To be continued.)

TINTERN ABBEY.

THE following works relative to the preservation of the structure have been undertaken during the year 1911-12 by the Commissioners of Woods and Forests, as stated in their annual report:—

West Front.—The scaffolds erected in 1911 for the examination only of the great west window and the west front generally, in order that a report and estimate of the repairs necessary might be prepared, were subsequently strengthened and added to, and the whole front has been cleared of ivy and other growths which were damaging the structure; the stonework of the gable and walling generally has been secured and the gable protected and pointed with cement; the stonework of the large window was found to be in a very dilapidated condition, some of the mullions much bent and out of perpendicular, cracked and shaled, and burst with the iron bars fixed therein, parts of the tracery had fallen out, and a great deal of the moulded and curved work was split vertically, being in many instances "face bedded," and large pieces of the heavily moulded stonework have fallen away.

Saddle bars of copper, instead of iron, have been introduced between the mullions in suitable positions to steady them; the tracery has been secured, where necessary, with copper clips and bands, all points where water could lodge have been carefully filled in, and the whole has been grouted and pointed. The south-west buttress has been reset to a sufficient height to meet and strengthen the broken and dangerous part of the south side of the gable; the north-west buttress has still to be pointed.

Clerestory, South Side of Nave.—The whole of this clerestory is in a bad state, but those parts above the two western bays of the nave appeared to be the worst. A scaffold has been erected, and on examination the work proves to be in a dangerous condition—a serious settlement has at some time taken place, and there is a large crack up through one of the arches and to the window and work above, the sill and head of the clerestory window being completely dislocated, and of the wall above part leans to the north and part to the south, and being 1 ft. 10 in. out of upright in the total height.

To secure this without undue risk it will be necessary to erect very strong shores and centres to prevent movement in either direction.

A scheme has been prepared for this, and the work will be started directly the season is sufficiently far advanced to allow of it.

Infirmary, &c.—Some further repairs, protection and pointing have been done to the walls, also to those of buildings on the west front and other parts of the Abbey.

The number of visitors in the year to December 31, 1911, was 17,957, as compared with 17,542 in the previous year.

SOME NOTABLE BRITISH TESTS REGARDING THE STRENGTH OF REINFORCED CONCRETE.*

THE journal *Concrete and Constructional Engineering* has at my request collected particulars regarding a number of tests carried out in Great Britain as to reinforced concrete. These particulars were summarised under my supervision and published from time to time as a series of articles. I endeavoured to have this collection made exhaustive, but there were, naturally, a few experiments of which particulars could not be obtained, owing to their having been conducted by private persons who do not seem inclined to divulge the information. The data were on that occasion presented with little comment, it being thought desirable to place the facts on record in a simple way, so that the reader could draw his own conclusions if he so desired, but as a recapitulation of the results obtained is impossible in a short report such as this one, I think a useful purpose will be served by here indicating the more notable tests and the lessons I hold they taught, so that the members of the International Testing

* Some notes by Edwin O. Sachs, F.R.S. Ed., London, presented at the New York International Congress on the Testing of Materials.

Association may obtain some idea of the nature of the work done in the British Isles.

That very little has been done in this country in the way of research work regarding reinforced concrete is, of course, well known. We cannot aspire to having any leading position in this direction, except in respect to the question of fire resistance, which does not quite come within the scope of this report. What little has been done is due to private enterprise alone, and there has been no effort to guide these private workers, so that their efforts could be properly collated, compared and eventually form part of some general scheme of investigation. The private individuals and firms, however, who have undertaken tests deserve commendation, for they have performed a service to the community, and particularly to the engineering and architectural professions, which we had no right to expect. Our public institutions, who should have assisted in experimental work, have, unfortunately, been very remiss, for there is practically nothing to place beside the elaborate and highly commendable researches carried out by engineering professors in public laboratories in the United States, Germany and France. Even our Colonies have done something in this direction, though the Mother Country has omitted to do anything. The only exception, as indicated above, that stands to our credit are the official tests carried out upon the fire-resistance of special systems of reinforced concrete construction conducted by the British Fire Prevention Committee. These tests are especially noteworthy, as very little has been done elsewhere in this direction, the United States being practically the only other country that has carried out any systematic series of such experiments. It is to be hoped that the results of modern investigation in this direction may also some day be recorded for the benefit of the Association.

Firstly, I would remind the members of the Association of some early tests carried out in England from 1870 to 1876 by Mr. D. Kirkaldy and Mr. Thaddeus Hyatt. They demonstrated the value of anchoring the ends of bars in flat slabs because it was evident that the adhesion failed in certain cases. They also proved the value of fixed stirrups or vertical members in concrete beams, though, due to the load being applied centrally, the value of these vertical members was more in the direction of a mechanical anchorage to the main tension member than in resisting diagonal tension.

The next experiment, namely, one by Mr. Frederick George Edwards, carried out by Mr. D. Kirkaldy in 1891, also showed the advantage of anchorage to the ends of bars, and that the smaller the reinforcement the less need was there for the anchorage, because the perimeter of the smaller bars as compared with larger bars was greater.

In 1893 or 1894 another experiment was carried out for Mr. Edwards, which showed that beams could be satisfactorily constructed with diagonal members with holes through the webs.

The tests by Stuart's Granolithic Company in 1893 and 1894 showed some remarkable results with flat slabs heavily reinforced, and can only be explained on the assumption that the stress strain curb on the concrete was more than a parabola, being almost rectangular.

The tests by Sir John Fowler and Sir Benjamin Baker in 1896 on slabs reinforced with expanded metal also showed remarkable resistance, but insufficient data regarding the strength of the concrete precludes us from drawing any special conclusions therefrom; the same remark applies to the tests by Mr. James Mansergh in 1898, and by the Northern Architectural Association and others in 1899 on slabs also reinforced with expanded metal. The test by Mr. A. T. Walmisley, Mr. J. P. Allen and Mr. A. H. Morton in 1903 was on a large span flat slab, but nothing much can be gained from it except that the ordinary methods of calculation are satisfactory.

Other tests which we published might be examined in detail to show the application of the formulæ in practice, and the factor of safety obtained from the ordinary assumptions, but they contained no special lessons.

Messrs. Hodkin and Jones in 1905 proved how the resistance of a concrete floor was materially increased by the insertion of corrugated bars of some depth extending well up into the floor, and at the same time it was shown how the resistance of ordinary rolled steel joists was increased by the concrete surrounding them in a floor of the old-fashioned type.

The tests on the Herbst tubular floor constructed by the Armoured Tubular Flooring Co., Ltd., and conducted by the British Fire Prevention Committee in 1907, showed that there was ample resistance, when carefully constructed, in such floors of moulded ribs and moulded filling pieces which serve as permanent centres for a topping of concrete, such floors

being in reality of T-beam construction with a suspended level ceiling.

The test by Messrs. D. Kirkaldy & Son in 1907 on a column reinforced only with Kahn bars showed that the inclined ribs of the Kahn bar bent inwards to the centre of the column afforded considerable increase of resistance. The test by the same firm of some arched roof trusses at Hammer-smith Baths reinforced with Kahn bars, though it is difficult to draw any detailed conclusions therefrom, proves the strength of such a structure in reinforced concrete.

Some tests on the Kleine hollow brick and concrete floor with flat bar reinforcements embedded in mortar in the joints between the bricks proved that concrete below the neutral axis in an ordinary floor is in large part ineffective, and showed that a floor of that type becomes practically a series of T-beams, and that the mortar seemed to adhere strongly to the bricks, and the webs of the T-beam construction are consequently stout enough to resist the shear or diagonal tension stresses.

The tests by Mr. Blackadder substantiated the adequacy of the ordinary method of calculating rectangular beams in reinforced concrete; those built with shear rods, however, do not show very remarkable results, possibly because of the form of the shear members which were inclined but not rigidly attached to the main bar and possibly because of the manner of loading and of the form of the test pieces.

The tests conducted by Messrs. D. Kirkaldy & Son in 1902 for Messrs. A. E. Williams are interesting as being in respect to doubly reinforced rectangular beams.

The tests on columns for H.M. Office of Works, which were also conducted by Messrs. D. Kirkaldy & Son, show that the ordinary formulæ fit the conditions of practice well. It was an interesting fact the columns broke near one end, and an explanation of this is needed.

The test on hooped columns which was carried out some years ago for Mr. William Dunn agreed generally with the results obtained by Professor Talbot, considerable deformation resulting before the hooping apparently came into play, and this was recently criticised as resulting in the concrete being overstressed in the early stages and the column deformed before the hooping proved effective, which it eventually did, in increasing the ultimate resistance of the column. The inference drawn was that the strength of the column which could be worked upon in practice was merely that of plain concrete, and though correct for a column so made was not applicable to columns in which a spiral binding was used together with a fair amount of vertical rods, which combination has been shown by other tests not to have considerable deformation in the early stages of loading, this meaning that the concrete was not overstressed, and such columns have greater resistance than plain concrete.

Various other minor tests went to show, in a general way, the uniformity and general reliability of reinforced concrete, even if they do not add much to our knowledge of theory, or if they cannot be considered as sufficiently detailed to be of scientific value.

The amount of research work which has been done in this country is, however, as indicated above, very small, and it is to be greatly regretted that England, who was the mother of several of the earliest inventors, and in particular of Mr. W. B. Wilkinson, who should be called the real inventor of reinforced concrete as a method of building construction, should be so behind other countries in the investigation of the subject.

It is probably the unscientific manner in which we went about the investigation of reinforced concrete that led to it being undeveloped here and first exploited abroad, and finally returning to us when it was regarded as a foreign system. This is too often the tale of invention in England, and our engineering institutions and our professors of engineering have nothing to compliment themselves upon. At the present time we are, in fact—except in respect to the matter of fire resistance—very much behind all the other great nations in our tests on structural materials and systems of construction, which are few and far between, and are only executed on a small scale.

It seems almost hopeless to expect our Government or our engineering colleges—where so often lack of interest or understanding of such problems has been shown—to now pay any attention to the matter, so that we can only hope for the efforts of private bodies, such as the professional societies intimately concerned.

Should this slight contribution to the subject by its poverty compared with the contributions from other countries assist in an awakening of my colleagues at home as to the necessity of systematic research work, then these lines will not have been written in vain.

THE ARCHITECTURE OF LONDON HIGHWAYS.

By VIATOR.

IN THE HEART OF THE OLD CITY.

It was somewhat difficult to find the fitting sub-title to this article; but the above selection will perhaps best serve the purpose, though consideration will be for the most part confined to those two important thoroughfares lying respectively between the Mansion House and Blackfriars Bridge and between King William Street and Ludgate Circus.

And these two thoroughfares have very different histories; for, whereas Ludgate Hill, St. Paul's Churchyard and Cannon Street are old—almost classic ground in the story of London—Queen Victoria Street is of the nineteenth century, having been driven through a number of small streets in the ill-considered fashion of the town-misplanners of mid-Victorian days.

Consequently, we should not expect to find any old buildings in this latter thoroughfare, and as a fact their number is very limited.

But is the modern work much to boast of in this street? It must be confessed that the breadth of the street gives a feeling of satisfaction, though even this would probably not appeal to those acquainted with other European capitals. But here the broad satisfaction ends; for, though various individual blocks of building are commendable, the *tout-ensemble* is disappointing, and the sky-line effects are in general unsatisfactory, and at times even offensive, and these adjectives are appropriate also to many of the buildings.

And Queen Victoria Street lacks restfulness in appearance, due to the inartistic cleavage referred to just above; many of the side streets running off at highly acute angles, necessitating, but seldom obtaining, well-considered corner treatment of the buildings.

In according detailed examination along this thoroughfare, the kaleidoscopic change from modern Gothic to modern Renaissance, and from modern Renaissance to modern Gothic proclaims in no uncertain note the date of Queen Victoria Street, as surely as if it were inscribed for the behoof of the beholder.

The Mansion House dates from the reign of George III., the period of its erection being 1739 to 1753, with the uppermost storey as a later addition. George Dance the Elder may be congratulated upon the result obtained, though this is largely due to the really noble Roman Doric portico and the perron beneath, lending dignity to what might otherwise prove of indifferent interest; the rusticated ground-floor storey is also a good feature. The entablature over the western flank windows would be all that might be desired were it not broken into by the windows themselves, which is an error both of design and judgment. As is so often noticeable, the balusters (except those in appanage to the windows) are thin in effect. The flank of this building is adorned with Ionic plain-shafted columns and Venetian-framed windows. Though we shall see better work in the course of our peregrinations, yet this is one which we can always regard with pleasure.

The Mansion House has, as its diagonally-placed neighbour, a block of buildings to which it stands as sponsor, and occupied by Messrs. Mappin & Webb. But the godparent of Classic extraction has, as godchild, one of Gothic proclivities; the Gothic, however, is good, be it understood. It is the plate-tracery style with acute-pointed arches that has been used, and it is a stone block with a well-managed circular sweep of building, leading round into the Poultry thoroughfare. A satisfactory effect for the whole building results from a quiet elevation, with ornament suitably displayed.

Obviously, a large number of buildings (including some probably worthy of note) must be passed over unconsidered, as the article would be otherwise of undue proportions in length. Several blocks, therefore, will now be passed, until we reach Nos. 68-70 on the northern side of the thoroughfare, and here we are confronted by a pleasingly quiet elevation, exhibiting the best portrayal of Renaissance so far surveyed west of Mansion House Buildings; there is very little ornamentation, and the entire block presents a complete and mind-satisfying appearance.

Sir Christopher Wren will play an important rôle in the buildings surveyed for this article. The first of these, the church of St. Mary Aldermary, is, however, not greatly indebted to him for design; the structure, it is true, only partially antedates the Great Fire, but it is to all intents not Wren's architecture at all. Externally, the building is not admirable, saving the imposing campanile tower at the

south-west angle. This church suffers from the ill-considered street cleavage previously referred to, the effect of thrusting its east end at an acute angle towards the thoroughfare being particularly disagreeable. The building has been very considerably restored from time to time, and on the whole sympathetically, but the more recent substitution of a solid parapet to the nave and aisle roofs is as excessively heavy as the previous open-traceried parapet was unduly light and monotonous. The two angle pinnacles at the east end of the nave-block look well.

Close by St. Mary Aldermary the two great thoroughfares intersect at a very acute angle, which, from the town-planning view-point, is a great defect.

Proceeding along Queen Victoria Street (though casting longing glances through Cannon Street towards the Cathedral), we are again confronted by a really admirable modern building in the Fire Brigade Station, which has façades in both thoroughfares. In this building (erected in 1906) we see official architecture at its best, and vastly superior to the stations for which the late Mr. Blashill used to be held responsible as superintending architect to the Metropolitan Board of Works and the London County Council. It is faced with Portland stone and is adorned on the second and third storeys with over-riding Ionic pilasters, above which is a good entablature with pulvinated frieze; an attic storey is superposed. The lower half of the building is rusticated, as also are the flanking piers throughout their height. Here too we find good balusters, for a wonder. The Ionic-adorned portion is recessed between the flanking pilastered pier-blocks, thus providing good play of light and shade.

One narrow façade near by is evidently a survival of the old street cut through at this point, but it does not merit description, except to note the quaint effect of a pantile-covered roof in such a thoroughfare as Queen Victoria Street.

Nos. 108 and 110 date back to 1873, and exhibit a Gothic façade, stone for the lower portion and the dressings, and in ordinary bricks elsewhere. There is but little of interest to note, but attention may be directed to the good monogram forming a medallion over the entrance, and to the animal "masks" used as medallions in the heads of the ground floor windows; they are good and expressive in connection with the trade of the firm for whom the buildings were erected.

We are always sorry to observe commercialism run rampant, where it takes the form of encroachments upon church property. St. Nicholas Cole Abbey is not a building to arrest our attention, it is true, but still we deplore its partial concealment by the more recent erection of business premises—and such premises!—on a portion of the forecourt. A hideous Renaissance stone abortion, with only one competitor in ugliness in the whole of this thoroughfare.

Our next stopping-place will be by the College of Arms, or Heralds' College, a work of Sir Christopher Wren's, and one upon which we never tire of gazing. Wren knew so well how to obtain effect from the judicious admixture of stone and red brick. The open forecourt, too, is apt to be picture-making, enhanced in the present instance by the stone balustrading to the parapets, safeguarding against the basement areas, and by a similar balustrading to the perron. The building is well-proportioned, plain in design but fully satisfying all artistic requirements. It is relieved by Ionic pilasters with pleasing caps, and the roof is slated.

The General Post Office block, which has served so many purposes in the course of the past few years and is now used for telephone offices, is a massive stone structure, imposing by reason of its breadth of frontage and treatment; it is not an extraordinary building, but is more than merely noticeable. The inframing of the architrave is to be noted. We cannot approve rusticated ground and first storeys over a non-rusticated basement, except where such sub-structure is effectively stronger in appearance.

The contiguous building, erected by the British and Foreign Bible Society in 1866 from the designs of Mr. E. I'Anson, is fully worthy of observation, nor, to our mind, is there throughout this thoroughfare any more admirable block. It is a good Renaissance design in stone, and it possesses an air of severe, restrained power, quite in character. Such ornament as there is is very subdued, and the effect is enhanced by the treatment of the ground storey as a plinth and by the use of a good bold entablature. The third floor window-balconies are the sole discordant feature of the design.

Another church greets the wayfarer now in St. Anne's, Blackfriars. It is of brick with stone dressings, the design being quiet and good Renaissance. The square tower is very satisfactory, saving for the starved appearance of the balusters. The boundary railings and stone gate-piers were

erected a few years ago by and from the designs of Messrs. Banister Fletcher & Sons as a memorial to the first-named gentleman, and deserve the notice of the passer-by. The church benefits from its position on an elevated site. Though important, we really cannot arrest our footsteps before the *Times* newspaper offices; they are a reproach to a great and leading journal. We will by preference retrace the street in an easterly direction, taking under notice some of the buildings along its southern side. And the first of these, nearest to the railway bridge, is St. Paul's Station, a thoroughly satisfactory and expressive piece of work, cheerfully warm in its red-brick, relieved and slightly toned down by the use of terra-cotta dressings. The proportions are good, and the slightly projecting and raised wings are pleasing; the building dates back a quarter of a century.

We must pass by a number of blocks—Renaissance, Gothic, and no-style—before we arrest our glance opposite St. Benet's Church, which stands back a few yards from the main thoroughfare. This is another work of Wren's, and though not the best it has the merit (which many of his City churches lack) of possessing an exterior that arouses interest. In the year 1879, it may be noted, there occurred a great amalgamation of parishes in this district, under the Union of Benefices Act, 1860-1. St. Nicholas Cole Abbey, St. Nicholas Olave, St. Mary Somerset, St. Mary Mount-haw, St. Peter's (Paul's Wharf), and St. Benet's (Paul's Wharf), were the parishes involved, St. Nicholas Cole Abbey (referred to earlier in this article) becoming the parish church for the united benefices, and St. Benet's being handed over to the Committee of the Welsh Congregation. The building is not one of outstanding architectural merit, but the warmth of the brickwork, the interesting swags planted unframed on the wall surface, the nice square prominent tower with its lead-covered cupola and lantern, and the charming red-tiled roof to the nave with the ancillary tiled bay roofs to the aisle provide in their *tout-ensemble* a very pleasant bit of work. The site of this church contrasts unfavourably with that of St. Anne's, Blackfriars, being on the downward grade, instead of in an elevated position.

No. 109 Queen Victoria Street is a block that demands observation. It is five storeys in height, and is designed in the Early English style of Gothic. The facing materials are stone for the ground storey, the superstructure being in yellow brickwork with stone and red brick dressings. Underneath the windows are coloured tile panels, and there is also a coloured tile frieze, whereon appear the City coat of arms and other similar devices, varied by the use of medallioned heads. The gable is not admirable with its fussy ornament and ugly crockets.

For its very ugliness we draw attention to No. 75B, erected contemporaneously with the block opposite, which we referred to earlier as encroaching upon the forecourt of St. Nicholas' Church.

The premises of the London City and Midland Bank (one of the four blocks devoted in this long street to banking purposes) are sufficiently plain, nor can this thoroughfare be congratulated upon its architectural work in this connection. The General Electric Company, too, is satisfied to dispense with art as long as it can have its business requirements satisfied; these are some of the older buildings in the thoroughfare.

And so also are Albert Buildings, erected in 1871 from the designs of Mr. Frederick J. Ward. Whilst not devoid of merit, yet this block is too restless and fussy in appearance to permit a favourable comparison with other Gothic work that we have seen in the course of our stroll. Cornwall Buildings, just above, may be regarded with greater pleasure, for in their Renaissance dress they provide a most suitable commercial block.

Architecturally regarded, we like to look at Mansion House Chambers, a nice Renaissance four-storey stone block, well-proportioned and with well-distributed ornament. The Ionic order is used effectively to the first floor, and the main frieze has a good series of swags for ornament.

In fact, the head of this thoroughfare is well treated architecturally, and No. 1 (The National Safe Deposit) provides its proper quota of satisfactoriness. It is an important stone block of five storeys (effectively only three), Renaissance in the design, which is in general plain but shows relief in the series of first floor pedimented window-heads (alternately segmental and straight), and the Ionic window-pilasters. The keystone masks to the ground-floor windows are unusually good. The circular entrance-corner is well designed, and the sole adverse criticism to be offered is in regard to the ugly range of chimney stacks along the parapet.

We will now turn our attention to the Cannon Street and

Ludgate Hill route—Cannon Street being less interesting architecturally so far as modern buildings may be concerned, but with greater wealth of historic interest.

The old name of Cannon Street was Candlewick, but to get contemporary with that name it would be necessary to retrace Time's track to the early days of the eighteenth century—perhaps even more remotely still. If we are to believe that the "London Stone"—the supposed *milliarium* of the Romans—is a locally topographical relic, then the antiquity of this thoroughfare is well established; we know that Watling Street, close by, is of Roman date. The *milliarium* was the stone used by the Romans as a distance measure gauge to all parts. We have also read of this thoroughfare as Canning Street, our source of information being the diaries of that delightful Stuart subject, Samuel Pepys, who also refers to Gracechurch Street as Gracious Street; but it is just possible that these are errors of transcription from Pepys' elaborate cypher.

Throughout Cannon Street there is, as a whole, an altogether shabbier air architecturally than appertains to its intimate neighbour, Queen Victoria Street. The buildings are possibly older, for one thing, and it is also proper to bear in mind the different nature of the business carried on in the two thoroughfares, so far as those portions westward of Mansion House Station are concerned. The first really interesting view obtained working westward (and glancing along the northern flank of the street) is that of the church of St. Laurence Pountney, which, in fact, is not in Cannon Street at all. Nor is this sample of Wren's exteriors greatly admirable. With most of his City churches it is the promise of good work within that usually proves attractive, a promise not invariably fulfilled, though the church under consideration is not one of the exceptions. Its slated, hipped roof conceals a domical interior, having Welsh vault lights. *En passant*, it may be noted that the painted decoration of this domed surface, the work of Sir James Thornhill, was an experiment (and a very successful one) for the work proposed to be done (and subsequently executed) at the Cathedral. The Grinling Gibbons carving, whether by himself or his pupils, is excellent in this church, as it is in all Wren's interiors. The plain exterior is relieved by the squat brick and stone tower with lead-covered bulbous and peaked spire.

In our walk from King William's Statue, Nos. 123 to 127 Cannon Street provide the first thoroughly satisfactory design actually fronting on the thoroughfare on its northern line. A quasi-symmetrical Tudor design in red brick and terra-cotta, it may be regarded with pleasure; the two supporting gables do not profess to be alike, but they harmonise well, and the shallow bays running beneath, with sufficiently varied head-treatment for the windows, help to produce a satisfactory design. No. 121 is a decent stone façade, plain but effective; it is, however, impossible to approve the heavy blocking out of the architrave voussours. And No. 117 is a respectable commercial block, exhibiting a free use of red granite columns, the façade elsewhere being in stone.

We must arrest our footsteps opposite St. Swithin's Church, in whose southern wall we notice the "London Stone" enriched. This is another of Wren's numerous, though not innumerable, City churches, but it compares unfavourably on the whole with St. Laurence Pountney, though it is of interest to note the same general domical and hipped roof treatment accorded to both churches. St. Swithin's tower is, however, greatly superior to St. Laurence's; it is massive in appearance, built in stone with lead-covered superposed spire. But the exterior of the church generally is poor, and as much may be said for the interior, not excepting the stained glass, the general effect being tawdry and not to be compared in favour with St. Laurence Pountney.

The General Assurance Company's premises deserve a passing glance. This is a Gothic stone façade, with red granite pilasters to the ground storey, and with stilted semi-circular window-heads. The main ornaments are dog-tooth and zigzag, whilst the whole design is quiet in effect, which in the case of domestic and commercial Gothic is so infrequent. There are various quiet and, perhaps, irreproachable designs in this thoroughfare, but of a nature that does not tend to render a street distinguished or distinguishable. There is, however, a circular corner stucco block by Budge Row distinctly worthy of notice. The circular sweep is well managed, not an easy matter in a Classic design, and the academic superposition of the "orders" is pleasing, by reason of its comparative infrequency.

Mr. H. Huntley Gordon's block, "Stafford House," is not to be commended; but it must be borne in mind that his design (such as it is) was partially hampered over the ques-

tion of rights of light, an action-at-law obliging him to cripple the design. However, we cannot suppose that the result architecturally would have been greatly different in any case. Let it be frankly conceded that it may be regarded as a matter of personal opinion, and it is this opinion that is now expressed. We would contrast this elevation with No. 25 near by, erected in 1896, a couple of years before Stafford House; it shows a piece of quiet Renaissance, the ground storey in stone, and the superstructure in red brick with stone dressings and rubbed brick pilasters. The whole is capped with a good gable, and the sparse ornamentation is nicely distributed.

No. 9, too, is a very pleasant little façade in stone; it presents an effect of solidity, relieved by projections, rather than by ornamentation.

But undoubtedly the finest façade throughout Cannon Street is the recently erected Cordwainers' Hall block, the architect being Mr. Howard Chatfield Clarke. To call this the finest block in the thoroughfare is perhaps not grammatically accurate; for though some of the buildings noticed are in their degree architectural, yet only one other (the Fire Brigade Station) deserves the epithet fine. Cordwainers' Hall shows a Portland-stone façade throughout, treated on the entrance floor as banking premises with an elaborate grey granite entrance doorway, and marble-lined staircase vestibule as an approach to the rest of the building, occupied by the Worshipful Company of Cordwainers. The ground and mezzanine floors are rusticated, and above there is a treatment of flat Ionic pilaster-work, embracing in its giant grasp the first and second floors. There is ornamentation, but not too much of it, the coat of arms carved in the grey granite being admirable. We can never, however, approve broken based pediments, which are opposed to the canons of good pedimental construction.

There is not much on the southern side of Cannon Street that appeals to the artistic eye; some of the blocks are passably satisfactory, but they are not of a nature to arrest attention, saving the Fire Brigade Station, previously referred to. Of course, the Cannon Street Hotel obtrudes itself upon the wayfarer's notice, but assuredly not by reason of its architectural virtues; it misses the qualities that render the Charing Cross Hotel pleasing, but we may suppose that Mr. E. M. Barry, the architect, whilst desirous of showing the close family relationship between the two hotels was determined that the differences should be as marked as the likeness.

And what can be urged in favour of Burroughs' Adding Machine Buildings over against the Hotel? Truly, nothing; the block is quite modern and quite ugly, it lacks style though not colour—but such colour! Green glazed bricks combined with yellow stone pilasters and dressings; shades of our forefathers, turn your gaze elsewhere!

Now the contiguous block of buildings is worthy a passing glance, unpretentious as it is and colourless; it is faced with grey stocks and stucco, and possesses a good first floor window, adorned with Corinthian three-quarter columns and pilasters. The fact is that this thoroughfare lies under the blight of commercialism, a blight that used to pervade St. Paul's Churchyard until the re-building of some of the southern blocks introduced architectural elements that raised the character to a less humble level of non-achievement. Not that we regard these phoenix blocks with pleasure, for though here and there (as in Nos. 15 to 18) the eye may be attracted, for the most part the aforesaid elements are not at all pleasingly combined; indeed, Nos. 1 to 4 are distinctly ugly, and only partially redeemed by the use of blue-grey Labradite to the ground floor.

We purpose now to relieve the eye-strain to which we have been recently subjected by wheeling about, in order to regale our sight by inspecting St. Paul's noble pile. It is thirteen centuries since the founding of the cathedral, when King Ethelbert was on the throne of Kent. It is a pity that Wren's magnificent scheme of town-planning for the City of London was not realised—at any rate so far as the vistas to St. Paul's are concerned; as it is, there is no means of obtaining a good view of the building as a whole, and the approach along Ludgate Hill, despite the widening of that thoroughfare some years ago, is very indifferent. What the proposed new Thames bridge and approach road will do in the way of vista in the not-distant future is also not a matter of pleasurable anticipation. But taking count of such views as are already obtainable, we confess our unbounded admiration of this masterpiece of Wren's. In some former criticisms the view has been expressed that a great portion of the pleasing effect of the City church interiors results from the Grinling Gibbons carvings. Of course even then there are exceptions. But in the case of

the Cathedral, were there no carved ornament at all, the work would still be a fine artistic conception, finely carried out. That there are some counterfeits in the design must be admitted, but it is not for us to cast the first stone. The dominating dome is, of course, a metropolitan feature and satisfies by its excellent contourings, with the well-adjudged counterweight in the superimposed lantern and finial. The west front, whilst not entirely pleasing by reason of the two orders of colonnades, works in well, however, with the whole block, and the two towers have that combined Gothic-Renaissance effect, in which Wren was prone to indulge. Of the two flanks, the southern is the one that lends itself to better inspection, which it well repays. This fane is an instance of the want of value of æsthetic plan for the production of an æsthetic elevation; for the ground-plan of St. Paul's is not admirable so regarded; and it is more than doubtful whether the elevational effects of the original scheme, which provided a truly artistic plan, would have been satisfactory. As it is, one never tires of looking at St. Paul's, both in bulk and in detail. The north and south porticoes are "things of beauty," and Grinling Gibbons' carving is assuredly a "joy for ever." There are those who cavil at the over-refinement, the exaggerated delicacy of these little pictures in stone, but in that company we are not included. Whether it be the charming little cherubs' heads, the fruits, flowers or trophies, there is the same excellence of treatment and of technique, and the same completeness. How fine, too, are the cast-iron boundary railings; there is the same pleasure in looking at these as at the railings to Hope House in Piccadilly. But we must stop now. Well might Wren's epitaph in St. Paul's read "Si quaeris monumentum, circumspecte."

And at last we are approaching the end of our saunter as we enter Ludgate Hill, merely noting, in passing, the fine statue of Queen Anne (in whose reign the cathedral was finished); this is a replica of the original statue that stood on the site. On its pedestal we see the quartered lilies of France, a proprietary pretence long since surrendered by England.

Ludgate Hill at its foot once formed one of the two direct western frontiers of the City proper, Temple Bar being merely an outwork further west, as Holborn Bar was with respect to Newgate. A relic of old Ludgate still exists in the statue of Queen Elizabeth now installed in the recessed façade of St. Dunstan's-in-the-West Parochial Schools in Fleet Street, but formerly occupying a niche over the central arch of old Ludgate. To possible Jewish readers of this article it may be of interest to record that, embedded amongst the other stones of the gate (which was removed in 1760) was one possessing Hebrew characters to the effect that "This is the ward of Rabbi Moses, the son of the Hon. Rabbi Isaac." A gate had existed on this site (though frequently rebuilt) for over eighteen centuries.

Having strolled to the foot of the hill in order to descend upon Ludgate, we will now wend our way eastward, looking at first at the buildings on our left. And, passing some, we will glance at the premises of the Express Dairy Company, built a dozen years ago; it is a good commercial façade in brown stone, relieved by some faience to the ground storey. The design is plain, and what ornament there is is well distributed. Messrs. Hudson Brothers' premises celebrated their majority last year, and are worthy of notice; they form a mixture of Gothic and Renaissance, for the ground and first storeys are in the former style, the second and third are half-and-half, whilst the carved panels and the gables are Renaissance. The effect of the red granite coupled columns of the ground storey supporting the grey granite arching is good.

St. Martin's Church cannot be said to suffer from the proximity of the leviathan close by, for even were St. Paul's far removed this little church of Wren's would still present a curiously plain, even ugly, façade. We are here confronted by a square tower, flanked by two wings of almost equal width with the tower. Their solid parapets are surmounted by huge ugly trusses. The façade is in stone and with very little ornament. The lead-covered flèche is the best feature.

Nos. 14 to 16 Ludgate Hill present a stone façade erected a very few years ago. The circular corner block and the balustraded balconies provide the most pleasing portions. The curious Mansard gable is not commendable.

The buildings of the Temperance Permanent Building Society, erected originally some fifteen years ago, and quite recently enlarged as much again as their original façade and capacity, must be noticed. The front is a combination of red Mansfield stone for the ground storey and the bays, with red granite columns and white stone superstructure, the contrast proving not unsatisfactory. The design is Renaissance.

but is very indifferent, and the winged figures in the arch-spandrels look uncomfortable. There is somewhat of an excess of ornament.

On the southern side of the thoroughfare we only desire to call attention to the premises of the London City and Midland Bank, erected twenty-one years ago from the designs of Mr. Thomas Colcutt. We can easily trace the hand of the architect of the English Opera House in these banking premises—the House so short-lived as the home of English Opera, so prosperous as a Theatre of Varieties. The ground storey, with its good, sweeping, circular arching, is in stone, with a red brick and terra-cotta dressed superstructure. The design is quiet Renaissance. The gables are rather poor and unsatisfactory.

And as we pass under the really picturesque railway bridge and enter into our offices in the Circus we feel that our readers and ourselves will be in accord now if never before in the course of our stroll; and though they may have “welcomed the coming” we are sure that they will “speed the parting guest.”

THE GARDEN CITIES AND TOWN PLANNING ASSOCIATION.

MR. RAYMOND UNWIN, F.R.I.B.A., architect of Letchworth Garden City and Hampstead Garden Suburb, is the author of a highly interesting booklet entitled “Nothing Gained by Overcrowding.”

Coming as it does from one of the leading authorities on the subject in Britain, the case against overcrowding, as presented by Mr. Unwin, is brought home by some striking facts and arguments. He has worked out with minute care and analysis what happens in the development of an estate under the ordinary or by-law method, and the result that is brought about by town planning which limits the number of houses per acre. He makes it beyond question that the advantages are all on the side of the town planner and the investor.

The pamphlet is exceedingly well illustrated by a striking number of charts and diagrams, and also photos illustrating the actual difference in houses and ground space which exists between the ordinary and the garden suburb.

It is published by the Garden Cities and Town Planning Association, of 3 Gray's Inn Place, W.C., at the price of 3d. a copy.

COMPETITION NEWS.

INDIA.—The Government of India invite architects and others residing in India to submit competitive designs for residences to be erected at Delhi. The designs will be judged by a committee, assisted by the Consulting Architect to the Government of India acting as assessor, and must be sent in by December 7. Premiums aggregating 12,600 rs. are offered for the successful designs, subject to the conditions of competition.

NEWCASTLE-ON-TYNE.—The Education Committee have been recommended that competitive plans be invited from Newcastle architects for the erection of Cruddas Park school and Rye House school.

READING.—Mr. Ernest Newton, F.R.I.B.A., has been nominated by the President of the R.I.B.A. as assessor in the forthcoming competition for the proposed Kendrick Boys' and Girls' Schools.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Ethics of Bridge Building.

SIR,—Many of your readers will thank Professor Archibald Barr for his Presidential address to the engineering section at the British Association meeting last Thursday week, in which, taking a wider view than is generally taken of the engineer's duty, he showed that there were injuries which engineers might inflict upon the community apart from those things which were done for help and physical comfort. “Every man,” he said, “even the least cultured, had some sense of the beautiful and the comely, and was affected by the aspect of his environment more than he himself could realise. There had been far too great a disregard of æsthetic considerations in the work of the engineer. There

was, or ought to be, a closer connection than was usually recognised between the work of the engineer and the artist.” He quoted the names of Michel Angelo, Raphael, and Leonardo da Vinci to prove that men might be masters in the art of construction, as well as in those with which their names were usually associated. “The separation of the beautiful and the useful was quite a modern vice.”

He had not raised his voice a moment too soon. Looking at the destruction of the beautiful bridges up and down the country by county authorities, and their replacement by bridges, whether of stone, or iron, or ferro-concrete, without any consideration of the beauty of line, we realise how necessary is the preaching of Professor Barr's gospel.

Although it is notorious that many of the old bridges shaken by the motor traffic require strengthening, and although it is also known that for a sixth of the cost of rebuilding these bridges can be made stronger than ever by means of Greathead's grouting machine, which has been used with such conspicuous success at the Grange Bridge in Borrodale, on the Chester walls, at the church of Holy Trinity, Hull, and at the Winchester Cathedral by Sir Francis Fox, and though it is known that this process, properly applied, converts a crazy, shaking structure into solid monolithic strength, one hears from time to time of an order going forth from a local authority to replace a venerable and beautiful structure by some modern ugliness in stone, or steel, or ferro-concrete, to the entire destruction of the amenity of the place and its associations; and inquiry will elicit the fact that this bridge building by county authorities is sometimes entrusted to a road engineer with no architect's training or artist's capacity. The idea of its being a plain duty to the present community and to posterity of refusing to allow any bridge to be built unless the lines of its arch, the proportion of its parapet, and the returns of its ends have all been well considered by a qualified architect, and unless the local material most in harmony has been considered, is scouted as so much sentiment or needless additional expense.

What I am more concerned about is the fact that, though ferro-concrete is still only on its trial, and though as yet, so far as I can learn, except in America, no serious attempt has been made by architects to give beauty of line and artistic consideration to the material, this said ferro-concrete is thrust upon the public because of its comparative cheapness; and, to judge by such designs as I have seen in the catalogues of ferro-concrete makers, the artist has been largely left out of count.

“Man doth not live by bread alone,” and at a time when in our elementary schools the children are beginning to learn the worth of line and colour, and when it is to be hoped that the sense of beauty will slowly become a possession of the people, it is very well for us all to remember in Professor Barr's words, “That a structure of any kind that was intended to serve a useful end should have the beauty of appropriateness for the purpose it is called to serve.” And the beauty of a bridge does not only serve to provide a thorough rush over for motors at twenty miles an hour, but ought to provide also for the heart's delight of the foot passenger, who finds that living thing of beauty, a stream or flowing river, is spanned by a living thing of beauty—the nobly planned bridge.—Yours, &c.,

September 14, 1912.

H. D. RAWNSLEY.

The Prevention of Corruption Act.

SIR,—It seems from inquiries which have reached me that the provisions of the Prevention of Corruption Act, which forbids, under heavy penalties of fine or imprisonment, the asking for, or receiving, the offering or giving of bribes or secret commissions are still unfamiliar.

Many persons in the architectural and allied professions appear to be equally unaware of the existence of the Secret Commissions and Bribery Prevention League, Incorporated (President, the Right Hon. Sir Edward Fry, G.C.B.), which was formed to enforce the Act, to advise, warn and, if necessary, to prosecute, and has a large and influential membership.

If any of your readers desire any information which it is within my power to give I shall be glad if they will communicate with me.—Yours, &c.,

THE SECRETARY OF THE SECRET COMMISSIONS AND BRIBERY PREVENTION LEAGUE, INCORPORATED.
3 Oxford Court, Cannon Street, London, E.C.

MR. W. D. CAROE, F.S.A., F.R.I.B.A., is preparing a report as to the best means of preventing damage to Romsey Abbey through lightning.

FORTHCOMING EVENTS.

- Saturday, September 28.*
Northern Architectural Association : Students' Sketching Club.
- Monday, September 30.*
Iron and Steel Institute : Autumn meeting at Leeds (five days).
Architectural Association : Day and Evening School re-opens.
- Tuesday, October 1.*
Royal Society of Antiquaries of Ireland : Special General Meeting at 5 P.M.; Quarterly General Meeting at 8.30 P.M. at 6 St. Stephen's Green, Dublin.
- Wednesday, October 2.*
Royal Society of Antiquaries : Excursion to Fore, Co. Westmeath.
Institute of Sanitary Engineers : Opening Sessional Meeting at Caxton Hall, Westminster, S.W., at 8 P.M.
- Friday, October 4.*
Royal Sanitary Institute : Provisional Sessional Meeting at Lewes (two days).

THE ECONOMY OF A GARDEN CITY.

MR. RAYMOND UNWIN'S little pamphlet entitled "Nothing Gained by Overcrowding" is a clever piece of pleading on behalf of the Garden City and Garden Suburb movement. He looks at the subject of overcrowding houses on to land fairly and squarely from different points of view. He admits, as, indeed, he is obliged to do, that a large number of houses per acre brings an increased profit to the individual speculative builder who has but a small parcel of land to develop and looks at his own acre of land only. Mr. Unwin has also to admit that the Garden City principle of giving each house a larger portion of land must mean a higher ground rent per house, or, in other words, that if people have bigger gardens with their houses they are obliged to pay something for them, so that the Garden City campaign must have for its objective the conversion not only of landowners and house builders, but also of those who rent houses.

Thus in working out a scheme as illustrated by diagram in his pamphlet with land at an assumed value of £500 per acre, on a square ten-acre plot Mr. Unwin compares the result of building 34 houses to the acre with that of building 15.2 houses. With the former he says that each house would have an average plot of 83½ square yards costing in ground-rent 8d. per week, and in the latter case the amount of land to each house would be 261½ square yards, but the ground-rent on the same basis would have to be 11½d., and herein lies the difficulty, for, as Mr. Unwin says, "Unfortunately the majority of people, and particularly occupants of small houses, which are the ones most usually overcrowded, care chiefly to get a house of some sort at the least cost, and have no means of knowing, because no choice is ever put before them by which they may judge, that they are paying at an extravagantly high rate for their small plots as compared with what they might pay for much larger plots."

Tenants, therefore, have to be persuaded that it is a good proposition for them to pay a little more rent, as by so doing they will get better value for their money, but it must still remain one of the problems which Garden City promoters have to face that houses and gardens must be provided at rents which people can afford to pay. It is no use telling a man that if he takes an acre of land he can get it at a cheaper rate than if he took a perch, when he can only afford to pay for the perch.

The position of the speculative builder and the landowner with regard to the Garden City movement is shown by Mr. Unwin to depend upon the extent of their interest. If the speculative builder is only dealing with a limited

amount of land it is more profitable for him individually to squeeze on 34 houses per acre, but if he has control of sufficient area to build the 34 houses on two acres and sufficient capital to deal with the extra land, he would then be just as well off by following Garden City principles. Similarly with the landowner. If he has only a limited amount, it would be true in any instance that the more houses that could be crowded upon the land the better for him with the larger number of ground-rents at a proportionately higher rate, but if by extension of the area over which the houses are spread he can bring a larger proportion of his land from agricultural use to a building estate, then Garden City practice means better returns to him for his land.

The essential factor in the successful development of land on Garden City principles and of Mr. Unwin's finance is the cost of roads, and the Garden City movement can only fully prosper by reducing the proportionate cost of roads per house. This reduction may be effected in two ways. By proper planning the length of road required per house may be diminished, and what is of even more importance, the cost may be lessened by a modified character of road.

Mr. Unwin rightly takes account of one point that has to be carefully controlled when the number of houses per acre has been limited. There is a temptation for the speculative builder to put bigger houses on the bigger plots, and these houses may then become too big for the tenant to pay the rent, so that he takes in lodgers, and overcrowding results by the increased number of persons per acre to possibly the same extent that would have been produced by a larger number of small houses, so that in regulating the number of houses per acre consideration must also be given to the cost of these houses.

From the point of view of the public benefit Mr. Unwin deals with the relative effect of building a town on the system of crowding 34 houses on an acre or reducing the number to 15 per acre. Assuming, for the purpose of illustration, a town in which an increase of population of 17,000 takes place every year, he shows that the increment value of land taken over from the agricultural area and devoted to building on Garden City lines with houses at the rate of 15 per acre would provide an increment of £102,150, as compared with an increment of £45,000 if the land were occupied at the rate of 34 houses per acre. He goes on to consider the effect which the extra acreage required to provide for the population with the limited number of houses to the acre will have upon the size of a town, in order to meet the possible objection that a very serious difficulty would arise in the distances to be covered in travelling from the centre to the circumference, and he gives diagrams

showing the bearing this question would have on a theoretical development of London on Garden City principles.

The area of London administered by the London County Council he represents by a circle having a radius of $6\frac{1}{2}$ miles. Taking the population of this area at five millions, which is at the rate of 64 per acre, he suggests that it might be possible to reduce the density of the population of the County of London to an average of 42 per acre by inducing one-third of the people to live outside the boundary, and he shows that the present population of Outer London with those who are to be persuaded to move from Inner London and an additional 4,024,165 people may be accommodated at the rate of 25 per acre within a circle having a radius of $14\frac{1}{2}$ miles, which is approximately the size of the Metropolitan Police area, so that a total of twelve millions might be distributed within the present area of Greater London instead of eight millions as now, it being possible to accommodate this latter in an area having a radius of $11\frac{1}{2}$ miles. The parts of Greater London, that is, the Metropolitan Police area outside the County of London, are evidently at present more desirable to live in than Garden City experts deem necessary, for they are capable of accommodating one-third of the inhabitants of the County and an additional four millions beyond their present population without exceeding the desideratum of 25 persons to the acre. But still there is, in parts, overcrowding in Greater London, nay, there are even slums, and a town-planning scheme for the whole area is urgently needed to prevent undue crowding by the owners or exploiters of small parcels of land. Mr. Unwin argues very truly that, although the limitation by a town-planning scheme of the maximum number of houses that may be erected upon the acre of land will cause loss to some, it is probable that no change can be introduced, however beneficial, that will not cause individual hardships. We would put the case more strongly. Overcrowding is detrimental to the public weal, and no individual ought to be allowed to make a profit out of the public detriment by overcrowding the land any more than by adulteration of food.

NOTES AND COMMENTS.

THE fragmentary reports and descriptions of the presumed unsafe condition of Sta Sophia, Constantinople, have now been brought to a definite form by a letter in the *Times* from Mr. T. G. Jackson, R.A. After giving a short description of the construction of the church, he thus proceeds to describe the mischief that has occurred: "Seen from the floor of the mosque a terrible bulge in the north-east pendentive catches the eye at once. But it is not till one ascends the dome that the full seriousness of the mischief can be appreciated. From the gallery surrounding the base of the dome it is apparent that the plan is no longer circular, but is deformed, and that the great arches have also suffered distortion. The dome consists of 40 ribs of brickwork covered with mosaic now plastered over, with brickwork between rib and rib, the whole meeting on a ring at the crown. The crown seems to have sunk, and many of the ribs have also sunk so much that some of them are in some parts nearly, if not quite, straight instead of being convex, and have, therefore, lost their arch-construction. That the dome still hangs in air and has not fallen is due to the singular stability of that form of construction. Writing as I do from the island of Ischia I observe that whereas most of the ordinary churches were thrown down by the earthquake of 1883, and are in ruins, those that had cupolas are still standing. Turning to other parts of Sta Sophia I found by plumbing the walls and columns that they were out of the perpendicular chiefly on the north and south sides, and some of the vaults, especially in the gallery, seem in danger of collapse."

Of the remains of mediæval buildings around London few are of greater interest than the church of St. Margaret, Barking, and an interesting little brochure by Miss Marion

Elliston gives an historical sketch of the church and its associations, whilst making a strong appeal for funds to enable the present vicar, the Rev. John Warmington Eisdell, to continue the restoration of the church as a national monument and treasure house of history and tradition.

The prospectus of the Royal College of Art for the coming session indicates that the work is to be continued on practically the same lines as heretofore. It is still provided that students must, save in exceptional cases, take up the study of architecture before specialising in either of the four schools, namely, architecture, ornament and design, decorative painting, or modelling and sculpture. The architectural school consists, as before, of a lower and upper division, and it is clear from the prospectus that for architect students a high level of study is intended, with special attention to the inclusion of painting and sculpture as part of an architectural design.

The evil effects of the Land Clauses of the Finance Act, 1909-10, and particularly the hardship which its administration is having on small owners of property acquired by thrift, are well set out in a pamphlet entitled "The Blight on the Countryside," by Frank Alton Morgan, and dedicated, we presume without permission, to the Right Hon. D. Lloyd George, Chancellor of the Exchequer. Anything which checks the development of land injures the prosperity of the building trade, and we are not surprised that the figures which the author gives show that during the summer of 1909 the value of houses built in London was £920,597; the following year, as the dangerous nature of the Finance Act became known, it dropped for the same period to £856,265, and in 1911 to £603,164.

Next week the Architectural Association commences its winter work, both in the day school and in the evening school. The day school now comprises a three-years' course, the work of the third year being directed more to advanced design, draftsmanhip, and theoretical and practical knowledge. The staff for the coming year has been somewhat modified from that of the past session. Mr. H. P. G. Maule is the headmaster; Mr. Robert Atkinson, visiting master in design; Mr. C. E. Varnell, lecturer on theoretical and practical construction; Mr. Alan Potter and Mr. W. I. Keir, day school assistant masters; Mr. J. B. Scott, evening school master. Besides these gentlemen, Mr. Theodore Fyfe lectures on Greek and Roman architecture; Mr. Aymer Vallance on mediæval architecture; Mr. W. H. Ward on Renaissance architecture; Mr. A. O. Collard on professional practice; whilst Mr. E. Constable Alston gives instruction in the life class and Mr. H. F. Waring in the water-colour class.

The Parks Committee of the Edinburgh County Council have in consideration an improvement of Calton Hill. They had a report on the subject prepared for them by the City Superintendent, the Superintendent of Parks, and the City Road Surveyor, which report is of a fairly conservative nature. The remarks of these officials on the subject of monuments contained a good deal of common sense. They say "the question of sites for monuments was rather a difficult subject, as, until the style and character of a monument was known, it was somewhat invidious to permanently allocate sites on the plan. The promiscuous placing of monuments on the hill was as a general policy of somewhat doubtful expediency, and would require very careful consideration." We are not so fully in accord with the suggestion that on a semi-lunar bastion, which might be formed from the terrace at the south-west tourelle of the old Observatory building, a good position would be available for a telling piece of sculpture, which would show up boldly on the sky line from a variety of directions. We do not think sculpture showing up boldly on the sky line is placed under the happiest conditions.

CLEVEDON COURT.

In distributing the prizes to students attending the Rochdale Technical School and School of Art, Professor Sadler, Vice-Chancellor of Leeds University, expressed his disappointment that hardly any member of the Sketch Club gave his or her view of the industrial landscape of Lancashire or Yorkshire. Professor Sadler also spoke of certain cross currents which seemed to him to be running strongly with regard to the ideas of teaching in England. One current was running strongly towards a stricter educational discipline. There was a reaction, felt as strongly by teachers as by others, against making lessons too easy and too attractive. It was felt that in order to be prepared for the real difficulties of life school work should require a number of things dull and repellent in the first stages, things to be done with effort and against the grain, by endurance, and by dogged self-discipline. A number of things which had been out of fashion seemed to be coming into vogue again. Drill in grammar, exactness in translation, correctness of line and perspective in drawing, clearness and precision in writing—these were all symptoms of the desire for strict intellectual discipline, not as an end in itself but as a means to attaining that mastery and freedom in the use of the powers of the mind which was a necessary preparation for all higher intellectual achievement. On the other hand, there was a current running just as strongly and often in the opposite direction—the desire for self-expression and the development of artistic individuality. There had been a rebellion against the gaunt ugliness of the old-fashioned schoolroom, against the stupid conventionalism of the sleeper kind of classical teaching, against mechanical test-tubing in laboratory work, against the neglect of music and colour and rhythm of physical movement as essential forces in humane education, and, not least, against the dullness of mind which neither stimulated nor approved originality in other people.

One of the most striking phenomena of our modern life is the development of noise, and the Manchester Education Committee have been discussing the trouble of noisy traffic outside many of their schools, causing discomfort, injury to health, and hindrance to good teaching. The Committee do not seem to have been able to solve the difficulty of protecting their schools from the noise of lorries using the kerb stones as brakes on the wheels, motor engines stopping close to the schools, and tramway cars clanging as they cross points. Amongst the specifics which were advocated by various speakers were wood paving, rock asphalt paving, and double windows, but none of these were regarded as altogether

satisfactory or a perfect cure for the trouble in some of the later schools which were placed too near the public highways. The only effectual precaution seems to be that adopted by the Committee in building schools nowadays, to be careful to put them far away from noisy streets and to allow more space for playgrounds than their predecessors did.

CLEVEDON COURT, SOMERSET.

AMONG the many stately homes of Somerset, Clevedon Court, the seat of the Elton family, and one of the finest existing specimens of mediæval domestic architecture in England, holds a pre-eminent position. Situated on the Bristol road about one mile from Clevedon railway station, the handsome old structure occupies an exceedingly picturesque position, with the trees and shrubberies of Court Hill rising immediately in the background.

For centuries the mansion has been the manor-house of the lords of the manor, and was first in the occupancy of the Wakes, who claimed their descent from no less a distinguished personage than the great Hereward.

Built on the usual plan of the letter H, of which the Hall formed the cross stroke, separating the offices from the domicile proper, the present building is chiefly Elizabethan in style, although portions of the original Edwardian structure are still intact, notably in the porch, with its portcullis grooves, the Hall, and kitchen. The south front exhibits a rich yet reticent aspect, while the fine fourteenth-century gables and reticulated tracery of the windows greatly enhance the beauty of its pinnacled broken outline. The porch contains two doorways with Decorated mouldings, and in the outer arch may still be seen the grooves for the portcullis, the windlass of which is still preserved in the turret overhead. From one of the angles of the porch a newel staircase leads to the minstrel gallery overlooking the Hall, where are many family portraits. The Elizabethan gables are adorned with faces cut in stone, and the gable between the porch and the kitchen bears a female effigy with an enormous ruff, the identity of which is popularly assigned to Queen Elizabeth. On the summit of this same gable is a large bear cut in stone, with the remains of a rugged staff, one of the best known crests of the Earls of Warwick. In connection with this it is interesting to note that in the thirty-eighth year of the reign of Henry VI. Thomas Wake held at his death the Manor of Clevedon of Richard, Earl of Warwick.

Entering the porch, and passing through the fine fourteenth century doorway, one can ascend the tower or turret by means of the old stone steps, and, emerging on to the lead roof, enjoy a charming view of the beautiful Mendips. Below stretch far and wide the gardens of the Court; a fine Spanish chestnut, a Scotch fir, and a weather-beaten plane tree keeping guard over the entrance gates.

The great hall is oak wainscotted, and boasts a fine Tudor

CLEVEDON COURT.

chimney-piece; the oak roof being hidden by a modern flat ceiling. In the gable above the flat ceiling are two interesting windows, remindful of the time when chimneys were scarce and smoke abundant. In the arches of these windows are curious apertures through which the smoke escaped, and evidences are not wanting to prove that in the old days the hall suffered much from the smoke nuisance, especially in stormy weather. At the south-west angle is a room corresponding with the entrance porch, which, jutting out boldly from the Hall, with the ancient Decorated window above, contributes in no small measure to the beauty of the south elevation of the mansion. This apartment is now the oratory.

Other Hall doorways are of the De Clevedon and Elizabethan period, the latter richly carved in stone, and painted a rich dark oak colour. Through this doorway is a passage of wide dimensions, leading to the west portion of the house, with oak floor, and, like the hall, wainscotted with oak panels. On the left hand is the library, the mantelpiece of which is interesting. The Wake knot circles along the frieze from one side of the centre-piece to the other, above which are the initials of John Wake. An Elizabethan window in this room contains above the transom two lozenge-shaped insertions, one with the Wake knot and date 1570, the other bearing the Wake motto, "Wake and Pray." The library contains numerous "Titmarsh" relics in the form of letters, sketches, and caricatures. About the middle of the last century many distinguished people were frequent guests of the Eltons, among them Arthur Hallam, Tennyson, Brookfield, and Thackeray, the latter writing the greater portion of "Henry Esmond" there, while the mansion became the original of "Castlewood." Brookfield's intimacy developed into family relationship, inasmuch as he in 1841 married Jane Octavia Elton, daughter of Sir C. A. Elton.

The drawing-room is a very handsome apartment, containing interesting features, one of which is a beautifully moulded Elizabethan window looking due south, which was for years blocked up. The mantelpiece is a marvel of exquisite design and workmanship, and was installed in the reign of William and Mary by John, third Earl of Bristol, to whom Clevedon Court and Manor had passed from the Wakes, who had become sadly impoverished through their allegiance to the ill-fated Stuarts. It is recorded that this room was formerly so little appreciated that it became the stable for a pony, a tradition which has since been decried as a gross libel on the pony as well as on the magnificent apartment. On the death of the Earl of Bristol in 1698 he left directions for the

property to be sold, and his widow, Lady Rachel, accordingly disposed of the estate in 1709 to Sir Abraham Elton, in whose family it has remained to the present day.

Among the apartments upstairs is the red room leading to the Lady's Bower, a feature of which is the beautiful flowing tracery of the square-headed window of the Decorated period, overlooking the front gardens. Opposite the red room is the oak room, which is reputed to be haunted, although the ghostly visitant is no more than a plebeian cobbler.

The State bedroom is immediately above the library, and from it is reached the chapel in one of the original turrets of the south front. The piscina *in situ*, the fourteenth-century arch, and the two windows with handsome reticulated tracery are among the treasures of the chapel.

In 1767 the west front, which had become dilapidated, was rebuilt to correspond with the older portions of the premises. The windows were then of the Queen Anne period, one or two of which remain in the north front. After the demolition of the west front a façade was erected, chiefly remarkable for its lilliputian battlements and windows surmounted by ogee arches of very feeble type. This front possessed a passable resemblance to the Middle Ages, but altogether the attempt must be marked down as an abject failure. In 1862 it was again altered, no attempt being made this time to vie with the old structure, and consequently it remains comparatively modern.

The name of Elton is well known in the art world in connection with the Elton ware invented and manufactured by Sir Edmund H. Elton, the present owner of the Court.

A common sort of fusible bluish clay found in the neighbourhood is used, the decorations being formed by the same kind of clay, coloured by the addition of various oxides. A distinguishing feature of this ware is that the decoration is never repeated, no two pieces being alike. Sir Edmund employs no workman who has worked in any other pottery than his own, his assistants, who are all natives of Clevedon, being trained by himself. The pottery is situated near the stables, and pieces of the ware are placed in the gables and niches of the summer-house and outbuildings.

In 1882 a fire destroyed the greater part of the residential portion of Clevedon Court, but, fortunately, the older section of the premises escaped. It has since been carefully restored, and, with its mullioned windows and creeper-clad walls, presents a most attractive appearance. Indeed, Clevedon Court is at the present time one of the most beautiful of the many beautiful courts and manor-houses of Somerset.

SELBY ABBEY.

DR. SOLLOWAY, vicar of Selby, contributes an account of Selby Abbey to the September issue of the *Diocesan Gazette*, which, in view of the fact that the south transept was dedicated on September 26, is of special interest at this time. The article states:—

The Abbey Church of Selby has never reached a state of completion, but twice before in its history it has approximated to structural perfection as nearly as it does at the present time. The former of those periods was in the opening years of the thirteenth century, when, after a hundred years' work, a cruciform church stood on the site, generally following the "plot" that had been marked out by its designer—Hugh de Laci—the second abbot.

Though in general following the original design, slight changes had crept in with the alterations of architectural "style," and about the year 1220 the work of building was finished, and the church consisted of a central tower and a nave arcade of four Norman and four transitional bays, with a triforium on the north side partly Norman and partly transitional, and one on the south side partly Norman, partly transitional, and partly Early English, the clerestory on both sides being Early English. The transepts, north and south, were Norman, and without aisles, but each of them was terminated on the east side with a Norman apse, whilst the aisles of the nave were continued eastward beyond the crossing, each having an apsidal termination, built square on the exterior, and flanking a central apse which projected further east. So the church was finished in Early English times, and it must have been a fine composition, with its nave, transepts, tower, and choir of five apses. But at the west end the building was not completed, for though the foundations were laid for two western towers, these were only carried up to the height of the nave walls, and were then, as they have been ever since, dwarf towers.

The second date when the Abbey Church approached completion was about the end of the fourteenth century. In the opening years of that century the authorities became infected with the general desire for a more ornate choir, and a scheme was set on foot for the erection of one in the "decorated" style, the old one to be left standing till the new one was finished. The work was begun at an unfortunate time. The wars with Scotland were being fought, the hundred years' war with France was begun, the Black Death came, and numerous other obstacles interfered with the progress of the undertaking. But the various abbots took up the work of their predecessors, and about 1370-80 the decorated choir was finished, its east window being flamboyant and filled with glass representing a "Jesse," with a "Doom" in the tracery, which in later years was pronounced the finest in Europe. But the choir, which to the uninitiated seems perfectly homogeneous, is, after all, a composite one possessing "decorated" features representing every variation of that changing period, and all the more beautiful for the slight architectural differences. But even the choir was never finished. A stone vault had been contemplated, and preparations for flying buttresses made, but for some reason this part of the design was not carried out, though the clear intention of the original design is still evident in the stone springers of the vaulting to be seen internally and in the "tushes" for the flying buttresses, which may be noticed outside. But though the work contemplated was never absolutely completed, a fine building the church must have been at the close of the century, when, the Norman apses removed, the structure was practically that which we see to-day—a cruciform church with a big tower at the centre, its west front flanked by two dwarf towers.

In this condition the edifice remained, with slight alterations in some of its windows and with the addition of the Perpendicular Latham chapel east of the north transept, until the Dissolution. That historic event meant much for a monastic church of the magnitude of Selby. Its emoluments were entirely swept away, but for some unknown reason the edifice was spared in its entirety. In the general run of things, when the church of a religious house was allowed to remain, it was either the nave or the choir which was spared and used for parochial purposes, but in this instance the whole church escaped destruction, and has come down to us as the only entire Benedictine church in Yorkshire still used for Divine worship. But, as could only be expected, a great building of this description proved a burden when left as a heritage to a small town, the moneys bequeathed for its upkeep having been confiscated. The consequence was that very often the benefice had to be held in plurality with others, and in consequence of poverty and absenteeism a period of neglect and decay set in. In 1690 the upper part

of the great central tower fell, carrying with it the south transept and a portion of the south choir-aisle. A few years afterwards the tower was restored in a much debased style, but the transept, miserably patched up, was allowed to remain till a couple of years ago, a blot upon the splendid building, the south side being unrelieved from east to west, and presenting a somewhat monotonous appearance.

The lowest point in the period of decline seems to have been reached about the beginning of the nineteenth century, when the nave was unused except as a place for the storage for market stalls and for the drills of a local corps of riflemen, the guns kept at the west end of the north triforium, and the ammunition stored in an unlit parvise over the north porch. But this was only the darkness before the dawn. About the middle of the century a better state of things was inaugurated. The churchyard was put in order, the nave walls were straightened, the sodden earth cleared to a considerable depth from the exterior of the building, the floor of the nave lowered to its original level, and an unsightly partition wall separating choir and nave taken down. These nave repairs were followed about twenty years ago by the restoration of the choir, when, at a cost of about £15,000, the whole of the eastern portion of the church was put in to excellent order, and once again the whole edifice, with the exception of the ruined south transept, was used for Divine worship. A few years later ominous signs of settlement in connection with the central tower were observed, the ultimate result being that the debased upper portion was taken down to relieve the foundations from this great weight, and a considerable amount of underpinning of the tower piers inaugurated. Though absolutely essential for the safety of the building, the result was not pleasing when viewed from the outside. That which was left of the tower was the old Norman portion, eminently suitable when first erected as the central tower of the church, with its short apsidal eastern limb, but squat and unsatisfactory for a building of the present length, and the beautiful monotony caused by the absence of the south transept was considerably accentuated by the lowered tower.

In the year 1906 it was thought necessary to improve the services of the church by the provision of a new organ, and in various ways the money was raised to carry out this project, the instrument, placed in the Latham chapel, being dedicated by Archbishop Maclagan in September of that year. But this organ was destined to have but a brief life, for only a month afterwards, on October 19, 1906, a fire originated in the very chapel in which the instrument had been placed, demolishing not only the organ itself, but causing terrible destruction in the church for which it had been provided. From end to end the building was unroofed, all the woodwork, save a small portion of the screen at the entrance to the north choir-aisle, the beautiful canopy over the font, and the bosses of the nave roof, being destroyed. The stonework was greatly damaged, but the walls were left standing, and it seemed as if another addition had been made to the "monastic ruins" of Yorkshire. But through the splendid optimism of the late vicar, backed up as he was by an army of enthusiastic workers, a scheme for complete restoration was taken vigorously in hand. Local and county committees were formed, a rousing appeal was issued broadcast, and Yorkshire people—indeed, the whole country—came to the rescue. Subscriptions poured in beyond the expectations of the most sanguine, and under the direction of the Abbey architect (Mr. J. Oldrid Scott) the work was at once proceeded with. The nave was the first portion that was undertaken. A complete system of underpinning of piers and walls was effected, the stonework, wherever damaged, was restored, the roof renewed, the old bosses repaired and put back in most cases, and so rapid and enthusiastic was the work of rebuilding and raising the required funds that on the anniversary of the fire the nave was reopened at a joyous service on October 20, 1907.

There was practically no cessation of the work, however, for the restoration of the choir was immediately taken in hand. The choir-stalls were renewed, the beautiful decorated roof restored, and a choir-screen of exquisite workmanship added. The reredos was carved by Peter Rendel, of Ober Ammergau, and the unique series of wooden aumbries on the north side of the sacarium restored from drawings, photographs and rubbings of the old ones. The sedilia and stone altar-screen had been much injured, but these and the other damaged stonework were thoroughly repaired. The Latham chapel and the portions adjacent had been greatly damaged. Infinite skill and patience, however, surmounted all difficulties, and not only was the whole of the havoc wrought by the fire dealt with, but much decay that had been brought about by natural causes, and simply accelerated by the con-

flagration, was thoroughly repaired. A new organ was built, a very fine pulpit erected, a new lectern took the place of the old brass one, the glass in the windows, wherever possible, was restored, choir and sanctuary fittings, hangings, carpets and other furniture were supplied, the eight old bells were recast and two new ones added, and on the third anniversary of the great disaster the restored Abbey Church was re-opened by the present Archbishop.

The whole of this scheme entailed a tremendous amount of work on the vicar and those who worked with him, but the result of their labours was that before the end of the re-opening services the entire amount that had been necessary—about £45,000—had practically been raised. But it was thought by some that the time had come when the disaster caused by the fall of the tower in 1690 should be dealt with, and an appeal was sent out for the rebuilding of the south transept. This brought in a sum of over £500, and with this money the foundations of the transept were laid during the vicariate of the late incumbent, so that if ever opportunity offered the work could easily be proceeded with. The wait was not a long one, for in January 1911 one of the parishioners, Mr. William Liversidge, J.P., offered to defray the entire cost of the work. This generous donor had for half a century had the interest of the Abbey Church at heart. He had been the leading spirit in the mid-Victorian restoration of the nave, and by his generosity he had done much from time to time for the good of the fabric. This gift of the south transept seemed a fitting termination of the long career of usefulness spent in enthusiastic service for the Abbey, but not long had this work been begun when the donor made a further gift, by offering to insert stained glass in the large south window of the new transept, the total cost of transept and window being about £10,000. That window has now found its place in the Abbey, and was dedicated by the Archbishop, along with the transept which it adorns, on September 26. Beneficence of this kind seems infectious at Selby, for, whilst the transept was in course of erection, another of the Abbey's benefactors came forward—Miss Standerling—and offered to place memorial glass in the great Perpendicular window of the other transept, at a cost of £800. Miss Standerling had already made an excellent gift to the Abbey by presenting a carillon which had cost £600. This is placed in the tower, the upper portion of which, in beautiful Decorated style, has been erected upon the old Norman work, and fits in most harmoniously with the exquisite work of the same style in the new transept. The glass in the south transept represents local scenes connected with the history of the Abbey and town; that of the north transept will contain scenes, historic and legendary, illustrating the life and work of St. Germanus, the patron saint of the Abbey.

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

IV.—FACADES.—DOORWAYS.—CAMPANILI.—DOMES.

(Continued from last week.)

IN Orvieto and Siena Cathedrals we have examples very rare in Italy of later Gothic fronts entirely finished. In both cases we have an elevation of great richness and much beauty of detail. They are, however, applications to the building, veneers on a large scale, for the outline of either bears but an imperfect reference to the constructional form of the building within. Gables appear for ornament without roofs behind them, and the aim of the designer would seem to have been akin to that of the scenic artist who presents us with a frontispiece and does not allow us to turn the corner or view it, save from one point. Two very important façades left unfinished in the Middle Ages, those of the Duomo and Sta Croce at Florence, have been completed within the last half century, and that of Arezzo Cathedral is now being proceeded with. These unfinished west fronts were generally first of all completed in very rough brickwork, and the marble facing was either never done at all or scarcely advanced beyond the base. One of these unfinished façades, that of Sta Anastasia, Verona, might, from the truthfulness of the church and the exquisite beauty of the arrangement of the red, white, and grey marble in its western doorway, have become one of the most noticeable in the whole of Italy; while from the beautiful

veneeing of the same material which covers the lower portion of the cathedral walls at Perugia it may fairly be thought that we have lost as much by its non-completion as by that of any other unfinished building in the country.

Italy presents fewer specimens than any other country of the transition from the round-arched to the Pointed style of building. The use of the Pointed arch was accepted at last as a necessity and cannot be said ever to have been welcomed. The first buildings in which it is seen worked out fully in detail are those of Nicola Pisano, but few examples exist of good Pointed Gothic work earlier than his time. The cathedral and other churches in Genoa are certainly exquisite works, but they appear to owe their external design rather to the influence of (perhaps) Sicilian taste than North Italian, and the exquisite beauty of the west front of the cathedral there owes a great deal, at any rate, to French influence, refined and decorated by the extreme taste of an Italian architect.

Of doorways enclosed within porches, such as we see at home or in France and Germany, Central Italy presents few examples, but its cities are extremely rich in doorways of a minor kind, among which must be mentioned such exquisite specimens as the three western ones of Sta Maria, Toscanella (Late Romanesque), those on the north and south sides of the nave of Orvieto Cathedral, that to the Lower Church at Assisi, and two particularly graceful specimens at Sta Agata, Perugia, and Sta Maria della Salute, Viterbo, respectively.

Generally speaking, these doorways are strongly suggestive of an imitation of earlier examples, such as may be seen in the very fine one of the Palazzo Pubblico at Perugia, where the arch is semicircular, though the date cannot be earlier than the beginning of the fourteenth century. Generally in an Italian Gothic doorway the opening is square-headed with a lintel often formed by an ingenious dovetailing of stones together, of which good examples occur at Fiesole, Monte-San-Savino, and in San Paolo, the most important Pointed Gothic church at Pistoja. The jambs of the doorways are sometimes only moulded, but oftener adorned with plain or twisted shafts; the sections of jamb and arch are generally the same, and if there is any sculpture it is introduced on a small scale in the lintel, as in the small doorway on either side of the nave of Orvieto Cathedral, or in medallions round the jamb and arch.

A feature which must have struck everybody who has visited the Italian churches is the extra-mural monument. One remarkably fine early thirteenth-century example, with a trefoiled arch under one of those depressed gables that the Italians were so fond of, occurs against the wall of Sta Maria della Vigne at Genoa; another of singular beauty, supported on a basement of rough brickwork, may be looked for at the angle of the Piazza San Domenico at Perugia. Here the marble shafts, sturdy and simple, support the groining and arches on each face, above which a brick pyramid forms a finish at once sufficient for good effect, and suggestive to architects who fear the naked simplicity of good work and noble ideas, and overlay them with petty detail, in too many cases only to the detriment of all the nobility of the work. Of all these extra-mural monuments, few exceed in beauty those outside Sta Anastasia, the great Dominican church of Verona. Here the Pointed trefoiled arch on each face of the canopy over the tomb springs from four detached shafts, and fits very closely into flat gables or pediments, above and from which rises a perfectly plain pyramidal mass of stone. The very simplicity of the design of these extra-mural monuments is their greatest charm, and so conscious were the designers of this that they would appear to have lavished all their care and their refinement upon their design.

One feature of an Italian church exterior will always be remembered with pleasure, and that is the campanile.

The line of railway between Modane, the French frontier station, and Turin introduces us to a very charming type of steeple, which may be called the Piedmontese. It consists of a well-proportioned unbuttered tower, with one or more ranges of windows, and surmounted by a tall plain octagonal spire resembling those met with in Gloucestershire and Somersetshire, sometimes pierced with lights, but without broaches, and at each corner of the tower is generally a species of pinnacle shaped by two slabs of stone into the form of a spherical triangle, which, in some instances, when seen in profile, bends forward slightly. One of the most engaging of these Piedmontese steeples, seen rising from the middle of one of that succession of little towns nestling under the Alps and which seems to harmonise so admirably with the scenery, is at Chiomonte, near Susa, the steeple of whose interesting little

cathedral departs from the normal type hereabouts in that it is composed of a more massive tower, surmounted by an octagonal flèche covered with lead, and recalling, in some respects, those of Hertfordshire. The tower, which is almost entirely of Romanesque architecture and built of white stone agreeably relieved with pale brown, rises from rather a tall plain base of grey stone in oblong blocks. Above this massive substructure the tower rises in six stages irregularly pierced with round arched openings, sometimes in pairs, sometimes in triplets. This irregularity constitutes one of the chief charms of Susa Cathedral tower. At the summit is a pretty piece of embroidery in the shape of a Late Flamboyant or very Early Renaissance parapet, at each angle of which is a slender octagonal turret of the same architectural character supporting a metal spirelet interrupted at about half its height by a semi-detached iron band—a curious addition, which, also encircling the central flèche, gives a piquancy to the ensemble.

This campanile at Susa, which dates from the middle of the eleventh century, stands in the same relation to all the other Lombardic towers in the adjoining Val d'Aosta, and also perhaps in the whole of Piedmont, where the existing tower of the destroyed abbey of Fruttuaria, begun in 1003 and consecrated in 1006, afford striking examples of such creations.

The imposing towers of the cathedral at Ivrea may claim greater antiquity than the interesting campanile of rather more elegant appearance belonging to the destroyed abbey of San Stefano in the same town, and which was erected by the Emperor Henry II. (the Pious) during the first half of the eleventh century.

These towers, and others in the neighbourhood of Susa, contain the oldest dated specimens of those characteristic corbel pulvins—made rather elongated to correspond to the depth of the wall. They are often cut flat at the sides, and from the second half of the tenth century and onwards were selected by the Lombard guilds for their bell-towers instead of the Ravennese corbel pulvins with a profile of the ordinary ovolo type, found as far back as the eighth century in the grand house of Theodoric's Palace at Ravenna.

Many of the towers seen in Westphalian Prussia, as, for instance, those at Herford, Lippstadt, and in the country round Paderborn, bear a very striking resemblance to those at Fruttuaria.

Between Turin and Genoa there are few steeples beyond the ordinary brick campanili of the Lombard type at Asti and Alessandria to engage the attention, but at Genoa we are confronted with quite another class.

These campanili, which are found not only in Genoa itself, but in the neighbouring country, are more northern in their character, and are plain towers with two pierced stages at the summit, divided by a chevron moulding from each other. Each stage is panelled with a corbel-table of several round arches, and pierced with windows of two or more lights. The whole is covered with a stone spire, equal in height to about one and a half stages, with a small spire—a copy in miniature of the great one—at each angle. The bell-tower of San Agostino at Genoa—a fine but unhappily desecrated church—is one of the most beautiful specimens of its class. It is ornamented with square pieces of black and white diaper, in marble, and the small spires, which have no supporting turrets, but die off against the oblique sides of the great spire, as in the central one of Tournai Cathedral, are completely encrusted with black, green, and blue encaustic tiles.

San Giovanni, another desecrated church, on the quai, has a campanile surmounted by a spire of the same style as San Agostino but simpler, while that of San Siro—detached from that fine Renaissance church—is almost unique in having small lights or squinches on the cardinal sides of its spire.

There is a striking example of this Genoese steeple in the central one of the church at San Salvatore, near Chiavari—as nearly unaltered as a building erected in the middle of the thirteenth century can be in Italy, and affording a more instructive lesson as to the original Genoese arrangement than any church of the city does, where successive alterations have defaced the original designs. The great square tower of this church at San Salvatore occupies the entire crossing. It is of three stages, of which the first is considerably the highest, with one large round-headed window on each face: each of the two upper ones has a four-light round-headed window, sub-divided by coupled shafts of white marble. Each stage is terminated by a corbel-table and chevron moulding, and the whole is capped by an octagonal

stone spire, with a smaller one at each angle, as is the custom in Genoa. This one at San Salvatore is further enriched by a dormer window on four of its faces. The Pisan and Lucchese campanili are distinguishable from other varieties by being generally divided into a succession of stages, in which the windows increase in number or size regularly as they rise from the ground. Those of the churches in Lucca admirably illustrate this type, the cathedral tower being an example of the early round-arched kind from which those of San Michele, San Frediano, and others were derived. This is, for 50 or 60 feet, perfectly plain, and then occur five equal stages, divided by string-courses and containing respectively—beginning at the lowest stage—windows of one, two, three, four, and again four lights. The tower of San Frediano is similar, but without any horizontal strings; but all these Lucchese towers are finished with forked battlements.

(To be continued.)

INNSBRUCK.

(See Illustrations.)

SITUATED amidst scenery of romantic grandeur, hemmed in by lofty mountains on either bank of the winding River Inns, the capital of the Austrian Tyrol attracts many lovers of Alpine scenery. Apart, however, from its natural beauty, the visitor in search of old work will not seek vainly in the streets and by-ways of this little metropolis, for Innsbruck bears the impress of antiquity, as do also the quaint old villages that cluster around.

On modern Innsbruck one need not dwell; it is well endowed with good public and private buildings, and from its streets at every turn fresh glimpses of the beautiful surrounding landscape are disclosed.

As it is, therefore, to the old quarters of the town that those interested in its mediæval work are drawn, attention may first be directed to the principal church (Hofkirche), the national resting-place of the illustrious dead of the Tyrol. Built between the years 1553-63 by Ferdinand I. in memory of his grandfather, the Emperor Maximilian I., it is celebrated as containing the tomb of Maximilian.

This monument is an impressive sight, with its attendant bronze statues on either side, each of which represents a real or supposititious connection with the House of Hapsburg; conspicuous for artistic merit is the statue of King Arthur of England. The tomb itself is executed in white marble, with exquisitely carved panels illustrative of the life of the Emperor, whose effigy in bronze surmounts the canopy, the tomb being railed in with excellent wrought-iron work. In the same church, in striking contrast, owing to its modern simplicity, stands the monument of Andreas Hofer, the liberator of the Tyrol, to whom cruel fate destined a martyr's death, but now of cherished memory.

The Hofburg, or Palace, in close proximity, possesses some interesting State apartments, and a collection of portraits of the Royal house.

The principal street (Maria Theresien) contains much that is interesting, and in its immediate vicinity are to be found the best examples of the architecture of old Innsbruck.

A notable example of the Rococo style is the "Helblinghaus" (Catholic Casino); in the same street rises the old Stadthurm, or belfry, whilst the arcades which enclose the street on either side enhance its picturesque aspect.

Opposite the "Helblinghaus" is the "Goldenes Dachl," or "House of the Golden Roof," perhaps the greatest mediæval attraction in Innsbruck. A late Gothic oriel, its roof is now covered with gilded bronze tiles. Its erection by tradition was attributed to Frederick, surnamed "of the empty purse," as a disclaimer against that unenviable reputation, but now proved to have been built by Maximilian I. as a memorial of his marriage to Maria Bianca Sforza of Milan, this theory being held as established by the character of its frescoes and the inscribed date, 1500. It bears a striking resemblance to the Venetian work of that period, which would bear out the suggestion of Italian influence.

Many other, but perhaps minor, objects of interest abound in the old parts of Innsbruck, which cannot be dealt with in a brief description, but no one should quit the Tyrolean capital without visiting its charming surroundings, such as Castle Ambras, so romantically situated on the wooded mountainside of the Mittelgebirge, with its noble Spanish saloon and exquisitely carved woodwork in ceilings and doors, its historical frescoes of the rulers of the Tyrol, and its wonderfully rich collection of old armour, works of art, curios, antique furniture and paintings. Then, too, one

THE MÜNZTHURM AT HALL, TYROL.

should not neglect to visit the adjoining little town of Hall, possessing in itself much of interest in its venerable churches, its old town hall (Rathaus), and quaint, hilly streets. Of Roman origin, it is still famous for the salt mines in the neighbourhood, which furnish its chief source of industry.

It is not within the scope of this article to touch upon the charm of the mountains and valley wherein Innsbruck lies embedded like a gem in the fairest setting, but should perchance any reader feel induced to visit this town, whose attractions are but faintly described, no one will do so with regret.

UNIVERSITY INTELLIGENCE. BIRMINGHAM.

MR. RAYMOND UNWIN, F.R.I.B.A., will give two courses of lectures on Town Planning at Birmingham University on Thursdays during the ensuing winter and spring terms. The first course on "Civic Design and Town Planning" will be in two parts, "Units of which the plan is composed" and "The relation of the site plan to the town plan." These

lectures will be delivered at Edgbaston in the morning, while those on "Social origins and economic basis of towns" are to be given in the afternoon at the University in Edmund Street.

LONDON.

A COMPLETE course of instruction in heating and ventilating designed for architects and heating engineers has been arranged at University College, Gower Street, W.C. The lectures will begin on October 16, and will be given by Mr. Arthur H. Barker, B.A., B.Sc. (Lond.), Whitworth Scholar.

INTERIOR DECORATION.—III.

By ALBERT E. BULLOCK, A.R.I.B.A.

GREAT BRITAIN.—II.

(Continued from last week.)

THE State rooms at Chatsworth and Hampton Court Palace, which were both in course of formation at about the same time, commencing with the year 1687, illustrate very forcibly the extreme limit of the carver and painter of the reign of William and Mary. The first mentioned was the chief country residence of the fourth Earl and first Duke of Devonshire, who was born in 1640 and died at Devonshire House, Piccadilly, on August 18, 1707. The south elevation, the State rooms and one side of the internal court are the work of Talman now existing. In 1820 Sir Jeffry Wyatville built the north wing, altered Talman's staircase in the great hall, and made several other additions in a style very much out of spirit with the delightful work of the original architect. A comparison of the productions of these two men calls for some comment. Wyatville appears to have quite lost the scale of his work, and went ahead with his alterations without any sympathetic regard for the work of his predecessor, resulting in a regrettable lack of harmony.

Mention has already been made of Samuel Watson, who spent the greater part of his life at Chatsworth in conjunction with Thomas, Young, Joel Lobb, and William Davis, the two latter men being employed by contract with Watson to execute the lime tree carving in the Great Chamber in September 1692 for £400. This room (now called the State Dining-room) is situated on the first floor, and measures about 50 feet long by 30 feet wide, and is very lofty. The ceiling here is the work of Antonio Verrio, who also painted the ceiling of the chapel. He was born about 1639 at Lecce, near Otranto, in South Italy, and studied at Naples. He spent some time in France before he was invited to England by Charles II., who hoped to re-establish the Mortlake tapestry works under the management of Verrio. This scheme, however, was abandoned, and Verrio obtained various commissions in England, one of the first being decorations for the Earl of Arlington, at Euston, Suffolk, in 1671, after which he was appointed chief painter to the King at Windsor Castle, where he had a residence, and employed his leisure moments in gardening, to such success that he obtained the Royal position of master gardener, and was given a house in the Mall near St. James's Palace. His other patrons include the Earl of Essex, for whom he executed paintings at Cassiobury Park, and Lord Montagu, at Montagu House, Bloomsbury, where his frescoes were, unfortunately, destroyed by fire. He designed the equestrian statue of Charles II. for Chelsea Hospital, which was executed by Henry Cooke.

Verrio also worked for James II., but his private practice had increased so much during the few years of this reign that he was able to dispense with Royal patronage on the accession of William III., and found his time fully occupied at Chatsworth, Burghley House, and Hampton Court, where he carried out some work for Queen Anne. He died at the last-mentioned place in 1707.

Other painters of note at Chatsworth are Ricard and Laguerre, who worked here with Verrio in 1689, and the later men, as Lanscroun, Highmore, and Sir James Thornhill.

The fine marble reredos in the chapel was carved by Caius Cibber. It is of delicate proportions and graceful outline, constituting the best preserved example extant of this sculptor.

The Duke of Devonshire wrote a descriptive manuscript account of the various works in progress, which he illustrated with coloured views of the principal features. The book is preserved in the library at Chatsworth, and is invaluable as a record of the events and names of workers engaged upon the various alterations carried out. The sculptured court at the back of the painted hall contains some fine stone and marble carving. Samuel Watson, who died in 1715, was succeeded by his son. His work has been carefully recorded by his grandson in a folio book, entitled "Designs, Agreements, and Bills of Carved Work executed at Chatsworth by Samuel Watson from 1690-1712."

Further descriptions of Chatsworth are to be found in Dr. Leigh's "Particular Description of Chatsworth," 1700, and Mackay's "Tour through England," 1724; while a more recent account is contained in Mr. H. A. Tipping's work "In English Homes," vol. III., from which some of the foregoing material has been compiled.

The State rooms contain a wealth of parquet floors similar in pattern to the typical French floor as used at Versailles

and the Louvre, Paris; while parquetry inlays decorate the panels of the overmantels in a variety of geometrical patterns. There is a wonderful freedom in the carvings, which suggests that the sculptor rejoiced in his work. The Chapel Gallery contains rather bolder carving than the State rooms. The central alcove is flanked by pedimented doors, between the scrolls of which a large vase of flowers with festoons is carved, supported on either side by winged amorini.

Words fail to describe the many features of interest and beauty at Chatsworth, which, in common with other of the larger mansions of England, has suffered from unskillful "restoration" in subsequent times. Its chief glory surrounds the State rooms on the first and second floors of the west wing. The panelling of the billiard-room on the ground floor is a mixture of importations, while the later decorations of some of the principal bedrooms vary considerably in quality of finish.

Hampton Court Palace is very similarly treated as regards the additions made for William III. by Wren. The State rooms for the most part are panelled in a very simple and effective manner, with bold bolection mouldings, dado rails, and skirtings. The oak carved chimneypieces form the principal features of each room, the walls of which are covered with pictures. The Queen's Bedroom has an interesting octagonal ceiling coved up to a central spotlight, and the majority of the adjacent rooms to this wing contain angle chimneypieces, some of which have elaborate limewood carvings applied by Grinling Gibbons and his assistants. The chapel is very dignified and quiet as regards its wainscot treatment, the ceilings being the original late Tudor vaulting, picked out in colours and gilt. In general plan these rooms, like Chatsworth, conform to the Versailles manner, with the doors facing each other, and giving a vista through the entire length of the building.

The interior has been frequently illustrated in current works, as Messrs. Belcher and Macartney's "Later Renaissance Architecture in England," and a most exhaustive history in two volumes has been compiled by Mr. Ernest Law.

J. Tijou, the eminent metal worker, was engaged there, chiefly on screens and gateways, from 1690, and issued three years later his work entitled "A New Book of Drawings" (of ironwork). He subsequently had a rival in the person of Thomas Robinson when he was engaged at St. Paul's Cathedral, London, from 1700-10.

From 1691-3 Grinling Gibbons was at work with Cornelius Austin and Caius Cibber at Trinity College, Cambridge. The Library here contains some elaborate carving with carved pierced work to the gates connecting the first bay of "classes," all of a high standard of finish.

At Oxford the dining hall of Corpus Christi College contains some simple panelling, the carving being chiefly concentrated to the cresting over the entrance doors at one end. This hall still retains its fine hammerbeam roof of Tudor days, and is lit by a clerestory of mullioned windows of the same period.

The Library of Queen's College affords a good example of the late work of the century we are describing. The decorations are not over laden, but confined to salient points where the greatest advantage and effect could be obtained. The ceiling is later than the festooned frieze, and the figures over the doorhead are well conceived. Four of the "classes" contain carved pediments with shields crowned with a bishop's mitre by way of cresting.

Stoke Edith, the neighbour of Holme Lacy, is attributed to Wren. Its quiet exterior hardly suggests the possibility of so sumptuous an interior treatment. It differs from Holme Lacy in being practically devoid of elaborate wood-carving, the decorations being obtained by the medium of the painter's brush.

The mural work of the staircase and hall suggest a French training, the architectural character coinciding with the work of Le Brun. Sir James Thornhill is associated with this work. He was born in 1675, and, being twenty-four years of age when the work is said to have been executed, had probably only just returned from his Parisian studies.

The staircase balustrading consists of twisted balusters in three heights to each stair, the newels being formed with four similar balusters grouped together. This treatment of hand-railing became very general in the early work of the following century.

Paul Foley, for whom the house was erected, died in 1699, and was succeeded by other members of the family, who had certain additions made to the decorations. The "Green Velvet Room" is tapestried with a perspective of a formal garden scene, worked by the successive wives of Thomas Foley, who resided here in 1738. The drawing-room

INTERIOR DECORATION.—PANELLING FROM WALTHAM ABBEY. (For description see page 90.)

is of the delicate carton-pierre decoration of the Adam Brothers, arranged in bordered panels to walls, and having a ceiling of the same character.

Easton Neston, Northamptonshire, erected for Lord Lempster by Nicholas Hawksmore in 1702, is a Queen Anne example. To Hawksmore is attributed the design of the Orangery at South Kensington, erected some three years later; the building was, however, supervised by Wren.

The exterior of Easton Neston is of severe Palladian type, with pilasters and columns of the Corinthian order to two storeys placed between each window. Of the interior the Long Gallery and the Great Staircase are the most successful, being carried out on the same theme as the general façade. The drawing-room suffers from a wild chaos of ideas, as though the plasterer had been permitted to adapt anything he chose and generally run riot over the walls and ceilings. It is really a most disquieting and unfortunate room to be associated with the name of Hawksmore. There is, perhaps, rather more order in the ceiling than the wall decorations, and one would like to feel assured that the latter were subsequent embellishments. That there could be so much dignity combined with such license of "L'Art Nouveau" order in a single building of its size is almost incredible, yet one is continually brought to face these contrasts of harmony and discord. The decorations of this room, having been praised elsewhere, call for some protest by way of criticism. There is, however, little necessity to trim around the subject, since a comparison with many another work of concurrent execution or previous decade will easily reveal the alternatives that were possible.

If the room was one of the last to be decorated during the possession of the house by the Earl of Pomfret, the son of Lord Lempster, it is just possible that Hawksmore's name can be relieved of the stigma the occasion demands.

The Orangery in Kensington Gardens is a pure instance of the scholarly application of this architect's work. He had not been Wren's understudy without acquiring to some advantage to himself the spirit of the master. Originally, the buildings had been based on a formal scheme, and the alcove behind the engine house of the "Fountains" at the end of the Long Water was embraced within the design. Mr. Ernest Law has found that the master bricklayer employed to contract for the work was Richard Stacey, whose

estimate of £2,599 was accepted by the officers—viz. Wren, Vanbrugh, Jackson, and Banks, who advised the Lord Treasurer to advance some of this amount. The adjacent land has now been laid out on a delightful Old English sunk garden scheme, which opens up the vista most successfully.

Within the Orangery itself the panelling is somewhat severe, but most suitable for the purpose for which it was designed. On plan it forms a long rectangle, with circular rooms at each end, and a semicircular excrescence at the rear in the centre used for storage. The sash windows are lofty and well proportioned, and the central doors are treated in the same manner, the apron pieces below the sill level being made to open to give clear access. The lime-wood carvings have, unfortunately, been whitened over, and glare somewhat at one.* The architraves and cornice are all carved in oak, and the stone trusses to the roof create the refined expression we associate with the Queen Anne period.

Good proportion, simplicity of planning, and artistic treatment devoid of affectation, combined with a suitable selection of material, was the precursor of the Georgian era.

Such is the general expression of this example and many of those we have referred to, which will ever remain a credit to the architects of the time, because of its close approach to a national style in domestic architecture which has been associated with this country, and is continually being emulated abroad.

(To be continued.)

MR. BANISTER FLETCHER, F.R.I.B.A., will commence a course of lectures on "Ancient Architecture" at the British Museum on Thursday, October 3; and another course on "Mediæval Architecture" at the Victoria and Albert Museum on Monday, September 30.

MR. TEMPLE MOORE, F.R.I.B.A., has prepared the plans for alterations and additions to be carried out at the parish church, Hendon, at a cost of £6,000. The plans provide for the removal of the existing galleries and south chancel chapel, and the erection of a new nave, south aisle and vestries, a chancel-screen, and a rood-beam.

* The whole of the woodwork of the interior has now, unfortunately, been painted white for some unaccountable reason.

INTERIOR DECORATION.—THE PRESENCE CHAMBER, HARDWICK HALL. (For description see page 103.)

THE ARCHITECTURE OF LONDON HIGHWAYS.

By VIATOR.

THROUGH ONE OF THE WORLD'S VETERAN THOROUGHFARES.

CHEAPSIDE is said to be one of the oldest streets in the world; but save for this archæological interest, it does not compare with many of the thoroughfares hitherto considered in the course of these articles.

Starting from the Mansion House westwards, we have already paid regard to Queen Victoria Street; now we will, whilst starting from the same point, leave that thoroughfare working its straight course to our left, whilst we pursue a somewhat more north-westerly and devious route through Poultry, Cheapside and Newgate Street to its junction with Holborn Viaduct.

In the reign of James I., London's chief route lay along the streets just named, with the addition of Cornhill and the various connecting ways lying towards the river.

Poultry is not an interesting thoroughfare architecturally; perhaps there is too little of it, or there may be some other cause; but its separate entity (as that also of Mansion House Street) seems a mistake, an accident; a survival probably from the days when there was a congeries of streets at this spot.

The lowest-numbered block in this thoroughfare, and situated on its south side, presents a very domestic appearance above ground-floor level; the façade is an altogether unusual one, and not to be regarded as a type. Inset-bays are customarily pleasing in narrow thoroughfares, in the present instance being employed only on the first floor, thence running up as projecting oriels for the next two storeys and as flat bay-dormers over; the canted end of the block is treated somewhat differently, though still sympathetically. In No. 6 we are confronted by a building that entirely lacks distinctive architectural "style," and is indeed of indifferent merit altogether; it presents one of those framed-in façades, which are growing in favour at the present day. In the streets of the old city, there are but few, if indeed any important ones, where the battle of the styles is not waged vigorously, nor is this short thoroughfare an exception. In Nos. 7 and 8 we see a French Renaissance elevation, very quiet in mien and with a shallow square oriel as a central feature. And then, looking on the next block, we find a reversion to Gothic. Nos. 9 to 11 are treated as three dis-

tinct premises, subjected to one design, with the Pointed window-heads pleasingly varied, though the window-shafts throughout are poor and thin; the corbel-courses are satisfactory, there is no overloading with ornament, and the tout-ensemble may be approved. Nos. 12 and 13 are Tudor in style, and are good in their red brick guise with red stone dressings; whilst Nos. 16 and 17, in Renaissance garb, deserve that special regard should be paid to the central trophy of flag and shields. Mappin & Webb's interesting block has been already noticed in Queen Victoria Street, but deserves mention again here. On the north side of Poultry, in St. Mildred's House, we are confronted by a columniated block of the Corinthian type, effectively treated in the absence of much ornamentation. A succession of poor blocks will be passed by, bringing us to Nos. 39 to 42—a Gothic stone elevation with a pleasant corbel string-course; the flat façade has a restrained effect, but possesses sufficient decoration to provide the necessary relief.

Continuing our route westwards, and passing into Cheapside, the first building on the north side claiming attention is the Mercers' Hall block, the entrance to the premises of the Worshipful Company being elaborated in stonework. The whole structure is restless in effect, and indeed fussy, yet despite this we must label the frontage as a fine one. It is interesting to compare this façade with that of the Saddlers' Hall block, lower down the street, but with that we will deal presently. The animal masks inserted in the bay-window interspaces provide variation, even if their *raison d'être* is not obvious.

The occupation of an "island" site produces at once an air of completeness and dignity, but such sites are rare in the old city; this insularity is the effect given to the site occupied in Cheapside by the Atlas Assurance Company, though in truth it is but a "peninsula"; the three façades are architectural and dignified, and in fact these premises provide one of the few really architectural buildings throughout this thoroughfare.

Nos. 97 to 99, a Gothic pile in brick, may be regarded as passable, though not admirable; there is a quiet effect, however, that satisfies us, and the corbelled-out brick cornice over all is a pleasant variation from what is customarily presented to the view. The solid heads to the semicircular headed windows of the first and second floors are sound, regarded from the aspect of fitting design, though this may be a refinement of ideas not appreciated by either the man-in-the-street or the average architect.

In Nos. 103 and 104 we observe a recently-erected block,

dating back, indeed, no further than 1906; it presents a free Renaissance stone elevation of six storeys, the lowest two being architecturally treated as one storey, and though arguments may be adduced in favour of such method of design, it cannot be accorded our personal benediction. To the superstructure is introduced a shallow oriel as a decorative feature, and over all is a lantern. The ornament is slight, good of its kind, and is well distributed. The panelled pilaster-shafts to the second and third storeys are satisfactory, but we shall never approve blocked columns, this treatment being altogether a subversion of the columnar idea.

No. 111, though lacking any definite architectural style, is undoubtedly meritorious; in truth, such a comment scarcely does justice to its merits, and this despite the fact that it is but a plain façade in stone with a shallow bay to the first and second storey, and with a gable over. And its neighbour, a Renaissance model, similarly avoids thrusting itself unduly upon our notice; the blue and grey Labradorite to the ground storey, with the superstructure in red Mansfield stone proves satisfactory, though Labradorite is no favourite of ours.

Passing by some blocks lacking in interest, and where interspersed we observe that abomination, the broken-based pediment, our attention is arrested outside the King's Hall Café, whose attraction consists in the pleasant recessed shop-front to the ground and first floors in its stone and grey granite frame. The adjoining wide-stretching Saddlers' Hall block (Nos. 137 to 145) merits notice, though it fails to satisfy our artistic cravings. For if the Mercers' Hall frontage is too fussy, this of the Saddlers' Hall is too monotonous, too anæmic even, and the weak repetition of the semicircular-headed windows to three storeys is irritating. The building dates from 1823, and is a stone-fronted Renaissance block, with five storeys above the footway. Notice may be taken of the poor appearance of "parti-treatment" of the façade, as effected by pigmental decoration, making Nos. 137 to 141 seem almost a distinct block from Nos. 142 to 145, the central entrance to the Hall (No. 141) seeming at the first glance to be at the side. A semicircular-planned balcony over this entrance and the dormer at the top of the building possess as ornament the coat of arms of the Worshipful Company of Saddlers; three saddles on the shield in chevron, with horses as supporters, and with the motto "Our trust in God"; neither Saddlers' nor Mercers' compare in architectural interest with the recently-erected frontage of Cordwainers' Hall in Cannon Street.

Turning our attention to the west side of Cheapside, the first building (No. 1) is one of those restless—nay, fussy—elevations, so strangely characteristic of modern architecture; we say "strangely," because the affectation of undue simplicity is perhaps equally characteristic. In this building there seems to be no fundamental design; it is more as if the architect had proceeded on an empirical basis, a voyage of discovery. And there is so much of it too—seven storeys; so that the eye cannot but encounter it. Nos. 2 and 3 are much better; equally tall and suffering pronouncedly from the disease of blocked-out window-architraves, the effect is very different from that produced by No. 1; it is, in fact, a quiet block that merits attention, with its symmetrical gabled flanks connected by the substantial entablature to the central portion, and the flat oriels running through three storeys of these flanks please us. The columnar treatment would be better if the end columns had been coupled. Mr. Delissa Joseph has designed in Nos. 4 and 5 a quiet and inoffensive, even if not an admirable, building; an entrance on a circular sweep is always apt to prove unsatisfactory, more particularly when a circular head to the doorway is provided. The kangaroo keystones were not, we believe, an original feature, but their later introduction, when the building was taken over by Australasia, is to be approved. The carving generally is passable, and the looped swags look well.

Very many of the blocks on the south side of the thoroughfare must be passed over unnoticed; not that their poverty is of necessity thereby implied, but the impossibility of scheduling all the buildings will be manifest. Before Nos. 46 and 47 we will, however, arrest our steps, as this is a very unusual frontage. Gothic in red brick, with sparse stone courses, and without dressings as usually understood, the façade pleases; the eastern portion of the south front rises two additional storeys in a gable, adorned with animals as acroteria, and the western elevation is also gabled. The arcaded treatment of the façade is nicely varied, and altogether this is a building which we can always regard with pleased interest. Its neighbour is also modern Gothic of the Early English style, over-ornamented, perhaps, but

certainly not to be passed by unnoticed, with its open arcading, its tile slopes and water-tables and its statues.

And then, disregarding one block, we will observe No. 50, which contrasts vividly with the one last noticed. Here we see free Roman Doric with bucrania and swags, the superstructure having Corinthian pilasters, embracing three storeys. An unusual feature is the alternation of vermiculated blocks to the lower portion. The Aerated Bread Company built the adjoining premises, and introduced its monogram on the façade; it is a good and quiet elevation.

Two works of Sir Christopher Wren's will claim attention in the course of this article, the first being the church of St. Mary-le-Bow (1680), a masterpiece of Art and all-compelling in the admiration it attracts. It is fine, graceful, dignified and picturesque, with the combined Gotho-Renaissance feeling that Wren introduced into much of his ecclesiastical work. The entrances in the tower on the south and west faces have Roman Doric treatment; the co-operation of Grinling Gibbons was never happier than in this church, where the cherubs' heads, the trails of fruit and the amorini are all delightful. If at times Wren's work depended for its effect upon Gibbons' contributions, it is not the case here, any more than at St. Paul's Cathedral; indeed, were there dependence in either building it would be more so at the cathedral than the church. The tower is finely proportioned, and is a good admixture of repetition and contrast; the portal stage is very lofty, and this is surmounted by clock belfry and stair stages, the spire being topped by the City dragon. The method of setting the actual entrances in a cavetto framing is effective, and the charming cherubs' heads in the metopæ is a most unusual feature and equally attractive.

No. 60 Cheapside provides a point of interest in the particular variety of treatment of the inset three-storey bay-windows with the rounded connection at the extreme angles. Sir John Bennett's premises merit notice by reason only of their singularity; the façade is poor, and so is the carving. What prove most attractive (though not most pleasing) are the hideous effigies of Gog and Magog, and what is most pleasing (though perhaps not most attractive to the public) is the fascia with its dark mosaic lettering on dull gold mosaic ground.

No. 73 is attributed to Sir Christopher Wren, but were this not the case we fear it would not arrest our gaze. It was built in 1669 for Sir William Turner, Lord Mayor; the best features are the main cornice and the carved surmount over the entrance, the ladies seated on the curved haunches of the pediment looking less uncomfortable than such a position warrants, through having their feet supported upon blocks at the base.

And after this, still strolling westwards, we see some of those designs which stand on the borderland between good and—we will not say "bad," but simply—not good; sufficiently uninteresting to induce our steps to wander westwards again beyond Peck's fine statue, until we enter Newgate Street.

Too soon—perhaps even before the appearance of this article—there will have disappeared from the public view one of the fine erections of the nineteenth century; we refer to Sir Robert Smirke's inspired block, the original St. Martin's-le-Grand, dating from 1829. It is in the Grecian Ionic style, so far as the "order" is concerned; a plain building, unrusticated and unadorned, save by the magnificent western portico, upon which and the well-studied proportions of the edifice the merits of the work depend. The Post Office block on the opposite side of St. Martin's-le-Grand and flanking on Newgate Street is more modern by nearly half-a-century, Mr. James Williams (of H.M. Office of Works) having been responsible for it in 1870-74; it is not of the same level of merit as the one previously described, and, as regards this quality, is indistinguishable from a large number of works, whereas Smirke has produced something unique, just as the Bank of England, the Natural History Museum, the Albert Hall, and Kensington Palace are unique of their respective kinds. But Mr. Williams' building is dignified and expressive, and gains in both dignity and expression by reason of the spare use of ornamentation.

Further westward in Newgate Street is the new General Post Office (King Edward's Building), the work of Sir Henry Tanner, official architect, and dating back to 1906. This has an interest all its own in modern construction, being one of the earliest examples (we believe, indeed, the earliest) in London of the use of reinforced concrete, the particular system employed being the Hennebique. This being so, it is obvious at once that we are confronted by a sham, a counterfeit stone-constructed, where it is in reality but a stone-faced building; and, consequently, the artistic interest

MODERN EUROPEAN ARCHITECTURE.
SPAIN.[From *Arquitectura y Construcción*.

DETAIL OF FACADE OF THE EAGLE HOUSE, BARCELONA.—Don JOSÉ PLANTADA, Architect.

attaching to the original is entirely lacking in the latest block. It is to be hoped that as time and tide move on they will bear on their bosom a considered artistic development of the new method of construction, even such as we are hoping that engineering will exhibit in time. As it is, Sir Henry Tanner has produced pleasing elevations both to Newgate and King Edward Streets (the latter, unlike the Post Office, named after King Edward VI., not King Edward VII.). The architect may be congratulated upon carrying on the traditional treatment for Post Office work, whilst adapting it to more modern conceptions.

If we desire to observe the negation of columnar design in full blast, let us regard Nos. 89 to 93 in Newgate Street, where the London City and Midland Bank premises sport in uncolumnar columns and also (incidentally) in broken-based pediments. The Elizabethan design of Nos. 115 to 117 is passable in its admixture of stone, brick and terra-cotta.

The Central London Railway (no longer, alas! the "Two-penny Tube"!) provides us in this thoroughfare with our first opportunity of comment upon its stations. The buff terra-cotta booking-halls and exits, which characterise the treatment on the Company's line, do not prove greatly attractive, though the desired object is doubtless satisfied commercially, and the station designs are quite respectable and

expressive. As regards the Post Office Station superstructure, the work of Mr. Delissa Joseph (one of London's busy commercial architects), this again is doubtless all that is required and desired, but it is quite uninspired.

For the most part the elevations on the south side of the thoroughfare are either poor or, at best, indifferent; but Nos. 2 to 5 provide a quaint modern façade that pleases with additional emphasis, by reason of its surroundings. The shop fascia treatment is unusually good, with its projecting cornice, and the decorative display of amorini holding swags is satisfactory.

We now confront the last building to be reviewed in this article—a building than which there is nothing superior in the procession of the centuries witnessed by us, though Bow Church of the seventeenth and St. Martin's-le-Grand of the early nineteenth are the compeers of the Central Criminal Court of the early twentieth century. The late Mr. Edward Mountford was just the man to produce such a design; he looked the part of a dignified Renaissance, even Classic, designer, and his work was ever thoughtful and dignified. In this building he was at his highest level; there are, it is true, defects both internal and external, but the external ones, at any rate, are so relatively unimportant when compared with the design as a whole, that we do not choose to

dwelt upon them. The proportions are good, the distribution of parts and of ornament is good, the carving is good; it is a pity that old Newgate Gaol (a building full of artistic interest) had to disappear, and there is some sentimental satisfaction in knowing that very many of its stones have been re-used in the new building. But as Newgate was doomed to follow where so many of its temporary tenants led the way, it is well that the present remarkable edifice should have risen, phoenix-like, to take its place and to carry on its architectural tradition.

VICTORIA AND ALBERT MUSEUM.

THE Department of Engraving, Illustration and Design of the Victoria and Albert Museum has recently acquired, by purchase, a large number of original studies by the late Frederick Shields, for his well-known illustrations to Bunyan's "Pilgrim's Progress." They have been mounted with the wood-engravings to which each group relates, and a selection of about ninety is now exhibited in Room 70. This series, with a set of drawings for Defoe's "Plague of London," some of which are now in the Manchester Art Gallery, constitute Shields' chief contribution to the great period of English book illustration, the "Sixties," and when published they received high praise from Rossetti and other artists, as well as from John Ruskin. The same room also contains two original pen-drawings by the late E. A. Abbey, R.A., for "She Stoops to Conquer" (1885) and "The Quiet Life" (1889), given to the museum by Mrs. Abbey in memory of the artist, as well as another study purchased for the collection, which is thus enriched with a representation of the work of one of the most distinguished of the pioneers of modern methods of illustration. Mr. Stanhope Forbes, R.A., has given eleven etchings by the late Mrs. Stanhope Forbes, whose graceful and accomplished work in this medium, belonging to the earlier period of her artistic career, is by no means as widely known as it deserves. Among other recent accessions, wholly or in part, now exhibited are four drawings by the late L. R. Garrido (1868-1909), given by Mrs. Garrido; a collection of twenty-one working proofs, &c., of etchings by the late David Law (1831-1902), given by Miss Law; two etchings by Mr. D. Y. Cameron, A.R.A., "Rameses II." and "The Lion and the Unicorn," given anonymously; and four studies by James Ward, R.A., given by Mr. A. E. Anderson. Four studies for "The Harvest Moon" and other pictures, by G. H. Mason, A.R.A., have been purchased, and are also shown.

IRON AND STEEL OF ANCIENT ORIGIN.*

SECTION A.—INTRODUCTION.

THE use of iron, including in this term the combination of iron and carbon known as steel such as produced by the fusion or cementation processes, has, without doubt, existed from a time dating back to a very early period in the world's recorded history.

Owing, however, to the avidity of the oxygen present in the air for this metal, it has been most difficult to obtain ancient specimens of iron. We have, therefore, but little definite evidence regarding its early manufacture and use.

We who live in this modern Western world are apt to pride ourselves that we have all the knowledge on this subject of metallurgy, but the facts presented in this paper show this assumption to be incorrect. Whilst information available from the East regarding iron of ancient production is fragmentary, yet undoubtedly a comparatively high state of metallurgical art and knowledge must have prevailed not only centuries, but more than a thousand years ago.

The term "Sinhalese" is explained as follows by Dr. S. M. Burrows, M.A., in his book "Buried Cities of Ceylon": "In B.C. 543, Wijiyo and his Sinhalese followers landed in Ceylon, possibly near the modern Puttalam on the west coast. He is said to have been the discarded son of one of the petty princes in the valley of the Ganges, while the native chronicles explain the name of his race by tracing his paternity to a lion—'Sinha.'"

This is not the first paper which has been read on this subject. One hundred and seventeen years ago—to be exact, on June 11, 1795—Dr. George Pearson, a Fellow of the Royal Society, read a paper entitled "Experiments and

Observations to Investigate the Nature of a Kind of Steel, manufactured at Bombay, and there called Wootz, with Remarks on the Properties and Composition of the different States of Iron."

It was the author's good fortune during his recent tour round the world to visit the Colombo Museum and inspect a set of ancient specimens of iron and steel which were obtained from some of the buried cities of Ceylon. These cities date back from about 500 B.C., and since then have had a more or less continuous history as habitable by human beings; the history of some of them continued up to about 1500 A.D.

This collection, which was formed quite recently, and has not been previously known or described, was lighted upon quite by chance, and was the find of an otherwise idle day. It is a fascinating collection of ancient specimens and instruments of iron, and is in many respects absolutely unique.

Not only does the Colombo Museum contain this large number of interesting specimens of ancient tools and implements of various kinds—some 250 in number—but in another section of its exhibits are shown several swords of more modern date, bearing the dates of the years 1374 and 1416 A.D., with Sinhalese legends inscribed upon them.

To those interested in the metallurgy of iron and steel, this collection of ancient iron and steel specimens appeals as being without doubt the most complete and unique in the world. There is probably nothing at all like or approaching it in any other museum or private collection.

Whilst there is often an impression that the use of iron, including in this term the alloy of iron and carbon known as steel, is a modern development, this is probably incorrect, as without doubt such knowledge really dates back to the earliest stages of tradition. For several reasons it has been difficult to obtain ancient specimens of this material, more particularly in the form of steel. It is for this reason that the Sinhalese specimens in question are so valuable, for there exists but little definite evidence as to the period when iron and steel were first employed by man.

There is a reference in the report of the Director of the Colombo Museum to the fact that iron implements are very liable to rust even in the atmosphere of Ceylon, with its constant high temperature, and even after having been cleaned and impregnated with paraffin wax by Krefling's methods. Rust preservatives are, therefore, used in the museum from time to time as rust appears; the simplest way has been found to give the specimens a coat of the above varnish.

The importance of this subject was recognised by Dr. A. Willey, F.R.S., the Director at the time of the author's visit to Ceylon, and in his annual report he expressed the hope that more of the long steel stone-cutting chisels would be found during the course of the archaeological survey operations, so that further examination could be made. It was also stated in the report that the ancient Indian method of making steel in clay crucibles seems to be identical with the method thought to have been invented in England in the middle of the eighteenth century.

Another reason which caused the author as a metallurgist to be specially interested in these Sinhalese specimens was that during his tour in the East he first visited Egypt, and an inspection there of the wonderful works in stone raised questions in his mind as to the method and tools with which these memorials in stone were hewn to shape.

It has been asserted that the Egyptians knew how to harden copper so that it could be made to take and keep a cutting edge under the severe working stresses to which the tool must have been subjected in order to produce the hundreds of thousands of forms now to be seen in the Nile Valley from Cairo to Khartoum or beyond, over a distance of some 2,000 miles. Such work must have involved the labours of immense numbers of stonemasons, who would require tools. The author is strongly of opinion that no method of hardening copper was then known which would produce tools having a hard cutting edge, or which were at any rate at the same time tough enough to stand the severe impact blows such as stone-cutting work required. Copper alloyed with other elements can be hardened, and it is said that a turning tool has been made which had cut iron. The author is of opinion, however, that such a material made up into chisels, wedges, and the like would be of little value for hewing to shape and finishing the gigantic works in stone of the Egyptians.

It is far more probable that the ancient Egyptians were not only able to make steel for tools of all kinds, but also to cement and harden it, or, if they were not themselves steel-

* Abstract of a Paper by Sir Robert Hadfield, F.R.S. (Sheffield), entitled "Sinhalese Iron and Steel of Ancient Origin," read before the Iron and Steel Institute at the annual meeting.

MODERN EUROPEAN ARCHITECTURE.
NORWAY.[From *Arkitektur og Dekorativ Kunst*.

FIRST PREMIATED DESIGN FOR NEW POST OFFICE, CHRISTIANIA.—Mr. OLAF NORDHAGEN, Architect.

workers, they obtained the necessary material and help from the workmen of another nation. There is, indeed, evidence that such was the case, and the facts available suggest that in the art of steel-making Egypt received assistance from India or China. There are, it is true, but few specimens of iron or steel tools or implements in and from Egypt. There is, however, a scythe of iron in the British Museum; examination shows it to be in such an oxidised condition that it is not possible to say definitely what is the nature of the material, although it is undoubtedly iron. This scythe, which the author has seen and handled, is so thin and corroded that it would almost fall to pieces unless most carefully dealt with. There is also an important specimen of iron taken from the Great Pyramid. In determining this general question as to the use of steel by the Egyptians, it should be remembered that there are several ways of endowing iron with the quality of hardening—that is, after heating and quenching it in water, or other cooling medium.

As before mentioned, the specimens in the Colombo Museum were taken from the ruins of some of the buried cities of Ceylon.

The names of the buried cities in question are Anuradhapura, 437 B.C.-769 A.D.; Polonnaruwa, 769 A.D.-1319 A.D.; and Sigiriya, 479 A.D.

Whilst the Sinhalese temples and monuments are of much later date than those of Egypt, nevertheless, in view of the metallurgical knowledge which was evidently possessed at a very early period in India and later in Ceylon, it is quite evident that the knowledge then prevailing in these matters must have been considerable. There is no evidence that the metallurgy of iron was understood in Egypt; it seems more than likely, therefore, that, as has been suggested by several authorities, aid was obtained by the Egyptians from the Far East—no doubt India or China, whence there was a constant stream of trade and commerce. They were thus enabled to carry out their many wonderful works in stone, including temples, pyramids, statues, obelisks, sarcophagi, sculptured walls, figures, tombs, steles, and the like, many of them prepared from the intensely hard

Assouan granite, also red and black granite, quartz, porphyry, limestone, and sandstone. Some of the hieroglyphics have been found cut to a depth of no less than 2 inches. To carry out such work would require tools of excellent quality.

At Colombo there are several hundreds of these ancient iron specimens. They comprise large and small chisels, including stone-cutting chisels, about 2½ inches in length and ½-inch in diameter, axes, adzes, hoes, wedges, scissors, locks, keys, and many other articles. As regards the age of the specimens, Dr. Willey, F.R.S., the Director of the museum, states that this is vouched for by those thoroughly competent to make the statement and that the specimens are 1,200 to 1,800 years old. They are in a remarkably good state of preservation, and many of them, being quite bulky, offer much better scope for examination than anything of the kind the author has ever seen or heard of.

When considering the origin and nature of these specimens, it should be borne in mind that the "Veddars," the aboriginal hunting caste or hill tribe of Ceylon, were of very poor intellect, and it is extremely doubtful whether the high order of knowledge necessary to produce steel, and particularly steel by the crucible process, could have been possessed by them.

Ceylon, is, however, from the ethnological point of view, practically an integral part of India. The distance between the two countries is so small that it is shortly to be spanned by rail. There seem, therefore, good grounds for the assumption that the requisite skill and knowledge required for steel-making probably reached Ceylon from India.

(To be continued.)

OUR CONTEMPORARIES FROM OVERSEAS.

The *American Architect* (New York) publishes a report in part of a speech delivered in the United States Senate by the Hon. Francis G. Newlands, of Nevada, the gist of which is that the cost of preparing plans and specifications for new buildings in the Government architect's office is 6.02 per cent. on the cost of the buildings, or more than the 6 per cent.

which is now the recognised charge for architects in private practice, who for that charge include superintendence during the erection, whereas the expense of the Government's official staff does not include any cost of superintendence. Illustrations in our contemporary include residence and gardens for Robert Saltonstall, Esq., at Milton, Mass., by Messrs. Bigelow & Wadsworth, and a variety of domestic work by Messrs. Duhring, Okie & Ziegler.

Der Architekt (Vienna) contains designs for dwelling-houses and shops at Wels, a Rathaus at Rottenmann, a synagogue at Ofner, an evangelical church at Vienna, and the stage scenery for Shaw's "Cæsar and Cleopatra" at the Hofburg Theatre, Vienna.

Arquitectura y Construcción (Barcelona) illustrates houses in a garden suburb at Villanueva, near Barcelona.

Bauwelt (Berlin) shows "How (German) architects build their own homes" by views of the houses designed for themselves by seven different architects.

La Construction Moderne (Paris) illustrates some more examples of Parisian façades premiated in 1911.

Deutsche Bauzeitung (Berlin) gives further illustrations of the Hamburg overhead railway; competition designs for a garden and art exhibition in the grounds of the Festhalle at Frankfurt-on-Main; the two new Royal Court theatres at Stuttgart.

The Pacific Coast Architect (Portland, Oregon) shows once again that good architecture in the States is not confined to the east. Multnomah County Court House, by Messrs. Whidden & Lewis, of Portland, Oregon, is an admirable Classic Greek design, and a house at Portland by Mr. Wade H. Pipes is a charming cottage.

Stone (New York) has some good bits of detail of fourteenth-century work at Messina, and an interesting illustrated article on colossal statuary.

The Western Architect (Minneapolis) has a full series of illustrations of the first premiated design for the Commonwealth of Australia Federal Capital competition, and also of other works by the prizeman, Mr. Walter Burley Griffin.

NOTES ON BOOKS.

"The Preparation and Uses of White Zinc Paints." By Paul Fleury. Translated from the French by Donald Grant. With thirty-two tables. (London: Scott, Greenwood & Son. 6s. net.)

As it is quite within the bounds of possibility that we shall before long be legally forbidden to use white lead as a basis for paint, it is desirable that we should have the opportunity of learning the capabilities of white zinc and the special points that have to be taken into consideration in order that it may be satisfactorily used as a basis for general painting.

There can be no doubt that white zinc has many excellent qualities of its own, but at the same time it is also certain that it requires its own appropriate treatment, and that the painter who has been used all his life to the handling of white lead has something fresh to learn when he has to substitute white zinc. As by the French Act of July 20, 1909, the use of white lead has been interdicted in all paint work of buildings, it is natural that careful consideration has been given in France to the important points relating to white zinc, and in the work before us by M. Paul Fleury we have well explained the differences both in the proportioning of material and in the handling that are necessary when white zinc has been adopted as the basis of paint, for, as the author points out, the technique of laying on paint differs with white zinc from that which the painter is accustomed to use with white lead.

Interesting chapters in the book are those dealing with the experience of the Dutch Commission officially appointed to make comparative trials between white lead and white zinc and the author's criticisms of these experiments.

The value of M. Fleury's work is enhanced by critical notes by his translator, Mr. Donald Grant, particularly with respect to the author's chapter on the analysis of paint.

COMPETITION NEWS.

CANADA.—The first place in the competition for designs for the proposed Legislative and Executive Building at Winnipeg has been awarded to Mr. F. W. Simon, F.R.I.B.A., of Liverpool. The cost of the work was estimated by the promoters to be £400,000, exclusive of heating, lighting, plumbing, &c.; and a fine open site of about 1,000 square feet has been set aside for the building. The competition, which was open to all architects practising in the British Empire who were British subjects, was in two

stages, and Mr. Leonard Stokes, President of the R.I.B.A., acted as assessor. After the preliminary competition the following five architects were invited to take part in the second stage, and received an honorarium of 2,000 dollars each: Mr. F. W. Simon, F.R.I.B.A., Messrs. E. & W. S. Maxwell (Montreal), Messrs. Sharp & Murray (Toronto), Messrs. Brown & Valland (Montreal), and Messrs. Clemsha & Portnall (Regina, Sask.).

CARLISLE.—The Carlisle Education Committee have adopted a recommendation that local architects who have been practising in the city since January 1, 1912, should be invited to submit competitive designs for a proposed school at Newton to accommodate 400 children. The premiums offered are £75, £30, and £20. The Royal Institute of British Architects will be invited to nominate an assessor.

GOOLE.—Mr. C. B. Flockton, F.R.I.B.A., of Messrs. Flockton & Gibbs, of Sheffield, has been appointed assessor of the competitive designs submitted for the proposed municipal offices at Goole. The designs were sent in on September 1.

MACCLESFIELD.—The committee of the Conservative Club have awarded the first premium of £50 offered for designs for new premises to Mr. J. E. Burgess, Cumberland Street, Macclesfield. The second premium of £25 goes to Messrs. Hall & Fawcner, Macclesfield, and the third of £25 to Messrs. Woodhouse & Dean, Manchester. The assessor in this competition was Mr. G. K. Keighley, of Burnley.

WALES.—The Llandudno Council, at their monthly meeting, confirmed the decision arrived at in committee to offer a prize of 50 guineas for the best design for the laying out of the portion of the Happy Valley recently presented to the town by Lord Mostyn, together with the "Wyddfyd" property at the top of the valley which the Council purchased a year ago.

WORCESTER.—The Education Committee on Monday last decided to invite competitive designs for a Council School to accommodate 750 scholars, to be erected on the site of the skating rink in the Arboretum. The competition will be limited to Worcestershire architects, and Mr. H. T. Buckland, Lic.R.I.B.A., of Birmingham, will act as assessor.

WE are glad to hear that the Lords of his Majesty's Treasury have appointed a committee to consider the question of modifying or maintaining the lines of Mr. Norman Shaw's Regent Street façade of the Piccadilly Hotel in completing the rebuilding of the Quadrant, Regent Street. The members of the committee are:—The Earl of Plymouth, C.B. (chairman); Sir Henry Tanner, C.B., I.S.O.; Mr. Reginald Blomfield, A.R.A., president, Royal Institute of British Architects; and Mr. John Murray, F.R.I.B.A. The secretary to the committee is Mr. Walter Fidler, of his Majesty's Office of Woods and Forests, 1 Whitehall, S.W.

Intercepting Traps.

SIR,—I have just been reading your interesting leader on this subject, and hope shortly to try and absorb what the Departmental Committee has issued in its report.

Personally, I am one of the stalwarts in favour not only of retention of the interceptor, but also of a non-diminution of its diameter.

Quite recently I have had most valuable and direct testimony as to the intimate connection between a trapped-off sewer and the consequent barrage of rats from the house drains. The rodents were making a free run up the house system (their paw marks being evident in the different chambers), and on examination it was discovered that the sealing-off cap to the cleaning-eye of the disconnector was absent. This defect being remedied, the rats, previously frequent visitors, have not since been seen at all.

I think the idea of diminishing the sectional area of the trap is deplorable; for when we remember the carelessness of the average householder and serving-maid, we need to give every facility for scrubbing brushes, clothes pegs, and other household requisites to pass freely into the sewer.

We live in mad times, but I had not expected quite such an exhibition of madness as this in connection with disconnections.—Faithfully yours,

PERCY L. MARKS.

FORTHCOMING EVENTS.

Monday, October 7.

Society of Engineers : Paper on "Town Planning from an Engineering Aspect." by Mr. E. R. Mathews, A.M.Inst.C.E., F.G.S., at the Institution of Electrical Engineers, at 7.30 P.M.

Wednesday, October 9.

Manchester Society of Architects : Presidential Address by Mr. John Brooke, F.R.I.B.A., at the Society's Rooms, at 6.30 P.M.

Thursday, October 10.

London University : Course of Lectures on "French Renaissance Architecture by Mr. W. H. Ward, M.A., F.R.I.B.A., at University College, London, at 6 P.M. (1) "Introductory. The Renaissance in Italy and other Countries."

Friday, October 11.

Institution of Municipal Engineers : Annual General Meeting at 4 Southampton Buildings, W.C. (two days).

REGENT STREET QUADRANT.

As we mentioned last week, we are glad that a committee has been appointed to consider the design which is to be adopted in completing the rebuilding of Regent Street Quadrant, already commenced by the erection of the Piccadilly Hotel, with a façade designed by Mr. R. Norman Shaw, R.A.

The genesis of the committee is, of course, due to dissatisfaction that has been expressed with Mr. Norman Shaw's design. It is admitted even by those who are dissatisfied that the Regent Street front of the Piccadilly Hotel is a masterly piece of architectural composition, but it is objected that there is too much stone and too little plate glass for proper display in shop windows and for the exercise of the art of window-dressing by tradesmen who wish to attract customers.

We think that this objection on the part of businessmen is chiefly the result of a misconception based on the conditions and method of shop treatment to which they have become accustomed.

The shopkeepers of the eighteenth century did not find it necessary to expose a large expanse of their goods to the passers-by in order to attract custom, and still they managed many of them to acquire fortunes in trade. The modern window-dresser has become accustomed to exercise his art on a large surface, and he has come to believe that it is only when he has a large canvas in front of him that he can draw an attractive picture. But because the genius of one painter demands a surface of great area for its free exposition it does not follow that there is no room for beauty in a miniature. Indeed, we may go further than this and say that it is highly probable that the shopping public has become *blasé* in the matter of plate glass and unrestricted display of goods, and that it might, from a financial point of view, be better business for a shopkeeper to adopt a gem-like treatment in his window dressing, and allow his gems the advantage of an appropriate architectural framing. There is plain evidence in the frantic attempts made by window-dressers to introduce new and startling effects that the unrestricted expanse of plate-glass is not so potent in arresting attention as shopkeepers have been educated to believe.

Extensive display invariably diminishes the preciousness of the things displayed. A plateful of diamonds or emeralds or pearls has little beauty, still less a mixed plateful. A single diamond in a fine setting is worth, from the point of view of beauty, all the stones of Kimberley in a heap. Extensive display is characteristic only of barbarism.

There is another point about the display of goods which we think has been overlooked by shopkeepers—

the principle that the half-revealed excites curiosity and arrests attention far more than a full display. And it would be a policy worth trying to attract people into a shop by a suggestion of other and even better things inside, rather than, by putting everything into the front window, or at any rate seeming to do so, to give a possible customer a chance of having a look and passing on. Thus we are inclined to think that, even from a business point of view, the treatment of the Regent Street front of the Piccadilly Hotel is sound. We do not believe that the shop windows at present occupied in that front are unattractive, nor that they are less likely to catch a chance customer than the square yards of plate-glass which are found in other Regent Street frontages.

We cannot, of course, forecast what may be the decision of the committee appointed to consider the question of the design, but it may at least be predicated that the eminent architects constituting that committee will have due regard to the financial interests of the Crown and its tenants, as well as to the claims of the art of architecture, and we say this because they are eminent architects—that is, they are the right combination of artist and business man.

From a general point of view, the whole incident is one more deplorable example of the incapacity of our authorities, as at present constituted, to deal satisfactorily with the architecture of our London streets.

Regent Street and Piccadilly seem likely to be added to the roll of thoroughfares which, like Kingsway, have started with good intentions for dignified and harmonious architectural treatment, and ended in our characteristic English fashion in a patchwork of charming but incongruous bits.

When the subject of the rebuilding of Regent Street was discussed in the House of Lords some seven years ago promises were made of a continuity of architectural treatment, and a design for the whole frontage was, as our readers are aware, prepared by Mr. Norman Shaw. Now Mr. Shaw's design is in danger of being mutilated both in Regent Street and in Piccadilly. So with Kingsway; a competition between a number of eminent architects was held, and a design was selected as the best. But in neither case have the authorities been strong enough to carry through a scheme of continuous architectural design in the face of the opposition of tenants and owners of property. It is a question open to discussion and difference of opinion as to whether it is after all desirable that the architecture of a street should have an uniform character. There are, no doubt, artistic qualities which can be obtained by such uniformity, and in no other way. On the other hand, there are artistic

OWAIN GLYNDWR'S PARLIAMENT HOUSE.—VIEW OF NEW BUILDING FROM ROAD.

qualities which are not necessarily produced by such uniformity, and may even be destroyed by it.

Thus there may be a legitimate difference of opinion and of taste as to which of those qualities are to be allowed to predominate, but it is high time that Englishmen made up their minds as to whether in any particular instance a street is or is not to be endued with an uniform character of design. It is simply making ourselves ridiculous to start a design intended to be carried throughout a whole thoroughfare and then to fail in its accomplishment because before it was adopted sufficient attention has not been given to the circumstances. To attain uniformity of character in the design of a thoroughfare all the requirements, and even the whims, of those with vested interests in the various properties must be considered and co-ordinated before a design is made to which the different owners and tenants may be expected or constrained to conform. The Piccadilly front of the Hotel was designed on a definite understanding that its design would be completed on adjoining property, but apparently without regard to the exigencies of that property. Now it is a pig with one ear, and seems likely to remain so, a monument of English stupidity and muddle.

We badly need an authority who will take charge of the architecture of our streets, an authority possessed of sufficient intelligence, ability, and foresight to make a wise decision as to what can and what cannot be done before any scheme is approved and started; and this authority must not only be wise but powerful, and able to enforce its decisions. At present we seem to get nothing but unwise decisions incapable of being enforced. The London County Council found themselves unable to maintain a uniformity of character of design in Kingsway, and even the Crown, with all its power, appears to be dubious as to the possibility of carrying through a scheme of which its present and prospective tenants disapprove, no matter whether the disapproval is founded on good grounds or not.

NOTES AND COMMENTS.

THE trouble at Philæ is but one more illustration of the struggle that is ever going on between the useful and the beautiful. It is vain to expect in these days, or indeed in any days, that the benefits to a country such as those which will ensue by the raising of the dam at Assouan will be considered by the general public to be outweighed in importance by the claims of such a historical monu-

ment as the Philæ temple, no matter that the temple may possess artistic qualities in its painted decoration or unique character. However much we personally may regret the loss of such precious remains, we cannot but admit that in all periods of the world's history the art of the past has had to go when it stood in the way of either the art or the material needs of the present.

The Greeks pulled down old temples to build newer and better ones, the Romans followed their example, and the men of the fourteenth and fifteenth centuries destroyed the work of the thirteenth and fourteenth to make room for their own. All that we can do, therefore, at the present day, is to see that no ancient monuments are destroyed unnecessarily, but we must be prepared to admit that there are occasions on which such destruction is necessary. We must also be prepared to show that what we desire to be preserved is worthy of preservation at the cost which such preservation will involve. It is difficult to see how such conditions are to be complied with in the case of Philæ. Its setting is undoubtedly incapable of preservation, and it is difficult to specify how the temple itself, and particularly the painted decorations, are to be preserved if the dam is to be raised. Therefore we fear, much as we regret it, that Philæ must go.

A long report of a special meeting of the Pembroke Urban District Council is given by the *Irish Times*, which illustrates very clearly some of the difficulties that attend the provision of housing accommodation by local authorities. No matter what scheme is brought forward there seems always to be a certainty of opposition. In this case the scheme seems to have been carefully prepared, providing for the erection of 295 houses at rentals of 4s. 3d., 4s. 6d., 4s. 9d., 6s. 9d., and 10s. a week, and according to the chairman the scheme would involve an expenditure of £60,000, and would pay for itself and not cost the ratepayers one farthing, inasmuch as the rents receivable by the Council for the houses would more than cover all the outlay and all the annual expenses. The Council seems to have been particularly fortunately placed by the generous assistance of Lord Pembroke, who is giving towards the cost of the housing schemes one-half of the compensation to which his lordship would be entitled as ground landlord of all the property the Council is taking over. Of course, there

OWAIN GLYNDWR'S PARLIAMENT HOUSE.—FRONT VIEW OF OLD PARLIAMENT HOUSE, BEFORE RESTORATION.

was an opposition who asserted that the scheme would not be self-supporting, and also that the houses ought to be let at a lower rent. These objections must always be the Scylla and Charybdis of municipal housing schemes. On the one hand the schemes must avoid the erection of houses at rentals which the tenants cannot afford to pay. On the other, they must steer clear of the necessity of imposing burdens upon the ratepayers, in order to make their finance possible.

The report for the past year of the Leeds Corporation Improvement Committee makes it clear why that city has apparently lagged behind in taking up the Town Planning question. A tabulated statement in the report shows that between 1893 and 1902 there were built in Leeds 22,776 houses; from 1903 to the present year only 14,014 have been built. According to the report the increase in the population during the last decade was 16,600. It is obvious, therefore, that the provision of house accommodation has been in excess of the increase of population.

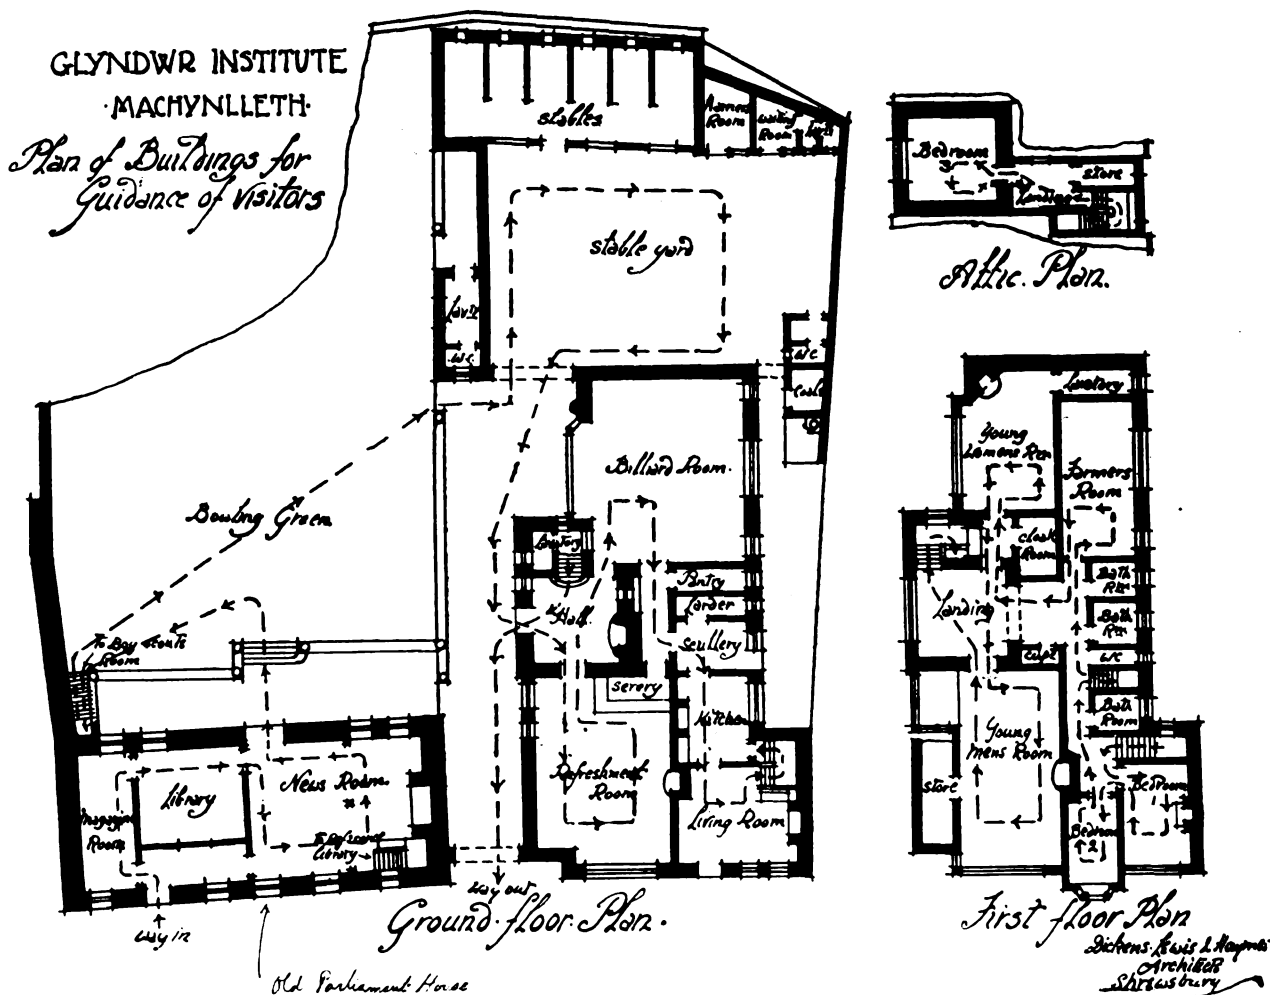

Adversity is not always without its benefits, and the depression in the slate trade, which in company with all building industries has been suffering of late, has stirred up the Carnarvonshire County Council to consider in what way the Government can assist in developing the Celgwyn Mountain district. A statement was made at a meeting that by running a tunnel through the mountain and spending £2,000 annually upon pumping water from the quarries, these would be able to work successfully instead of closing down.

A lamentation appears in the *Surrey Advertiser* that Pewley Down, a height immediately above the town of Guildford, is apparently doomed to pass into the hands of the builder. Once again we have here the conflict

between beauty and utility. Indeed, it necessarily follows that the development of the Garden City and Garden Suburb movement must result in alteration and sometimes spoliation of the natural beauty of the country side. If we are all going to have big gardens and the other amenities of the Garden Suburb, many of the charms of the country must go; trees must be cut down, downs and meadows turned into building land.

With regard to Pewley Down, tentative proposals have twice been put forward for the inclusion of this piece of ground as a public resort, but the reception these efforts met with does not encourage another attempt; in other words, the people of Guildford do not think that the beauty of Pewley Down is worth the cost of preservation.

At the annual meeting of the Birmingham Central Literary Association, Mr. Arthur Harrison, the retiring president, in his valedictory address spoke pessimistically, and confessed that Birmingham was not a beautiful city, and of course he fell foul of the plate-glass shop front, which he took for granted prevented street architecture from being beautiful. This, of course, is an open question and a problem of the present day, which if it has not yet been solved is not necessarily beyond solution. It is on the one hand quite open to question whether the exigencies of trade do make it imperative that buildings should have the appearance of standing upon plate glass as Mr. Harrison suggests, but if large plate-glass windows are a necessity, it is the duty of architecture as a living art to provide plate-glass windows in a beautiful building. If architects say that they cannot make a beautiful building with big plate-glass windows, they are merely confessing their own weakness and denying the function of architecture, which is to combine utility with beauty in building.

OWAIN GLYNDWR'S PARLIAMENT HOUSE AT MACHYNLLETH.

By the Rev. Professor E. TYRRELL GREEN.

BORN in 1359, by the opening years of the fifteenth century Owain Glyndwr from a guerilla leader had become an organiser and a statesman. He was virtually ruler of Wales, and during his successful years made Machynlleth his capital. Here he summoned a great Parliament in 1404, and a persistent tradition points out the house where this assembly met, the first and almost the only approach to a Parliament ever held in Wales. Before the delegates in conclave were laid Owain's proposals for maintaining the independence of Wales, and steps such as alliance with France discussed. It may be, too, that some of Glyndwr's great ideals for his country were ventilated at this same time; the establishment of Universities—one for the North and one for the South—and the freeing of the Church in Wales from the irksome and alien domination of Canterbury by the erection of a Province under an Archbishop who should rule from the throne of Dewi Sant at Mynyw. Glyndwr was a man before his time indeed. The University he planned is at last an accomplished fact, after the lapse of nigh 500 years. The Church yet waits for her independence that she may be the Church of Wales rather than the Church of England in Wales. But great questions with far-reaching consequences were then, as now, not discussed without heat, and during the Parliament session it was that an attempt was made upon Owain's life by Sir David Gam, of red hair and crooked eye, an adherent of the English king, and the original, it is said, of Shakespeare's character of Fluellen.

The building known as the Parliament House in Glyndwr's ancient capital was until this year in a very dilapidated condition. Externally it showed, even to the casual observer, signs of great age, but possessed little attraction, being of a plain and barn-like appearance, built of the slate stone of the district. There was very little remaining as an index of the original features of the building with the exception of the oak principals in the roof, all of which, with two or three exceptions, were in an advanced state of decay. After having been long divided up so as to serve for mean and gloomy-looking dwellings, this ancient hall has, by the generosity of that patriotic Welshman and munificent benefactor, Mr. David Davies, M.P., of Llandinam, been

restored, beautified and added to, and then by him handed over to the town of Machynlleth as the Owain Glyndwr Institute, that it may once more take its place as a public building of Wales, and serve the life of the people.

When the work of restoring this interesting relic of a great past was taken in hand, extensive search was made amongst MSS. and old prints for evidence as to the former appearance of the building. Living authorities in the antiquarian line likely to possess a knowledge of the structure were also consulted. But inquiries in these directions produced very little result. No prints or drawings appear to be extant showing the original appearance, and notices of the building even in so careful a publication as the "Archæologia Cambrensis" were found to be misleading and full of errors.

Owain Glyndwr's Parliament House now forms part of an imposing range of buildings, and is utilised as a news-room, lending library, and magazine-room on the ground floor. At the end of the news-room is an oak staircase leading to a reference-room, which covers half the area of the news-room below. The other half is open from ground floor to roof, according to the original arrangement. Above the magazine-room is a chamber, which is to be reserved as a Boy Scouts' room; this is approached by an external stone staircase, again according to the original plan, traces of the old stone steps having been left.

From the lending library, which occupies the central portion of the ground floor, one has an excellent view of the principals of the roof, with the oak rafters and braces, which have been restored exactly as they must have appeared in Owain Glyndwr's time. Upon the demolition of dividing walls and other parts added when the building was converted into dwelling-houses, a certain amount of ancient material was brought to light. Upon a careful comparison of such fragments with the existing structure it was fortunately found possible to reconstruct the Parliament House in a form closely approximating to its original one, and the building has thus, through Mr. David Davies' thoughtful generosity, been preserved with but little change through the vicissitudes of five centuries, and in spite of the vandalism brought to bear upon it in comparatively recent times.

In this historic building the antiquary is presented with some features of great interest. The roof is a good example of the work of the time, being of typical early fifteenth-century construction; and although, of course, it is much

plainer and ruder in form, it belongs to the same age which gave us the splendid example at Westminster Hall. Many roofs of the kind must have been erected in the domestic buildings of Wales at that period, but, unfortunately, very few now remain.

structed, having the hazel twigs interwoven with upright pieces let into the oak framing. The same method has been followed in the restoration, and two of the panels have been left exposed, to show the method of construction. Since the formal opening of the building, two of the plaster panels

NEW BUILDINGS.—VIEW OF ENTRANCE HALL.

Particular interest attaches to the way in which the room has been partitioned off. The centre part, now used as the lending library, was doubtless the Parliament or Council Chamber. The present magazine-room was probably a retiring-room, and the part now occupied by the news-room,

have been decorated with paintings of scenes from the life of Glyndwr, which may be regarded as typical of his work for Wales.

The new building contiguous to the old Parliament House has been designed in character with the old; in fact, the

INTERIOR VIEW OF OLD PARLIAMENT HOUSE AFTER RESTORATION.

having a large open fireplace at the end, together with the reference-room over it, were rooms for the retainers of the Court. The internal partitions were constructed of exposed oak framing filled in with plaster panels, and it is interesting to note the way the "lathing" for the plaster was con-

front wall, which has been preserved, is of contemporary date, and probably formed part of the Court stables; it is joined to the Parliament House by a large stone arch with double entrance doors.

The new building is to be used for the purposes of an

VIEW ON FIRST-FLOOR LANDING, SHOWING OLD "TOLL TABLE" REFINED IN WALL.

institute, and comprises, on the ground floor, a large refreshment-room, billiard-room, and caretaker's quarters. On the first floor, which is approached by a stone staircase, is a large panelled committee-room or young men's room, a girls' meeting-room, and a room for the use of the Director of Agriculture. Bathrooms are also provided.

At the rear is spacious stable accommodation, with waiting-rooms, &c., for the use of farmers.

The large space at the back of the Parliament House has been made into a bowling green, and from this point the finest view is obtained of the whole range of buildings, which, grouped round the courtyard overlooked by a massive square tower, present a most picturesque and antique tout-ensemble.

The whole of the work has been carried out by Mr. E. E. Jenkins, contractor, Aberystwyth, from the designs and under the superintendence of Messrs. Dickens-Lewis & Haynes, architects, of Aberystwyth and Shrewsbury, to whom the greatest praise is due for a most careful piece of restoration and reconstruction, coupled with a very clever design of new buildings in harmony with the old. Everything has been done to preserve the mediæval character of this historic structure.

ECCLESIASTICAL ARCHITECTURE IN CENTRAL ITALY.

By T. FRANCIS BUMPUS.

Author of "The Cathedrals and Churches of Northern Italy," "The Cathedrals of England and Wales," "London Churches, Ancient and Modern," "The Cathedrals of Northern France," &c.

IV.—FACADES.—DOORWAYS.—CAMPANILI.—DOMES.

(Continued from last week.)

THE celebrated circular Leaning Tower at Pisa was constructed by Bonanus, probably an Italian, and Wilhelm of Innsbruck, a German. It harmonises perfectly with the cathedral and the baptistery, the three buildings, which stand in dignified seclusion at the north end of the city, forming a group perhaps unparalleled for beauty in Southern Europe. The lowest storey is formed of blind arcades and half columns similar to those in the façade of the cathedral, whilst the seven upper divisions are open arcades with isolated columns, running up to a height of about 142 feet. The style is pure Romanesque, simple and very elegant in all its details. The deviation from the vertical line of about 12 feet was, in the opinion of some, caused by a careless

INTERIOR OF OLD PARLIAMENT HOUSE, MACHYNLLETH, BEFORE RESTORATION, LOOKING EAST.

INTERIOR VIEW OF OLD PARLIAMENT HOUSE, MACHYNLLETH, BEFORE RESTORATION, LOOKING WEST.

construction of the foundation, and was afterwards adhered to in order to prove what technical skill could do. This peculiarity cannot be excused, being contrary to all æsthetic laws; and though we may admire the ingenuity of the architects in having applied certain laws of gravitation, no architect should be advised to imitate such mechanical "tours de force."

It is now a pretty well-ascertained fact that the peculiarity of this Leaning Tower at Pisa is the effect of accident, and not of design; in fact, the west front of the cathedral and several of the columns are also out of the perpendicular, and the high altar, a late Renaissance structure, had settled down so much at one end that it was found necessary to take it down and re-erect it in 1825.

It is evident from the spongy nature of the soil that the leaning took place long before the completion of the tower, because the upper storeys have their columns longer on one side than the other, and the top storey of all, a later addition, is built upright. The upper storeys, also, are set back more on the inner than the outer sides, all which points to the fact that the builders were desirous of remedying the defect.

Though the walls of this celebrated structure are 13 feet thick at the base, and about half as much at the top, they are constructed throughout of marble. The entire height is 183 feet, but the ascent is easy by a stair in the walls, and the visitor hardly perceives the inclination till he reaches the top, and from the lower edge of the gallery looks "down" along the shaft receding to the base. There are seven bells in this campanile, so arranged that the heavier metal may counteract the leaning. One of them, called Pasquaveccia, was tolled when criminals were taken to execution.

The campanile of Siena Cathedral rises from out of the body of that structure on the western side of the south transept. It is square, and coursed equally in black and white marble; the pilasters at the angles are carried up and finished with tall square pinnacles, and the mass is lighted by windows of an increasing number of openings as the tower ascends, beginning at about the level of the eaves of the principal roof.

At Lucca there is no capping to the campanile; at Siena there is a low four-sided spire.

Of Western Italian campanili no examples so charming and satisfying can be recalled as two in Viterbo, one belonging to the cathedral, the other to San Giovanni Battista.

Both are Pointed. The cathedral campanile attached to the west end of the north aisle of that sadly disfigured edifice is, as usual, entirely without buttresses, and for some 50 feet in height is a plain mass of masonry. Above this, four stages of coursed black and white stone, each stage having a pair of two-light windows, divided from the next by well-marked string courses, complete the elevation of the tower, which is capped by a very low octagonal spire, a feature constantly introduced.

This sort of design is of common occurrence in these parts, and is evidently derived from the Early Roman campanili, of which so many remain.

Singularly beautiful is the fenestration of this steeple of Viterbo Cathedral. The windows increase in size and height as they ascend, and considerable variety is observable in their tracery, some of which is of the "plate" and other of the "bar" kind. We have the circle with tracery radiating from a smaller one, and an arrangement of quatrefoils, all of the most graceful character. In the 50 feet of unpierced wall grey and brown stone is employed in courses, and in the pierced stages the same arrangement, but in white and grey, thus producing a most engaging effect of natural colour. The slenderer but no less pleasing campanile of San Giovanni Battista presents much the same features, though on a diminished scale.

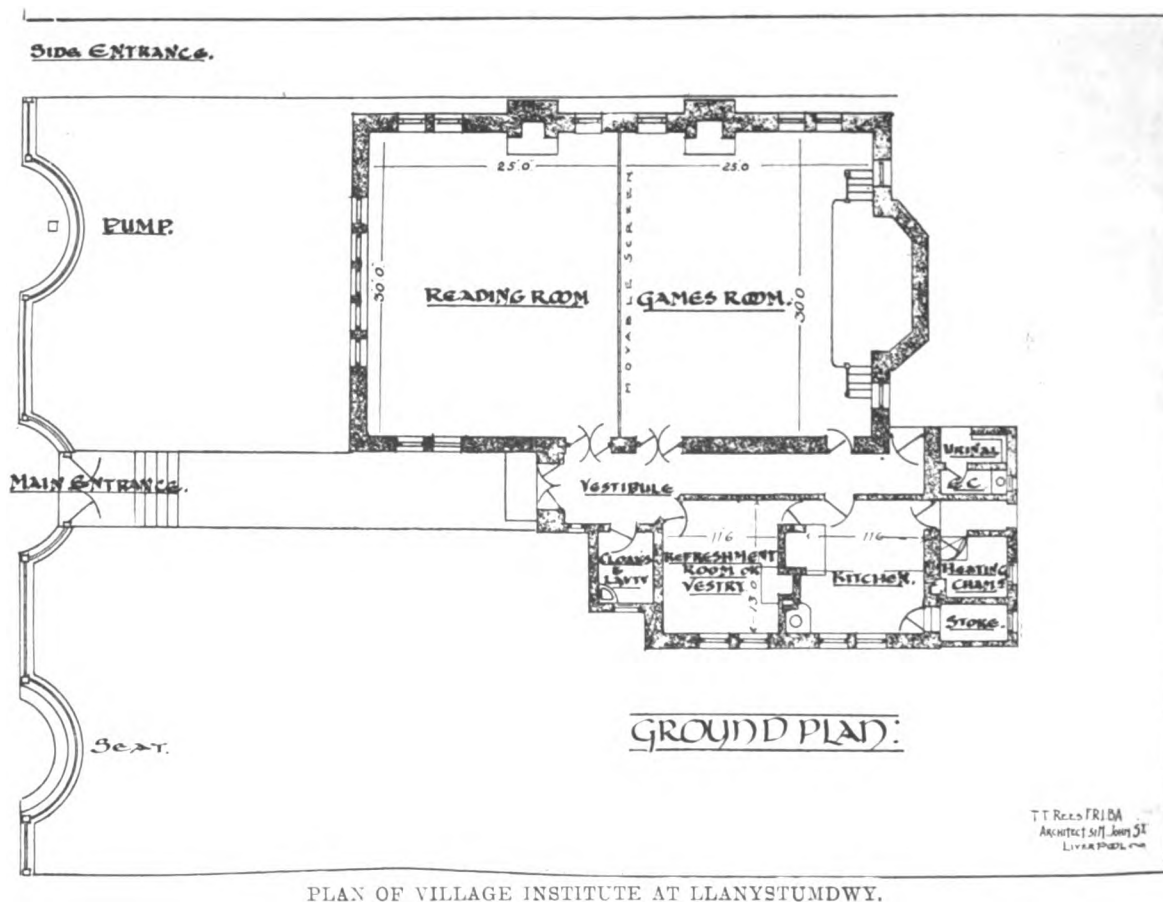

Among the few monuments of the Middle Ages in Rome to remind us of the eventful periods between the fall of the Western Empire and the Renaissance are those fine old campanili, rising so conspicuously in square towers of brickwork. Terminating in very low, four-sided spires, they are mostly adorned with inlaid crosses and discs of porphyry, and bright green or yellow earthenware, and are divided by cornices (the loftier by seven such) of marble or terra-cotta corbels, between which are open arcade windows with marble colonettes of various sizes, whose heavy and barbaric capitals are also various.

It is difficult to determine the respective ages of all the Roman belfry towers, but impossible to admit what Italian and some of the German archaeologists have claimed for their high antiquity.

The most ancient churches in Rome that still have such towers, *relatively* ancient also, are Sta Pudenziana; the Lateran, whose two actual belfries (of the fifteenth century) are insignificant; Sta Maria Maggiore; San Giorgio in Velabro, dating from the close of the seventh century; Sta Maria in Campo Marzo, also of the seventh century; and San Silvestro in Capito. To the eighth century have also been ascribed the towers of Sta Maria in Cosmedin, one of the finest and loftiest of the Roman campanili, and San Giovanni à Porta Latina; to the ninth century, those of Sta Prassede, Sta Cecilia, Sta Maria Nuova (or Sta Francesca Romana)—a most notable example—and San Michele in Sassia, near the Vatican colonnades, one of the most graceful and finely proportioned of its class in Rome.

But tradition is not proof, and in the absence of written evidence the best test as to the age of buildings must be sought in analogies of construction, applying which to the structures in question it may be determined that the Roman steeples in their aggregate should be dated as ranging at periods comprised between the latter years of the eleventh and the second half of the fifteenth century, though it seems certain that that of the ancient basilica of San Paolo fuori le Mura, almost entirely destroyed by fire in 1824, was standing long before the close of the former epoch; and, contrasting the superb tower of Sta Maria Nuova with the church from which it rises, the superiority of its masonry to that of the latter, a specimen of most barbaric construction, is very noticeable.

The small tower of an equally small church on the river-side in the Trastevere quarter—Sta Maria in Cappella—may be the most ancient in Rome, and belong to the original structure, whose precise date has not been ascertained, built in 1090, and attached to a hospital founded by the noble matron canonised as Sta Francesca Romana. Others among these towers remarkable for picturesque and interesting character that may be assigned with something like certainty to periods within successive centuries are, and may be dated. To the twelfth century the following may be assigned: Sta Maria in Cosmedin; San Lorenzo in Lucina (shorn, however, of its original height); Sta Maria in Monticelli; Sta Maria in Trastevere; San Silvestro; San Giovanni à Porta Latina; San Bartolommeo, on the Tiber Island; San Salvatore "alle Cappella," a small and dilapidated but remarkable example; and another in Trastevere, San Salvatore in Creste.

To the thirteenth century belong Sta Cecilia, Sta Maria in Trastevere, San Giorgio in Velabro, and San Michele in Sassia; Sta Croce, San Lorenzo fuori le Mura, Sant' Alessio Aventino, and, the most majestic amongst Roman belfry towers, SS. Giovanni e Paolo.

Of the fourteenth century is the tower of Sta Maria Maggiore, and of the fifteenth century, San Sisto on the Appian Way, San Spirito, and Sta Maria dell' Anima, a light, graceful steeple, with Ionic pilasters and small tapering spire.

One of the most interesting among the campanili of Central Italy is that attached to the Duomo at Pistoja. Originally it was, no doubt, nothing but a fortified square watch-tower. The warlike Teuton and the Roman clerical elements may be traced in all the ecclesiastical and secular buildings of this period. The unartistic German tribes that settled in Italy brought with them heavy and gloomy constructions, with a marked tendency to building impregnable castles. The battlements, panelled or plain, richly decorated or not, on churches and towers took their origin in the distant regions of Asia, and were in use from time immemorial all over the globe in different forms.

The campanile of Pistoja Cathedral has undergone great changes. The lower part is of an older style. We see on the bare walls here and there the arms of the governors of the town; the few small and arched windows have a pointed moulding over them.

The campanile is also known as the Torro del Podestà, from which we may assume that it was in the first instance a secular building. Its secular form has not even been changed by Giovanni Pisano's superstructure, which is light and elegant, but at the same time in many respects faulty.

(To be continued.)

ILLUSTRATIONS.

INTERIOR OF THE CATHEDRAL OF ST. JOHN THE DIVINE, NEW YORK.

THE view which we publish of the interior of the cathedral of St. John the Divine, New York, is reproduced, by permission, on a reduced scale, from a beautiful print issued by The Churchman Company, of 434 Lafayette Street, New York, at the price of \$3 on Japan paper and \$4 on Indian, mounted and postage free.

HOUSE AT CHURWELL.

THIS house is built of sand-faced bricks with white joints and white stucco panels between half-timber work, which is finished brown. The house has been built at a cost of £950 from the designs of Mr. Josiah Auty, A.R.I.B.A.

PORT PARAGON HOTEL, CLIFTONVILLE, MARGATE.

THIS hotel, which occupies a position second to none in Margate, has recently undergone a partial remodelling, the scheme providing a large entrance hall with office, &c., lounge with buffet, lavatory accommodation, and cloak-rooms, &c. The illustration shows the porch, which is in Portland stone with Sicilian marble steps and lamp pedestals. The general contractor for the works was Mr. F. Eaton, of Upper Tooting, S.W. The stonework was carried out by Messrs. Osborn Bros., of New Street, Margate, and the carving by Mr. Lionel F. Roselieb, of Park Hill, Clapham, S.W., the architect being Mr. F. Leonard Poole.

VILLAGE INSTITUTE, LLANYSTUMDWY.

THIS institute, which was opened on the 21st ult. by the Chancellor of the Exchequer, was the gift of the Right Hon. David Lloyd George, M.P. The accommodation of the building includes a reading-room and a recreation-room, divided by folding screens, which, when opened, converts the two rooms into one large hall, capable of seating over 300 people, exclusive of platform. In addition, there are lavatories, retiring-room, kitchen, and stores, giving facilities for social functions. The materials, as far as possible, have been obtained in the locality. The walls, to the height of 4 feet, are of stone, over which, as will be seen from the illustration, there is timber framing filled in with stonework and cement panels in the old English half-timbered style. The roof is of rough Welsh slates. The aim has been to make the building harmonise with its surroundings, and to carry out the idea of a village hall. The architect is Mr. T. Taliesin Rees, F.R.I.B.A., of Liverpool, and the contract was let to Mr. John Humphreys, of Criccieth.

WOLSONBURY, HIGHGATE.

THIS house has recently been erected at Highgate for Mr. R. F. Martin. It has been carried out in the Tudor style, with half-timbered overhanging upper part and gables, and the roof covered with old sand-faced tiles. The interior on the ground floor is panelled in oak, that in the dining-room being from an old house in Sussex. The modern paneling was executed by Messrs. Cleaver, of 35 Berners Street, W. The builder was Mr. W. Irwin, of 303 Essex Road, Islington, N., and Mr. John Farrer was the architect.

THE ARCHITECTURE OF LONDON HIGHWAYS.

By VIATOR.

FROM THE BANK TO THE PUMP.

IN a previous article mention was made of the principal streets which formed the chief part of London proper in the reign of the unlamented James I. Of these Cornhill was one, and it is that thoroughfare and Leadenhall Street which will be laid under contribution in order to provide material for this present article.

The order of itinerary hitherto followed will be varied in this instance; as in strolling eastwards inspecting the buildings on the southern side of Cornhill the survey will be continued along Leadenhall Street before returning westwards to complete the inspection of the former thoroughfare.

In an interesting little work called "London in 1731" (purporting to be written by a Portuguese, Don Manoel Gonzales) may be read: "Cornhill Ward comprehends little more than the street of the same name and some little lanes and alleys that fall into it, as Castle Alley, Sweeting's or Swithin's Alley, Freeman's Yard, part of Finch Lane, Weigh House Yard, Star Court, the north end of Birching Lane, St. Michael's Alley, Pope's Head Alley and Exchange Alley. Cornhill Street (*sic*) may, in many respects, be looked upon as the principal street of the City of London. . . . This street, also, is situated near the centre of the City, and, some say, upon the highest ground in it.* . . . Here, also, it is said, the metropolitan church was situated when London was an archbishopric."

As throwing light upon the thoroughfare of two centuries ago, the above is interesting; but our immediate purpose is with the buildings of the present.

In No. 1 Cornhill, the premises of the Liverpool and London and Globe Insurance Company, a good commencement is made; it is a block that commands attention (more particularly when approach is made from Poultry), occupying an angle site between Cornhill and Lombard Street. Its circular sweep of stone façade, capped by a well-contoured dome, presents a thoroughly pleasing appearance; the drum of the dome is improved by the conjunction of heavy stone trusses. The building is well proportioned, and the ornament is slight but sufficient.

The premises of the Scottish Equitable Life Assurance Society present an unusual façade, and one that is worthy of some description. It is very free Renaissance—so free, in fact, that it can scarcely be justifiably termed Renaissance, but would be better described as "twencental," with something of the vigour and rigour of the Scotch Highlands. Seven-storeyed stone block as it is, it does not look unpleasantly tall; indeed, it may be supposed that by a denizen of New York it would be regarded as undersized, in common with all other English buildings (Queen Anne's Mansions, Westminster, included). The ground and first floors are in grey granite, toning well with the white Portland stone superstructure. As regards the design, there is a Roman Doric order to the ground floor, with a very restricted projection of the ovolo and abacus of the capital. There is a squareness about the mouldings and about the general decorative scheme that may be partially Scotch, but is wholly effective, and such carving as there is well worthy of inspection. The gable is crow-stepped with doubly-broken pediment; the decorative ornament, too, is sparsely introduced, and is distinctly good.

Mr. J. Macvicar Anderson has designed a very satisfactory block in a different treatment and class in the offices of the Mutual Life Insurance Company of New York. Here is a rare combination of materials—Labradite pedestals, red granite shafts, white marble and stone. Also here is to be seen a combination (or, at any rate, a superposition) of the orders, showing Roman Doric entrance, Ionic columns and pilasters pervading the ground and first floors, Corinthian pilasters embracing the second and third floors (with Corinthian columns also to the second), and the Composite order in columns to the third floor. The ornament is well distributed, and is concentrated in the storeys below the main entablature topping the third floor. The pediment, breaking out of the entablature over the ground floor, does not give a pleasant impression, though the carved filling is good, whilst the pediment mouldings are overloaded with decoration. The balustrade at the top has "a starved and hungry look."

* This is probably incorrect, for in Panyer Alley (lying between Newgate Street and Paternoster Row) is a stone tablet on one of the houses, bearing the inscription "When y^e haveough^t The City Round, yet still this is The High^t Ground. August the 27, 1688."

The Commercial Union Office is another of the fine series of buildings in this interesting thoroughfare, which for its short route possesses a greater proportion of architecturally meritorious work than any street yet considered or likely to be considered (certainly Kingsway will not rival Cornhill). The offices now under review are Renaissance in style and six storeys in height; the ground floor is free Doric; the first floor is treated architecturally as a mezzanine floor; the Corinthian order embraces the next two storeys, the central portion being recessed behind a striking colonnade; the fourth floor is presented as "attic" in elevation. The blind balustrade at the summit is unusual, and this is surmounted by good urns.

It is to be noted that here, as in the Mansion House-Holborn route, several buildings are necessarily passed by without comment, though many of them may, and some of them certainly do, deserve the appreciative notice of the dilettante wayfarer. But the church of St. Michael may by no means be passed in this way. It is one of the few churches in the old City possessing an imposing campanile; the plain stone tower is impressive in its complete Gothicism, more pleasing, indeed, than another church tower noticed in the course of one ramble—that of St. Mary Aldermary in Queen Victoria Street. The tower, which rises in four stages, as seen from the street, stands behind the portal, and has polygonal tourelles at the angles extended into pinnacles. The "transitional" entrance, with its three orders of pillars, is a delightful piece of work, and is elaborately ornamented.

And what a contrast to the church of St. Peter-upon-Cornhill! In the latter there is nothing grand nor effective nor conspicuous even, except possibly the "key" weather-vane, emblematic of the Apostle. In place of stone, there are red brick and stucco; in place of fine Gothic there is poor and anemic Renaissance, and in place of a boldly announced entrance to an important church there is a sneaking entrance to a building which seems wishful to withdraw from the public gaze, much as the Apostle himself desired to withdraw after the notorious act of denial which he preferred to a nobler act of self-denial. These two churches seem to typify the difference between the Archangel and the arch-Apostle. The red brick tower of St. Peter is squat, and has a lead-covered cupola and spire; the dome is set square on top of the short tower, and this is, indeed, the best part of the external structure. The nave windows, acting as clerestory lights, are curious, probably unique in treatment, being circular, with the upper half framed-in square, thus introducing spandrels, utilised for the reception of swags; the upper half has, too, the arch-mould supported as on impost caps, from whose necking sweeps downward and ever inward the lower archmould.

The only other building to be passed in review, situated on the south side of Cornhill, is that numbered 54 and 55. A pink terra-cotta façade in the Tudor style of architecture. The design is sufficiently lively, without being at all fussy, and the varied colouring is very pleasant. There is but slight direct ornament, though we notice one griffin, seated upon an angle corbel and grinning down quite inoffensively upon the wayfaring public.

Crossing Bishopsgate Street, another of the old thoroughfares is entered. This is Leadenhall Street, erstwhile famous for the East India House and the Royal African House, the London offices and headquarters of the well-known trading companies (incorporated in 1600 and 1663 respectively). Leadenhall Market, too, is an old-established one, but the buildings lie off and behind the thoroughfare, and will not be considered here.

Regarding at first the southern portion of this highway, the first score of numbers do not provide much that is noteworthy, though No. 11 (The Bank of Adelaide) stands forth conspicuous from all the rest, mainly by reason of its extreme newness. It is not of any definite architectural style, but such as there is has a Renaissance feeling. An unusual detail is to be found in the ram's head masks, carved over the ground floor flanking pilasters; saving these, the carving is concentrated at the top of the building.

Nos. 12 to 20 provide an elevation in the Italian palace style, in stucco and grey brick, very wearisome to the eye, and conveying no sense of fitness, no sense of life nor soul nor inspiration.

New Zealand Chambers occupy Nos. 28 to 35, and here is a really pleasant façade, where the inspiring motif is the inset projection, treated as wooden oriels on either side of the entrance and as shaped wooden bays (in series of three) to the first and second floors. The red-brick setting to the windows adequately supports them architecturally, but seems to be the least important part of the scheme of design. We have seldom seen treatment for a commercial block at once so

FROM SKETCHES SUBMITTED BY MR. W. J. PALMER JONES FOR PUGIN STUDENTSHIP, 1912.

rational and so artistic in combination. The great flanking piers do not die into the deep cornice over the second floor, breaking off square instead; this cornice has an ovolo and deep cavetto profile, the former moulding being carved into egg-and-tongue.

Reference has been made to the Royal African House, once a feature of this thoroughfare. Its place is now taken by Africa House, which carries on the memory in a very noteworthy building. It is treated as free Renaissance, and is possessed of just sufficient ornament. Over a red granite substructure are three storeys in stone, and dormer treatment above. The appropriate carving and modelling is the particular feature of this façade; over the first floor is a vigorous picture frieze, showing various of the tropical fauna, such as the hippopotamus, the camel, the rhinoceros, &c.; and elsewhere on the elevation appear crocodiles, cranes, elephants' heads, and other varieties of the animal kingdom. This is a building to attract the wayfarer's attention, however often the highway may be traversed.

Nos. 57 and 58 (erected in 1901) present another unusual front, and this succession of surprises seems to characterise modernised Leadenhall Street. It is a characteristic that merits approval, as with the varied and unaccustomed treatment may simultaneously be observed worthy and pleasing effects. In the present instance is also to be seen another variety of the inset-bay design. The style of the façade is a plain Renaissance, the red granite flanking piers having voluted capitals. The moulded brick piers over are carried up above the line of roof as pinnacles, these being connected across the façade by an iron railing. The first and second floor shaped bay windows are sufficiently massive, whilst above the cornice the third floor has a series of nine small lights, that help to give an air of finish to the broad lines of design beneath.

No. 64 is a Gothic elevation, not inspired or admirable, but yet is an improvement on Nos. 61 and 62, which is certainly not thereby saying much for it. It is redolent of the Gothic buildings erected in the mid-Victorian period, from which it probably dates.

And now, having reached the Pump at Aldgate (which certainly does not merit much inspection), attention may be directed to some of the edifices along the northern side of our route, when the first building claiming inspection is the church of St. Katharine Cree, with its porch reminiscent of Inigo Jones. This great architect did other work here, being engaged on the building till the year 1630. It is the misfortune of the Metropolis to possess so little of Jones' work in entire buildings. The Banqueting Chamber is but a small (though magnificent) section of a monumental and magnificent scheme. No. 57 Lincoln's Inn Fields finds its interest

in the eyes of the literary public in the fact of its being the prototype of Mr. Tulkinghorn's residence, portrayed by Charles Dickens in "Bleak House," and York Stairs would be but a slight monument for any man's fame, however good this water-gate may be. This leaves but very few metropolitan buildings to the credit of Inigo Jones, but he still has the merit of having introduced into London the use of Portland stone. The Ionic porch to the church of St. Katharine Cree is interesting, but yet it is impossible to approve this tacking-on of exotic art to the vernacular body, an objection equally valid in the case of Jones' porch to old St. Paul's Cathedral. St. Katharine's Church tower at the south-west is a sturdy stone structure surmounted by a quaint little belfry, circular on plan, with its cupola supported on Roman Doric pillars; the south wall of the church, with its stepped-head fourteenth-century windows and its sundial, is full of interest.

Nos. 89 and 90 Leadenhall Street present a very passable, indeed a pleasant, elevation in stone; Gothic in style, with the window-heads filled in solid where they are not already square—a treatment eminently suitable for a commercial block; the dovetail billet ornament framing in the first to third floors is unusual, but not unwelcome. Nos. 99 to 103 are certainly enlivening to the thoroughfare, but not of equal merit to many hitherto noticed. The treatment of the entablature, broken round the columns, reminiscent as it is of Roman work, is restless—and this is, indeed, a characteristic of the block throughout; but there is some good figure modelling in the spandrels and tympanum over the entrance.

Nos. 107 to 109 we approve—a strong, healthy Renaissance stone block, boldly rusticated to the ground floor, and more slightly rusticated to the next two. The central treatment of the second floor is effective, with its coupled and engaged Corinthian columns and circular-headed windows. The flanking windows are brought out square at the head, the spandrels and side panels being carved. The carving throughout this elevation is good, and particularly effective on the third floor (treated as attic), where carved panels in very high relief carry up the lines of the columns below.

The church of St. Andrew Undershaft at the corner of St. Mary Axe cannot be passed without notice. Its massive western stone tower is in Perpendicular Gothic. The porch, with its carved shields, presents a curious effect, its label mould running on westwards beyond the vertical return, on the opposite side mitring round in the customary way. The battlemented parapet, with its stepped treatment, is also unusual, and not interesting.

Mr. T. E. Collcutt was architect of the Peninsular and Oriental Offices, but the buildings are not admirable; and if at times people are inclined to inveigh against the theory

FROM SKETCHES SUBMITTED BY MR. W. J. PALMER JONES FOR PUGIN STUDENTSHIP, 1912.

of design, surely here, where so many of the principles are contravened, the non-success of the building (architecturally regarded) justifies the belief in these principles. Nor do we approve No. 140, with its mediæval English pretentiousness, representing in stucco on red brick ground the half-timbering, which, when genuinely presented to the sight, is delightful. If there be any history attaching to the effigies of the mediæval armoured warrior on his pedestal over the ground floor, such history is outside the scope of our knowledge.

The next block (Nos. 141 to 144) it is a pleasure to regard, with its free unstyleable capitals to the ground floor pilasters, its good entablature with panelled frieze and trussed and dentilled cornice, and the good carved and floriated shield as a central ornament to the attic.

Passing onwards into Cornhill, and still looking northwards, at the junction with Bishopsgate Street may be noticed the premises of the Union Bank of Scotland, effectively treated in grey polished granite to the ground floor, the superstructure being in stone. This is a good commercial block, very little ornamented, but trusting for architectural tone in the main to its rusticated façade and the Ionic three-quarter columns, set recessed in a central position. The ground floor has but a slight cornice, thus leaving the main effect to the over-riding entablature, which is in accordance with the canons of our Art.

A very unusual elevation calls for notice in the premises of the Union Bank of Australia, with its terminal figures to the second floor and a certain Egyptian feeling pervading the façade, mingled, too, with much that is Grecian. The

whole is redolent of refined architectural taste, and is at once novel and pleasing.

Messrs. Ernest George & Yeates are responsible for Royal Exchange Buildings, dating from 1906 onwards; French Renaissance that may satisfy the cravings of some, but to our mind leaves something wanting. The details are too Gargantuesque to please our critical fancy, though perchance this is, as suggested by ourselves, a matter of individual taste.

But as regards the Royal Exchange, it may be hoped that there are not two opinions. Whether individual predilection be for Classic, Renaissance or Gothic, there should be unanimity of sentiment in respect to this fine work of Sir William Tite's, dating back seventy years. It occupies an island site; and if, when approached from the west, one's admiration for the noble portico and fine pediment is excited, it is but necessary to walk around the building in order to gain equal gratification from the north, east and south. It is well-proportioned, and, furthermore, such grace and dignity in combination are secured with the Corinthian columns and pilasters in their colossal grasp. Here, too, there is no overloading with ornament; indeed, there is but little ornament.

We see Sir Thomas Gresham (the Elizabethan founder of the Exchange) enriched in *effigies* on the eastern façade in the slight belfry tower provided; and his device, the grasshopper, is used as a weather-vane with good effect.

In drawing towards the end of our saunter, we find that the last building to be inspected enables us to continue sounding the note of praise which has been so persistent since the commencement of our present itinerary. The building now to be noticed is the veritable Old Lady of Threadneedle Street, who presents herself to our view across the Royal Exchange western parade. The Bank of England is one of the monuments of Sir John Soane, and worthily suggests itself in the method of treatment. It is but seldom that the Composite order is met with in London buildings, but it is displayed here in conjunction with a very Classic Ionic order modelled on the Bassæ temple of antiquity. Architects of to-day may well learn from the masters of the not-long-distant past the value of broad surfaces, of slight decoration, trusting more to structural features than to applied ornament.

When Don Manoel Gonzales' "London in 1731" was published, the Bank of England was of but recent institution, and not housed in any remarkable building, for our Portuguese friend is satisfied with a brief reference to the work of the Bank, without any description of the building or any note as to its location, whereas he is precise and at times prosy in regard to the public buildings in general. But in truth at the present moment there is no need to enter into detailed description of the Bank of England, any more than there would be in regard to, say, St. Paul's Cathedral. But we may be permitted to express a fervent hope that the authorities will never be moved to add another storey to the Bank, such as has been accorded in recent years to other notable London buildings, as witness the Sun Fire Office (opposite the Bank) and the Athenæum Club in Pall Mall. Truly in England Art takes a retired place, seeing that its cult is subordinated to the cult of the yellow tempter. Ay! truly, in the words of Russell Lowell, which will ring throughout the ages:

"Earth hath her price, for what she gives us.
The beggar is taxed for a corner to die in,
The priest hath his fee, who comes to shrive us,
We bargain for the graves we lie in.
In the Devil's mart all things are sold,
Each ounce of dross costs its ounce of gold;
For a cap and bells our life we pay;
Bubbles we earn with our whole life's tasking;
'Tis only God who is given away;
'Tis Heaven alone may be had for the asking."

THE approval of the Leeds City Council was given on Wednesday to the purchase by the Education Committee of an area of $3\frac{1}{2}$ acres of land in York Road for £1,700 as a site for a proposed school, subject to the approval of the Board of Education.

THE Sub-Gas Committee of the Leeds City Council have accepted the tender of Messrs. Leech, Goodall & Co. of £15,632 for a complete installation at Meadow Lane works of one bench of five beds of Dessau vertical retorts, with contained producers, having a total daily capacity of 1,100,000 cubic feet of gas.

THE DEVELOPMENT OF THE SOUTH YORKSHIRE COALFIELD AND THE HOUSING PROBLEM.*

THE problem of housing the immigrant population on the South Yorkshire coalfield is of a two-fold nature: (1) the temporary provision for a migratory class of workmen and their families—namely, pit sinkers, navvies, &c.; (2) the permanent provision for the collier population and those dependent upon them.

(1) *Temporary*.—This migratory population has, in the case of collieries which are being sunk in places remote from any village, been housed in wooden huts forming a village of from 300 to 400 workpeople and their dependents.

The sanitation of huts is of equal importance to the health of a district as that of permanent dwellings.

After a considerable experience of temporary dwellings, I have no hesitation in saying that the large employers of labour are anxious to meet one's suggestions with respect to them.

The difficulty in the matter of sanitary requirements of such a settlement is to differentiate between the essentials and non-essentials required in a dwelling which will only be occupied for four or five years at the most. The primary essentials are: A pure-water supply laid on to stand-pipes at convenient points. This provides for water being close at hand, and, on the other hand, prevents the waste of water which follows when water is laid on to each hut, and thereby curtails that excess of sewage which so often causes the difficulty in these places.

Efficient conservancy: These villages are provided with the pail-closet system, and it is on the due emptying of these at frequent intervals that so much depends. The company generally employ a special man for this sole purpose.

Recently a further step in the direction of improving the sanitation of these temporary dwellings has been adopted by the Rossington Main Colliery Company. On it being suggested to them that they might lay down their permanent sewage scheme, and use so much of it as might be required by the temporary village, they fell in with the suggestion and have now adopted it.

The general arrangement of a pit sinker's hut is as follows: The door opens on the living room, which is common to occupier, his family, and the lodgers. Here the food is cooked and the meals are served. At one end of this room a door gives access to the lodgers' bedroom, which may or may not be divided up into cubicles. At the opposite end of the hut are the private rooms of the tenant, who is usually a married foreman. The pit sinker earns "good money" and lives well. From ten to sixteen men usually board in one hut.

In addition to the provision for housing the workpeople by the colliery company, there has come into the district the man who follows the works of public construction from place to place with a rickety hut, whose old and weather-beaten timbers are, like the wrinkled face of an aged beauty, plentifully bedaubed with paint.

This he erects at some convenient spot. The control over these places is very difficult, although the proprietor usually builds the hut with very little regard to the laws of ventilation or sanitation, and is not above poaching on the preserves of the common lodging-house keeper; yet, when once he has become established, public sympathy would, I fear, be on his side if the medical officer of health were to insist on his putting his house in order.

The medical officer of health in these matters finds himself in a somewhat similar position as the old "preventive" officer was in the good old days of smuggling and cheap brandy with regard to the amount of public support and sympathy he can command.

A most remarkable fact connected with this large influx of a floating population of pit sinkers, navvies, and general labourers, is that there has not been a single case of small-pox since the year 1905.

(2) *Permanent*.—The housing of the permanent colliery population has of recent years attracted considerable attention owing to the fact that Sir Arthur Markham, Bart., M.P., has built for the employees and their families at the Brodsworth Main Colliery a model village called Woodlands.

Though this model village has largely occupied the atten-

* Abstract of Paper read before the York Congress of the Royal Sanitary Institute by Mr. Arthur Dunne, B.A., M.B., B.C.Camb., D.P.H.Lond., Medical Officer of Health for the Doncaster Rural and Bentley Urban Districts (Member).†

tion of those interested, there are several other model villages built or under construction at Edlington, Bentley, Askern, and Owston, which embrace most of the good features of Woodlands and others which are even better.

As, however, Woodlands is a happy example of the way in which the great colliery companies are providing villages for their employees in this area of the South Yorkshire coalfield, a description of it will give the chief points of all of them.

WOODLANDS.

This model village lies four miles north-west of Doncaster on the Great North Road; it is situated in the parish of Adwick-le-Street. It is built on a limestone plateau, 120 feet above sea-level. The present village comprises 850 houses, and the number of houses to the acre varies from five to eight in the two portions of the village.

The first portion of the village was erected in June 1907. Here the houses are built round a large village green. The Park, as it is called, with its fine old timber and twelve acres of grass, forms a very pleasing feature of the village.

In the extension of the village to the north of the Park the streets are laid out in broad avenues and crescents, along which trees have been planted. Between the adjacent crescents there are large open greens. The only criticism one would offer is that with so much space it is a pity that no small garden spaces have been added to these houses at the back. The houses are built in the half-timbered style, with pebble dash and red tiles to the roof. There are three types of houses with respect to accommodation:—

1. Three bedrooms, large living room, scullery, and larder. Rent 5s. 3d. per week.
2. Three bedrooms, living room, parlour, larder, scullery, and bath. Rent 6s. per week.
3. Three bedrooms, bath-room (with hot and cold water), living room, parlour, and scullery. Rent 6s. 6d. per week.

All the houses have water laid on to them, and are provided with water-closets and sanitary ashbins.

The conformation of the site of the colliery village facilitates the disposal of the sewage, which is dealt with at the sewage outfall works at a spot remote from the village. The company undertakes the scavenging of the village, and employs men solely for this purpose.

It is unfortunate that the deliberation and discussion which are essential before the local authority can obtain sanction for schemes for the purposes of providing sewage disposal works and works of public water supplies are out-distanced by the rapidity with which these large collieries are being developed, and the attendant districts around each of them.

These districts present unusual opportunities for putting into force the town planning sections of the Housing, Town Planning, &c., Act, 1909. No scheme has, however, been yet submitted to the Local Government Board.

The development is taking place at such an extraordinarily rapid rate that it cannot be wondered that the administrative machinery which, under ordinary circumstances, was quite fitted to cope with the demands on a local rural sanitary authority, has been left somewhat behind in the race.

The South Yorkshire coalfield which is now being developed all around the town of Doncaster is destined, in the opinion of colliery magnates, to become the great coal-producing centre of the future.

Lord Aberconway, whose position in the colliery world gives such weight to his utterances on the subject, has recently stated "that the South Yorkshire coalfield will in a few years increase its output of coal by 12,000,000 tons per annum." Assuming that the output of coal per man per annum remains at the present figure (namely, 263 tons), this will mean that within ten years there will be employed in this district an additional 45,000 men and boys.

With these brief remarks on this most remarkable industrial development of our time and its attendant problems, which will require to be carefully studied and solved by all concerned, I venture to predict that a more humane and rational environment for the collier and his family will bear rich fruit in future generations.

Mr. Brodie (Blackpool) confessed that he was envious at the splendid problems which those concerned in the district dealt with were called upon to solve. Here they had a condition of things to which the only parallel was the gold-mining towns of the colonies. It presented a unique opportunity for putting into practice those theories with regard to town planning which had been so much talked about, and if the opportunity was taken advantage of it would show that their discussions had not been mere words.

If they could get houses with three bedrooms let at 5s. 6d. a week then financially there ought to be no difficulty about the matter. He trusted that some day a future Congress would be able to see what had been achieved.

Mr. W. P. Costain (Great Crosby) said he had been round the district, and could see the absolute necessity for a town planning scheme. What they saw gave the lie to the suggestion which had been made in another paper with regard to spreading the manure on the ground, for in the district there were hundreds of privy middens, and they saw them in all their hideousness. In the village of Woodlands everything seemed in the highest order.

Dr. Thomas E. Francis, M.O.H., Llanelly Urban District, said he formed one of the party which Dr. Dunne had kindly shown over the Doncaster coalfield. He came from a district, namely South Wales, where colliery developments had also been very great, and much could be learned in the development of the South Wales coalfield that would be useful in this discussion. The South Wales coalfield had developed slowly, and there they had an advantage which they had failed to take full advantage of, as was seen in the present condition of the colliery towns and villages. He wished to make some suggestions that would make progress easier in the future—viz. (1) The consolidation with amendments of the Public Health Acts, which was an urgent matter, and it would be helpful if the law was uniform in England, Wales, Scotland, and Ireland. (2) The simplification and shortening of procedure under the Procedure Regulations of the Local Government Board under the Housing, Town Planning, &c., Act, 1909. In his district it had been found simpler to carry through a town planning scheme by agreement between the landowners concerned than by the Town Planning Regulations. (3) The need of uniformity in the by-laws of the various urban and rural authorities throughout the kingdom, as far as was compatible with the local conditions. He offered the suggestion that it might be possible to take some by-laws upon which there was general agreement, and insert them in the Consolidated Public Health Act mentioned above. He was much afraid of the movement now afoot to slacken considerably the requirements of the model by-laws of the Local Government Board and other by-laws, such as height of bedrooms, model by-laws respecting which had not been yet made.

Dr. Dunne, in reply, said that at a public meeting it was suggested that the surveyors should draw up a town planning scheme, and that was where they seemed to stand at present. He thought each authority should proceed with a scheme for its own locality, because if they tried to drive a dozen horses in their town planning scheme they would probably find themselves in a ditch, or more probably would never even get the harness on.

THE BATTLE OF STYLES AT DELHI.

BEFORE the end of the year the Government of India will be installed in the temporary buildings outside the old city of Delhi, and one of the first measures to be considered when the Viceroy's Council gets to work in its new surroundings will be the Bill making provision for the planning of the new city. The laying-out of the main roads and the choice of sites for the public buildings should be a comparatively simple matter; it is, says the *Manchester Guardian*, the question of the architectural style that is to rule in the new capital which has set the official authorities and the artistic enthusiasts in opposing camps.

Shall the new Delhi be European or Indian, Renaissance or Indo-Saracenic; or shall it be neither one nor the other, but a further and overwhelming exhibition of those affrighting hybrids known throughout India as the masterpieces of the Public Works Department? These questions, which have been vigorously debated since the Delhi Town Planning Commission went out from England last winter, were raised in the first instance by Mr. E. B. Havell, formerly principal of the Government School of Art, Calcutta, known in England and in India as a learned and resolute champion of Indian art and its ideals. The Public Works Department, Mr. Havell pointed out, would begin at Delhi with a clean slate. The commercial atmosphere of Calcutta has been left behind; the makers of the new city would find themselves in the heart of Hindustan, surrounded by the finest examples of Mogul design, and having at hand numbers of Indian master-builders who, as Fergusson said, could teach more of the true art of building than all the European books, and who, moreover, had never broken with the great Indian tradition. These men and the thousands of Indian craftsmen in other cities have been systematically ignored by the Public Works De-

partment, but their skill and knowledge remain, and it is now open to the Government of India to show its sense of an unequalled opportunity by making an end of the philistine indifference of the offending Department by setting its architects to work, in frank co-operation with Indian master-builders, towards the making of a metropolis which shall be Indian both in form and spirit.

In British India all official building has, from the beginning, been entrusted to the Public Works Department, and until Lord Curzon's day it was carried out under the supervision of engineers self-taught in architecture and unacquainted for the most part with Indian art and crafts. The results are patent and notorious. Engineer-architecture is to be seen all over the country, in hideous secretariats, court-houses, town halls, and official residences, and indirectly in colossal palaces of Indian princes and mansions of wealthy merchants and landlords. For in India the official influence is despotic. Whatever the supreme Government does in the region of taste and social life must in the eyes of the Indian people, and especially of their leading men, be right. And so it comes about that if there is anything worse than the masterpieces of the Public Works Department in the Governmental centres it is to be found in the outrageous palaces of Maharajahs and Nawabs, wherein the wildest licence has been given to Italian Renaissance or nineteenth-century anarchy. The engineer-architect doubtless did his best, but Lord Curzon recognised the absurdity of the practice by which the Government of India merely ignored the architect's profession, and for the past decade or so Simla has had its consulting architects. They were, however, appointed from England, they are men of purely European training, and, consequently, though professionally in advance of the Public Works Department, they cannot be counted any better than the engineers so far as knowledge of Indian architecture, structural tradition, and craftsmanship is concerned.

The advocates of an Indian Delhi have, therefore, a very definite case. They quote all the prophets of the modern art movement in proof of the thesis that architecture must be the product of a vital art tradition; they point to the undisputed break with tradition in Europe 300 years ago and the chaos of the past century or two, and they take their stand upon the declaration of James Fergusson, the eminent historian of Indian architecture:—

"Architecture in India is still a living art, practised on the principles which caused its wonderful development in Europe in the twelfth and thirteenth centuries, and there, consequently, and there alone, the student of architecture has a chance of seeing the real principles of the art in action."

Mr. Havell and those who share his views are convinced that this is as true to-day as it was when Fergusson wrote it half a century ago, and they score heavily against their opponents by citing the avowals of prominent official architects. Thus the author of a full and careful survey of the subject which appeared a short time ago in the "Dawn" magazine of Calcutta makes effective play with the admissions of two consulting architects to the Government of India, Mr. James Ransome and Mr. John Begg, in support of his case.

India knows what it means for the European architect, confessedly ignorant of the Indian tradition and Indian structural principles, to have unfettered freedom. She has seen it in many cities, and notably in Calcutta—in secretariats of what has been called the Neo-Victorian workhouse style, a High Court in florid Gothic as nearly as possible like the celebrated Town Hall of Ypres, newer Government buildings in the manner of a more pretentious Whitehall, and a Victoria memorial which, when completed, may disclose the combined features of the War Office and the South Kensington Museum.

The specific answer of the official party to the demand for an Indo-Saracenic Delhi is twofold—first, that it would be a merely archaeological revival, as unreal as Georgian Greek or Pugin Gothic; secondly, that it would be both impracticable and ruinously expensive. The builders of the great Hindu and Mogul epochs, say the official architects and their organ, the *Pioneer* of Allahabad, were concerned with the simplest structural forms—the temple, the mosque, the tomb, the "serai." They could not have met the complex demands of present-day India for Government offices, law courts, Council chambers, official residences; nor could they, without unrestricted command of time and human labour, have achieved their magnificent results—designing like Titans, finishing like jewellers. Essentially, the reader will note, this objection is based upon the assumption that the Indian tradition is dead, and that assumption, of course, is precisely what the

other side denounce as the fatal blunder of the Government in India yesterday and to-day. Why, demands Mr. Havell—

"Why should it be more difficult for professionally trained European architects to adapt the living traditions of Indian building to modern departmental needs than it was for the amateur Court officials who controlled the Mogul architectural works to make use of Hindu builders in carrying out Mahomedan ideas of building? There is no reason, except a deplorable lack of imagination."

The contention that Indian building styles cannot be adapted to current utilitarian requirements is, adds Mr. Havell, "merely a confession of departmental incompetence." And there, for the present, the controversy stands.

BRITISH FIRE PREVENTION COMMITTEE.

THE British Fire Prevention Committee opened its autumn session on the 25th ultimo with two important series of official fire tests, which have been accorded the closest possible attention by the various public authorities concerned, comprising as they did, first, a series of twenty tests with ordinary celluloid cinematograph films versus a non-inflammable celluloid film, and, secondly, an extensive series of some twenty-five fire tests as to the possibility of extinguishing petrol fires, celluloid fires, and similar outbreaks by the application of chemical foam.

The numerous visitors were received by the Chairman of the Committee (Mr. Edwin O. Sachs, F.R.S. Ed.), the Earl of Lonsborough, K.C.V.O., Sir John Cockburn, K.C.M.G., Major Cooper-Key (Chief Inspector of Explosives), Mr. Ellis Marsland (General Hon. Secretary), and other members of the Council, whilst the actual tests were conducted by strong sub-committees, with Mr. Horace Folker, F.A.I., and Mr. D. W. Wood acting as directing members.

The importance of the tests may be gauged from the fact that the Army was represented by no less than fourteen officers, including Colonel Sir H. W. Barlow, Bart., of the Royal Laboratory, representatives of the Royal Arsenal, the School of Military Engineering, the Balloon Factory, the Air Battalion, Army Service Corps, &c., the Admiralty by a number of officers and engineers, the Home Office by officials from the Explosives and Factory Departments, H.M. Office of Works by its engineering officials, the Board of Trade by its Engineer Surveyor-in-Chief, the Colonies by Captain Muirhead-Collins, R.N., for the Australian Commonwealth, and other officials of South Africa and New Zealand, the India Office by Lieut.-Colonel Muspratt-Williams, R.A., and Mr. Martyn; whilst institutions such as Trinity House, Lloyd's Register of Shipping, the London County Council, the London Port Authority, the Metropolitan Asylums Board, and other corporate bodies were represented by their leading officials, as also ten leading railway companies and ten insurance institutions.

Other notable visitors were Count de Saint Seine (the French Naval Attaché) and the German Consul and Vice-Consul.

At this stage it would be inappropriate to give the results of the official tests, as reports will not be ready for some little time, but it has been authoritatively stated that both series were of an eminently instructive character, and mark a practical step forward in the direction of fire-preventive measures.

IRON AND STEEL OF ANCIENT ORIGIN.*

SECTION B.—THE SO-CALLED IRON AND BRONZE AGES.

(Continued from last week.)

IN a most excellent sketch of the history of iron in his "Metallurgy of Iron and Steel" (1864), Dr. John Percy, F.R.S., stated, as the author has already pointed out, that iron is so rapidly corroded and wasted away by the oxygen of the air, even in dry climates, that it is not to be wondered at that only few ancient specimens have remained preserved.

Dr. Percy also believed that from metallurgical considerations it is not unreasonable to suppose that the so-called Age of Iron preceded the Age of Bronze, or, if not, was concurrent. The metal of the latter age required more skill to produce than iron, whose process of production in its simplest forms is not so difficult. As Dr. Percy points out, if a lump of red or brown hematite be heated for some time in a charcoal fire, well surrounded by or embedded in the fuel, it will be more or less completely reduced so as to admit of being easily forged at a red heat into a bar of iron.

* Abstract of a Paper by Sir Robert Hadfield, F.R.S. (Sheffield), entitled "Sinhalese Iron and Steel of Ancient Origin," read before the Iron and Steel Institute at the annual meeting.

Singular to say, the author cannot find even one analysis of an ancient iron specimen by Dr. Percy, whose eminence in the metallurgy of iron and steel during the last generation was renowned, thus showing that specimens of such material were indeed *rara aves*. The author therefore believes that the ancient specimens now described for the first time represent an accurate analysis of ancient iron, in this case made about 1,400 years ago. They also probably represent the type of material produced at a much earlier date.

Mr. St. John V. Day's "The Prehistoric Use of Iron and Steel," published in 1877, and Beck's *Geschichte des Eisens* (1903), in five volumes, covering no less than about 6,000 pages, are both remarkable books on iron and steel in reference to their past history.

Day believes, with Dr. Percy, that the use of iron has a very ancient origin, and preceded the so-called Bronze Age. Day says "that the earliest of substances with which man was acquainted was unquestionably iron, and almost certainly steel; . . . and that this is true whether we look to Egypt, Babylonia, or Proto-Chaldea and Assyria, on the one hand, or China on the other."

Day points out that iron has been discovered in the Great Pyramids, the oldest buildings known to men.

Lepsius, an Egyptologist of the highest rank, says that, "considering the frequent working of granite in large masses, which can be proved near the fourth Manethoic dynasty, it cannot well be doubtful that since that time, and indeed earlier, iron and the hardening of it were known."

Many tablet pictures show workers wielding tools which could not very well be those other than of iron or steel, and Maspéro, in the interesting recent correspondence with Osmond, referred to in this paper, admits the wall pictures of Egypt show workers handling tools which were surely of iron or steel.

Dr. Percy, therefore, seems fully justified when, in writing to Mr. Day, he makes the following important statement:—"I become more and more confirmed in my opinion that archaeologists have been generally mistaken concerning the so-called Iron Age. I am collecting information on the subject from time to time, and as yet have met with nothing in opposition to the opinion above mentioned."

Professor Max Müller, so Day points out, stated that "in the Homeric times knives, spear points, and armour were still made of copper; and we can hardly doubt that the ancients knew the process of hardening that pliant metal, most likely by repeated smelting and immersion in water." The author quite agrees with Day that such a statement on the face of it cannot be correct, for copper is not hardened by immersion or cooling in water, but, on the contrary, it is softened. Moreover, no one has yet been able to harden copper in the manner that iron does when combined with carbon. If such an art had been known, it is difficult to imagine that the knowledge would have been entirely lost; it would have been too valuable. The world has yet to discover a method of hardening copper, in the sense of producing a material which can be compared with hardened steel. Alloys of copper with tin and other elements are well known, but their qualities render them unsuitable for purposes where iron and steel are used.

In the same manner Day, rightly, the author thinks, took the late Right Hon. W. E. Gladstone to task with regard to his laborious investigation of the Homeric epic, when announcing "the age of copper is the first and oldest of the metallic ages, which precedes the general knowledge of the art of fusing metals."

SECTION C.—INDIAN AND SINHALESE IRON AND STEEL.

As bearing upon this subject of Indian metallurgical knowledge in 1837 and 1839, Mr. J. M. Heath contributed two interesting papers on Indian steel to the Royal Asiatic Society.

The author's views entirely coincide with those expressed by Heath nearly three-quarters of a century ago—namely, that the great works of stone in Egypt were undoubtedly carried out by means of iron and steel tools.

Heath's remarks are so interesting that the author quotes them in full, as follows:—

"The antiquity of the Indian process is no less astonishing than its ingenuity. We can hardly doubt that the tools with which the Egyptians covered their obelisks and temples of porphyry and syenite with hieroglyphics were made of Indian steel. There is no evidence to show that any of the nations of antiquity besides the Hindoos were acquainted

with the art of making steel. The references which occur in the Greek and Latin writers on this subject served only to better their ignorance of it; they were acquainted with the qualities and familiar with the use of steel, but they appear to have been altogether ignorant of the mode in which it was prepared from iron. The edges of cutting instruments of the ancients were all formed of alloys of copper and tin, and we are certain that tools of such an alloy could not have been employed in sculpturing porphyry and syenite.

"Quintus Curtius mentioned that a present of steel was made to Alexander of Macedon by Porus, an Indian chief, whose country he had invaded. We can hardly believe that a matter of about 30 lb. weight of steel would have been considered a present worthy of acceptance of the conqueror of the world had the manufacture of that substance been practised by any of the nations of the West in the days of Alexander.

"In view of the maritime intercourse between Egypt and the East, it appears reasonable to conclude that the steel of the South of India found its way by these routes from the country of Porus to the nations of Europe and Egypt."

Heath states, therefore, that "the claim of India to a discovery which has exercised more influence upon the arts conducing to civilisation and the manufacturing industry than any other within the whole range of human invention is altogether unquestioned."

In his papers, Heath also points out that Dr. Buchanan's "Travels in the South of India," published in 1807, contains very minute and correct accounts of the native process of smelting iron and making it into steel, this process probably representing practice handed down from previous ages. The book is illustrated by engravings.

Without doubt, therefore, the processes of making iron and steel have been used in India for many thousands of years. Probably the ancient specimens seen by the author at Colombo were not produced by the crucible process, but that the crucible process has been used in Ceylon for a long period of time may be taken as established.

This would also carry with it the proof that while the Huntsman process was novel as regards application in Great Britain, and, of course, worked out on a more practical and commercial system than the methods of the East, yet it was, after all, only a development of methods, or an independent comparatively modern discovery of methods, long employed in India.

The manufacture of this crucible cast steel by the Sinhalese is now, however, almost an extinct industry, a fact due to the operation of economic laws, as steel can be imported from Europe more cheaply than it can be manufactured locally.

SECTION D.—DELHI AND DHAR PILLARS IN INDIA.

One of the most notable ancient specimens of iron is the famous Pillar of Delhi, which is not the less interesting when we find it is stated that the city itself, "Imperial Delhi, the capital of all India," as Sir Alexander Cunningham in 1864 termed it, owed its name to this pillar. In the light of recent political events, this prophetic utterance is now an actually accomplished fact, for on December 12, 1911, Delhi was made the capital of our great Indian Empire. We have also this remarkable chain of circumstances. Delhi took its name from the very pillar now described, the Hindoo term being "Dhelli," or unstable, as explained later on. At Delhi King George V., the first English monarch to be present in person, has been proclaimed Emperor in Durbar, and finally, Delhi is now the seat and actual "Capital of all India."

Ancient associations, historical and legendary, combine to invest Delhi with exceptional dignity in the eyes of both Hindoo and Mohammedan Indians.

In the official Government despatches of last year it was stated that "Delhi is still a name to conjure with; it is intimately associated in the minds of the Hindoos with sacred legends which go back even beyond the dawn of history."

As shown in this paper, seeing that Delhi itself takes its name from the Iron Pillar, and that it is now the capital of our Indian Empire, with its three hundred millions of inhabitants, this particular article of iron is of more than ordinary interest. In view of its importance, what follows may, therefore, be of interest. There was formerly a plaster cast or model of it in the Victoria and Albert Museum in 1873. The author spent some time in trying to find this at South Kensington, but finally discovered that it was, unfortunately, destroyed during a fire in 1885, and has never been replaced.

In the *Archæological Survey of India*, page 169 (four reports made during the years 1862-65), Sir Alexander Cunningham, C.S.I., &c., states that one of the most curious monuments in India is the iron pillar at Delhi. Whilst there are many large works of ancient times in metal, for example the Colossus of Rhodes, the gigantic statues of the Buddhists, and others, these were of brass or copper, all of them hollow and built up of pieces riveted together, whereas the Pillar of Delhi is a solid shaft of wrought iron, upwards of 16 inches in diameter, and 22 feet in length, welded together, although the welding is not altogether perfect. In any case, it was a very creditable piece of work for a metallurgist of at least 1,600 years ago. At one time, owing to its peculiar colour or hue, it was thought to be of "mixed metal" or even bronze, this belief probably arising from the curious yellow appearance of the upper part of the shaft, which Cunningham says he himself observed.

He adds that he obtained a small fragment from the rough lower part of the pillar, which was submitted to Dr. Murray Thompson of the College at Roorkee for analysis, who informed him that the metal was "pure malleable iron of 7.66 specific gravity." Practically pure iron (99.87 per cent. iron) has a specific gravity of 7.8477. Therefore, the material of this pillar could not have been pure. Probably it was a somewhat inferior type of wrought iron, permeated with slag, and high in phosphorus, like the Sinhalese specimens described by the author in this paper. Pure iron, having the specific gravity mentioned, would weigh 490 lb. per cubic foot; the Delhi Pillar, with 7.66 specific gravity, would weigh 477 lb. per cubic foot.

(To be continued.)

COMPETITION NEWS.

CHORLEY.—The Education Committee have appointed Mr. J. Brooke, F.R.I.B.A., of Manchester, as assessor of the designs submitted for the proposed Council School.

READING.—The Education Committee are preparing conditions for the competition for the proposed new buildings of the Kendrick Schools. Premiums of 70 guineas and 30 guineas will be offered. Mr. Ernest Newton, F.R.I.B.A., will, as we have already stated, act as assessor.

WIGAN.—The Education Committee at their last meeting referred back a recommendation that Mr. W. C. Ralph, F.R.I.B.A., be appointed as architect for the proposed High School for Girls. The Chairman of the committee stated he had a letter signed by four different architects protesting against the appointment, and it was eventually decided that the appointment be thrown open, the committee to arrange the details of competition.

NOTES ON BOOKS.

"The Principles of Structural Mechanics Treated without the Use of Higher Mathematics." By Percy J. Waldram, Lecturer on Structural Mechanics, Architectural School, Central School of Arts and Crafts, London. (London: B. T. Batsford. 7s. 6d. net.)

This is one more effort to make intelligible to the ordinary architectural student the methods of calculating the strength of structures with which he has to deal, and the basis of it appears to be the use of experimental investigation, as applied by the author at the L.C.C. Central School of Arts and Crafts. The student is strongly recommended to learn the principles and prove their application by experiment, and the use of spring balances, cords, weights, and pulleys for experimentally demonstrating and determining the accuracy and amount of forces, loads and stresses in constructive problems is well explained. These are admirable methods for teaching students in a class, but we agree with the author when he says that whilst private experimental work will teach a great deal, to most men its range is extremely limited. He goes on to say "the author's experience tends to show that by far the best method of thoroughly learning the subject consists of a complete course of experimental research, involving the actual measurement of forces, stresses, and strains by the student, coupled with clear explanations and frequent and well-supervised exercises in practical design."

The author's fondness for demonstrating calculations by means of apparatus is possibly the reason for his exposition of the operation of the slide rule, although for all practical purposes this instrument may be regarded as obsolete as a sundial. We recognise that the slide rule permits of logarithmic calculations in simple fashion, but its limitations prevent it from comparing in utility with a table of logarithms for indoor use. It may still be of

some value for those who desire to make logarithmic calculations with an instrument which they can carry in their pockets.

In introducing the subject of graphic statics the author does well to point out the limitations of graphic methods of calculation, but we are not disposed to agree with his assumption of the accuracy of what he calls abbreviated methods of calculations—that is, calculating by means of models made of light laths, spring balances, and loops of string. We think that his statement that "All the stresses and reactions for any loading of the model being known through the medium of the different spring balances, the accuracy of diagrams drawn for the purpose of calculating those stresses and reactions can be readily tested" is too optimistic, because the weight of even light spring balances must have an appreciable effect on the distribution of stresses in the model polygon, although this element of error is not perhaps of particular importance when models are used merely for the purpose of demonstration.

The author's explanation of the theory of moments and their graphic representation is excellent, and should be clear to the dullest student. His illustration of the bending moment of the load on a beam as equivalent to those of a double cantilever is particularly happy as a method of explaining the fact which is usually difficult to grasp—that it is the reaction that makes the bending moment. Other difficult subjects for the novice to comprehend, but which Mr. Waldram to our mind makes clear and easy, are the radius of gyration and the method of sections, and on the whole we can confidently recommend this book to the student to whom calculations are more or less of a bugbear.

BOOKS RECEIVED.

"Colour in the Home, particularly as applied to the Industrial Arts. With Notes on Architecture, Sculpture, Painting, and upon Decoration and Good Taste." By Edward J. Duveen. With forty-six full-page illustrations, of which thirty-four are in colour.

(London: George Allen & Co., Ltd. 42s. net.)

"Black's Modern Guide to Harrogate." Edited by Gordon Home. With twelve illustrations in colour facsimile, a plan of Harrogate, maps of the district, and four other plans.

(London: A. & C. Black. 1s. net.)

"Southern England. Coast and Countryside. Kent, Sussex, Hants, the New Forest, the Isle of Wight, Wilts, &c." The Homeland Reference Books. No. 5. Edited by Prescott Row and Arthur Henry Anderson.

(London: The Homeland Association, Ltd. Frederick Warne & Co. 1s. net.)

"Surveying and Surveying Instruments." By G. A. T. Middleton, A.R.I.B.A. Third edition, revised and enlarged.

(London: Whittaker & Co. 5s. net.)

"Building Construction." A text-book on the principles and details of modern construction, for the use of students and practical men. By Charles F. Mitchell, Lecturer on Building Construction to the Polytechnic, Regent Street, London; Headmaster of the Polytechnic Technical School, &c., assisted by George A. Mitchell, A.R.I.B.A. Advanced and honours courses. Seventh edition, thoroughly revised and much enlarged.

(London: B. T. Batsford. 6s. net.)

"The Cheap Cottage and Small House." A manual of economical building. By J. Gordon Allen, A.R.I.B.A., &c. Second edition. (Letchworth: Garden City Press, Ltd. Paper, 1s. 6d.; cloth, 2s. 6d. net.)

"English and Welsh Cathedrals." By Thomas Dinham Atkinson, architect. With twenty illustrations in colour by Walter Dexter, R.B.A., twenty in monochrome, and forty-eight plans.

(London: Methuen & Co., Ltd. 10s. 6d. net.)

"Practical Cabinet Making and Draughting." By J. H. Rudd.

(London: Benn Bros., Ltd. 4s. 6d.)

"Papers of the Paint and Varnish Society, 1910-11." Edited by the Secretary. (London: The Paint and Varnish Society.)

FORTHCOMING EVENTS.

Monday, October 14.

Architectural Association : Inaugural Address by Mr. G. C. Horsley, F.R.I.B.A., President, and Distribution of Prizes, at 8 P.M.

London Association of Municipal Engineers : General Meeting at 7.30 P.M.

Tuesday, October 15.

Institution of Municipal Engineers : Eastern District Meeting at Godmanchester.

Thursday, October 17.

Society of Architects : Annual General Meeting at 8 P.M.

London Association of Master Decorators : Annual Dinner at 8 P.M.

London University : Course of Lectures on "French Renaissance Architecture" by Mr. W. H. Ward, M.A., F.R.I.B.A., at University College, London, at 6 P.M. (2) "The Beginnings of the Renaissance in France. The Italian Craftsmen. Charles VIII. and Louis XII."

HISTORICAL MONUMENTS IN BUCKINGHAMSHIRE.*

THE Royal Commission entrusted with the duty of making an Inventory of the Ancient and Historical Monuments and Constructions connected with, or illustrative of, the contemporary culture, civilisation, and conditions of life of people in England (excluding Monmouthshire) from the earliest times to the year 1700, and of specifying those which seem most worthy of preservation, have now issued their first volume* on the Historical Monuments of Buckinghamshire, which county has for the purpose of the Inventory been divided into North and South.

The present volume deals with the Southern portion, and includes the hundreds of Stoke, Burnham, Desborough, Aylesbury, and parts of Ashendon and Cottesloe. As with the initiatory volume of the Royal Commission's Inventory dealing with the Historical Monuments of Hertfordshire, the book now issued forms a charming and interesting record of the antiquities of South Buckinghamshire, not merely from the archæological and antiquarian point of view, but from an artistic or architectural point of view.

Valuable as an inventory the book is also highly interesting and instructive as a picture book, containing a large number of very excellent photographs, besides plans drawn to scale.

Buckinghamshire, notwithstanding its proximity to London, is little known to architectural students, and those who are domiciled in the Metropolis will be agreeably surprised to find from the excellent illustrations in this volume the amount of admirable and instructive work of all periods, within the scope of the Commission, that is to be found within the limits of a Saturday half-holiday excursion.

The sectional preface epitomises records of the monuments under various headings. Earthworks are comparatively unimportant, and of 128 examples over 100 are homestead moats, tumuli, or other works of minor importance.

Roman remains are also somewhat rare, and the Inventory records in all no more than ten dwelling-houses, large and small together.

The building materials of South Buckinghamshire, principally used in ecclesiastical and secular architecture, are flint, stone, brick and half-timber, and the preface

groups together the more important examples of the use of each of these materials, so that the student of treatment of material can at once find out where to go.

On the historical side, ecclesiastical buildings are chiefly of early work, nearly half the old churches containing remains of the twelfth century.

There is a considerable amount of good thirteenth and fourteenth-century architecture, but we are told that good work of the fifteenth century is more difficult to find, although the nave arcade of High Wycombe and the choir of Eton College Church stand out as specially noteworthy.

The photographs indicate that as a general rule mediæval ecclesiastical work is in South Bucks of good quality and a safe subject of study for young architects.

The only considerable traces of monastic remains in South Buckinghamshire are in buildings that once belonged to the Augustinian order, at Burnham, Long Crendon, and Great Missenden; but there is a fair amount of domestic work, both town and country, which not being of the greatest magnitude is perhaps the more valuable to the student. Although there are no good examples of cottage architecture of an early date, there are a large number of small houses at least as early as the sixteenth century. Many of these are of rectangular plan, with two rooms on each floor and a central chimney-stack. L-shaped plans are also common, and every possible modification of both types is to be found.

A farmhouse at Brill, which is illustrated, is a good example of small work of the seventeenth century, and a house at Chilton, dated 1683, illustrates a plain rectangular plan common about that date.

There are a number of small buildings of the same period throughout the district, which are enumerated in the Inventory, and these form a useful field of study for the designer of small houses, which in the present day seem to provide the largest portion of the work that is likely to fall into the hands of the young architect, not to say of many of his seniors.

A page of illustrations reproduces photographs of small houses at Ashley Green, Brill, Penn, Wyrardisbury, Great Marlow, and Chesham, which might have been designed, save for their evidence of the wear and tear of time, by Mr. E. L. Lutyens.

The notable fittings still preserved in churches, houses, and elsewhere are of course enumerated in their proper place in the Inventory, and in the index a full list of those recorded is given, whilst in the sectional preface special mention is made of some of the more remarkable of these. We are told that only two pre-Reformation altar stone slabs remain intact, and that of a total of five bells known to have been made by Michael de Wymbis,

* *Royal Commission on Historical Monuments (England) : An Inventory of the Historical Monuments in Buckinghamshire. Vol. I. Anno Dñi. M.C.M.XII. (London : Published by His Majesty's Stationery Office. To be purchased, either directly or through any bookseller, from Wyman & Sons, Ltd., Fetter Lane, E.C.; or Oliver & Boyd, Tweeddale Court, Edinburgh; or E. Ponsonby, Ltd., 116 Grafton Street, Dublin. 15s. 6d.)*

who worked in London about 1300, three are to be found in South Buckinghamshire. The most important brasses in the county are also pointed out, and the most noteworthy examples of chairs, chests, and cupboards particularised.

Examples of some of the curiosities of church building are to be found in this part of the county, such as the consecration crosses, Easter sepulchres, and low side-windows. Then we find an illustration of an oak arch in the church of St. Lawrence, Upton, Slough, a thirteenth-century piece of work, in which the form of mouldings and dog-tooth ornament customary in stone are reproduced in wood; thus the seeker for curios will find material in the Inventory, as well as the student of art.

One of the most valuable features which is to be found both in the Hertfordshire Inventory and the present volume is the admirable method in which the index is compiled. This contains not only references to places and individuals, but also collected lists of special features; thus by reference to the index, if one wishes to know where there are to be found examples of alabaster figures and monuments in churches we find a list from which we can see where they remain, together with their date. So also we may look for arabesque work, barge boards, barns, bay windows, bell turrets, bench ends and fronts, chimneys and doorways—in short, any particular grouping which we may desire to study.

We referred earlier to the materials enumerated in the sectional preface, and in the index we find the examples of these carefully collated, so that we can tell at once where to find ashlar, brick, either ordinary or rubbed, chalk, and other kinds of stone, wattle and daub, and the local material witchert.

The lover of heraldry will revel in this volume, when he finds that the index contains four pages of reference to examples that are to be found preserved in South Buckinghamshire.

These Inventories of the Royal Commission are thus not merely catalogues, but invaluable guides to students and lovers of the art and the history, the culture, the civilisation and conditions of life of our ancestors, and in particular no student of architecture, living in London or the home counties, could better spend fifteen shillings and sixpence than in purchasing volume one of the Inventory of the Historical Monuments in Buckinghamshire.

We look forward with eager anticipation to the appearance of volume two of the Inventory of Buckinghamshire Monuments and of that on the Monuments of Essex, which are next in order of the publications of the Royal Commission.

NOTES AND COMMENTS.

Is the discussion which has been in progress in the daily Press on the style of architecture to be adopted in the new Delhi, the advocates of an Indo-Saracenic design, as they call it, ignored the fact that there is no one dominant style which may be regarded as peculiar to India, and expressive of its nationality. There are a score or more of distinct styles, each of which can be called an Indian style, as any one of the many dialects spoken in the country may be called Indian. So that when the Government are asked to adopt the Indian style of architecture, it is incumbent upon those who make the demand to define what is that style. The examples of attempts to unite modern requirements, modern methods and modern finance, with forms of Indo-Saracenic architecture have already resulted in a sufficient crop of abortions, which have as much resemblance to the native architectural styles of India as the Alhambra of Leicester Square has to the Alhambra of Granada. We should not feel proud if the new capital of India were to be stocked with some more of these monstrosities.

There seems to be an idea in the minds of the advocates of the Indo-Saracenic style, that if Renaissance or Classic were adopted for the new Delhi, this would necessarily be

of the modified form which has prevailed in England since the times of Inigo Jones and Christopher Wren. It is forgotten that Classic styles of architecture took their rise in more southern latitudes than England, and accordingly they provide scope for a suitable architecture to be situated in a more sunny country than our own island. Thus there can be no reasonable objection to the suitability of Classic architecture for India. From the sentimental point of view we agree with those who hold that, inasmuch as British rule in India is not native but alien, it is logical that the Governmental architecture of the capital should also be of an alien type rather than Indian.

We are sorry to know that some of the bishops are voicing opposition to the inclusion of churches amongst ancient monuments. Possibly no class of memorials of the past have suffered more than our churches from the insufficiency of care which has been bestowed upon them by those in whose custody they have been for centuries. Carelessness, unwise zeal, and non-appreciation due to ignorance, have all contributed to the destruction, removal, alteration and so-called restoration of ancient monuments of ecclesiastical character. The Bishop of Lincoln says that church folk are blind if they do not see that their churches have an antiquarian interest of the highest value, and criminal if they do not safeguard these priceless treasures and keep them from injury. This is exactly the whole reason for the national protection of ancient monuments. Their custodians in the words of the Bishop have not safeguarded these priceless treasures in the past, and are therefore criminals. Legislation accordingly is necessary to prevent the repetition of the crime.

Sir Rider Haggard in writing in the *Daily Mail* about cottage building in our villages, rightly points out that it is impossible nowadays to build cottages which can be let at a rent which the tenants can afford to pay, but we do not think that he has quite grasped or at any rate expressed the reason why this should be so any more in the present than in the past. The difference seems to us to be that in the past the labourer's cottage was part of his wage. The land-owner built the cottages and let them at non-remunerative rents to workers on the land, so that they received their wages partly in coin and partly in house room. In those olden days there were many privileges which the farm labourer received as part of his remuneration—butter, milk and other things off the farm. Now under the leadership of trade union agitators the farm worker receives more money. The profits of farming and of the land will not permit of the farm labourer having a greater share than he had in the past, so that if he now takes in cash all the wages which agriculture can provide for him, no one can afford to let him have a cottage at half rent.

Sir Rider Haggard says, "the land, as distinguished from the towns of England, could I am convinced carry twice its present population to the great good and safety of the State," and he advocates that the State should find the money necessary for the adequate housing of the rural population and write off the inevitable loss. Certain it is that the State has managed its affairs so that agriculture is no longer a profitable industry, and if it is desirable in the interests of the State and town dwellers that agriculture cannot be allowed the conditions by which it can find prosperity on its own bottom, it is only right that agriculture should be subsidised by the State.

SCHOLARSHIP IN ARCHITECTURE AT ROME.

CANDIDATES who are eligible to compete in the open qualifying examination for the Scholarship in Architecture at the British School at Rome offered by the Commissioners for the Exhibition of 1851, particulars of which were announced in the *Times* on August 17, must apply in writing to the Hon. General Secretary, British School at Rome, 54 Victoria Street, London, S.W., for particulars of the subject set for the examination on or before October 31. The subject will be forwarded by post on November 5 to intending candidates, who must be careful to write distinctly in their applications their full names and addresses.

IGHTHAM.*

IGHTHAM MOTE, or, as it is variously called, The Mote, and The Moat House, occupies a somewhat unusual position for a place of its size.

It seems to have been generally customary for the nobles and squires of mediæval ages to build their castles and manors upon eminences, or at least on level ground; but this grand old moated manor house is situated in a rather deep and narrow gorge, almost concealed from view by the well-wooded greens and hills and crags that closely encompass it.

It is reached by a narrow road, bordered on one side by a wood, and upon the other by a streamlet which feeds a lake supplying water to the moat, which in turn by its outflow forms another small lake or pond and a stream that ultimately finds its outlet into the river Medway at Snoll Hatch, in the parish of East Peckham.

Many people suppose that the name Ightham Mote is derived from the moat surrounding it, but this opinion is based upon altogether insufficient data. At the probable time of its erection a moat was quite a common feature in the defensive scheme of any important dwelling, but the word mote was used in quite a different sense, and signified a meeting-place—for example, the Great Gemot or Parliament, the Sciregemot or Great Shire Council, the Wittenagemot or Council of the District, the Manor Mote, Porte Mote, and others; and as the De Hauts, the first authenticated owners of the property, were very powerful and overlords of the district, it is more than likely conclaves of importance,

and one on the north, the former approached by a stone bridge and the latter by a wooden one across the moat.

Very little is known of the earliest history of The Mote. The builder's name is lost in antiquity, and in the absence of authentic deeds and plans it is impossible to definitely state the exact age of much of the building; but fortunately it seems to have been almost continually in the hands of gentlemen of culture and discretion, and whenever restoration has become necessary such work has usually been carried out with due observance to the style of the part repaired; so therefore by carefully studying the various architectural features it is possible to estimate fairly accurately the date of any portion.

The oldest part now remaining is the western wall of the quadrangle, which possibly belongs to the twelfth century, but a very considerable part of the eastern side, including the hall, is undoubtedly fourteenth century, of about the time of Edward III.

Hasted in his "History of Kent" says "it belonged to Sir Ivo or Ivor de Haut in the reign of Henry II., and continued in his family for over 300 years." This, however, cannot be absolutely correct, because it is certain that Sir Thomas Cawne or Couen, who resided at Nulcombe Manor, in the adjoining parish of Seale, and who died in the reign of Edward III., left The Mote, together with all the lands he possessed in Egytham and Sherborne, to his son Robert, and there was at least one other alien ownership.

About 1377, however, the house seems to have been in

IGHTHAM MOTE.—NORTH-WEST CORNER OF QUADRANGLE.

bearing upon the government of the locality, were conducted here, and hence the name.

Be that as it may, The Mote as we know it at the present time is certainly one of the best, if not indeed the best, example in this country of a moated and fortified house of feudal times, evidently built when might stood for right, and constructed therefore so as not only to afford a place of residence and rest for its owner, but strongly enough to withstand a possible siege.

The moat is almost rectangular and nearly square, measuring about 174 ft. by 163 ft. The breadth varies between 16 ft. at the north-east corner to over 30 ft. at the south-west, and the water is from 3 to 12 ft. deep. The building itself rises directly from the water and is quadrilateral in plan, having an external measurement of about 126 ft. from east to west by an average width of 113 ft. from north to south. It is two-storeyed, the lower portion being chiefly of mixed stone and brick, while the upper is mainly half-timbered work, carried out in places beyond the lower building line upon brackets.

The buildings enclose an open courtyard and garden of about 76 ft. by 53 ft.

The principal entrance is on the western side, through a gateway beneath an embattled tower, to which access was formerly gained by means of a drawbridge, but which is now reached by a wide gravelled footway over a two-span arched stone bridge. There are two other entrances, one on the east

the possession of the De Haut family in the person of Henry de Haut, High Sheriff of the county, and in 1450 it was owned by Richard Haut, Sheriff of Kent, who was high in the favour of Edward IV., with whom indeed he was distantly related, his mother, Matilda Woodville or Wydeville, being an aunt of Edward's wife Elizabeth.

This gentleman fell upon evil days, for having joined the rising in favour of the Earl of Richmond, he was taken prisoner and executed at Pontefract. His estates were confiscated and given by Richard III. to Sir Richard Brackenbury, Governor of the Tower of London, some historians believe, as the price of his silence in the matter of the murder of the two young Princes. Brackenbury held the estate for rather less than two years, and after his death at the battle of Bosworth Field, it was once again restored by Henry VII. to the De Haut family, as represented by Edward, a son of the late Richard de Haut.

It remained in his family until 1521, when it passed by sale to Sir Richard Clement. This gentleman probably added much of the Tudor woodwork and completed the quadrangle by building the chapel. There is a brass in Ightham Church to the memory of his first wife, upon which a blank is left for the date of his own demise. The Clements possessed the property for some time, until a niece of Sir Richard's carried it by marriage to Hugh Pakenham, whose only daughter became heiress of The Mote. She married Sir William Sydney, the hero of Flodden Field; and her husband entered into an arrangement with her father whereby The Mote was alienated and sold to Sir John Allen, a former Lord Mayor of London, in 1544. After his death his grand-

* Read at a meeting of the Upper Norwood Athenæum by Mr. Hamilton E. H. Biden.

CHURCH OF ST. PETER, IGHTHAM.

son, Sir Charles Allen, sold the property to William, afterwards Sir William Selby, a younger son of Sir John Selby, of Branxton, in Northumberlandshire. He spent the later part of his life at The Mote, and died there in 1611, aged eighty years.

A nephew of the same name succeeded. He married Dorothy Bonham, resided at The Mote, and there breathed his last in 1638. The tombs and effigies of both these gentlemen, together with that of the widow of the latter, are in the church at Ightham. The widow, Dame Dorothy, was in possession until her death in 1641, when it passed to Mr. George Selby, of London, who resided there and was Sheriff of the county in the reign of Charles I. He died in 1667, and his eldest son William succeeded; his son John and his grandson William followed in the occupation of the seat. William Selby resided at The Mote, and died possessed of it in 1773, leaving it to his wife, who resided there. She died in 1788, and, being without living issue, the estate devolved to John Brown, Esq., a connection by marriage, who thereupon assumed the name of Selby. It remained in various branches of the Selby family until 1889, when it was purchased by the present owner, Thomas Colyer Fergusson, Esq., M.A. This gentleman has devoted much time and care to research in verifying the history of The Mote, and has expended large sums of money in restoring and preserving the edifice.

Entering by the main gateway, it will be noticed that the archway is faced with a Perpendicular obtusely-pointed arch carried upon moulded corbels. This and the windows above on both sides of the tower appear to be fifteenth-century work, and are possibly restorations or alterations carried out by Sir Richard Clement. The tower itself was built about 1486 by Edward Haut, who was well favoured by Henry VII. in recognition of his father's heavy sacrifices in the cause of the House of Lancaster. It is said that the King and his Queen were entertained by him at The Mote upon more than one occasion.

The small turret at the top of the tower has been added by the present owner, in conformity to what was probably the original design.

The remainder of the west front calls for no special comment. The windows are all small square-headed two lights, with semi-arched heads, and are glazed with small diamond panes.

The lower part seems to have been built or restored at the same time as the tower, and the upper floor was probably added or rebuilt by Sir William Selby about 1592. It is

possible, however, that the room at the north end of the upper floor was in existence at an earlier date.

The north end of the wall facing the quadrangle displays two very narrow, almost lancet, windows, with plain hollow mouldings and pointed heads, and a pointed doorway with chamfered jambs and arch, and it is possible that this portion belongs to and is the only remaining part of, the original manor house.

The chief rooms on this side are, on the ground floor, the morning room, long and low, with deeply recessed windows and a fine oak chimney-piece, put in by Major Luard Selby in 1856. Adjoining this is a space, about 15 ft. by 5 ft., supposed to have been a dungeon, entry to which was gained from the first floor of the tower. On the north of the archway is another long low apartment with walls panelled in oak, which, however, is quite modern, having been fitted as recently as 1890.

Over this is the old drawing-room, a magnificent apartment, measuring 40 ft. by 17 ft., the chief feature of which is the remarkably fine carved oak Jacobean chimney-piece put in by Sir William Selby somewhere about 1625. This is an extremely fine piece of work, but the upper portion is somewhat spoiled by being painted and gilded to match the walls, which are hung with old and rare hand-painted Chinese paper, said to be the first specimen of wall-paper used in this country. This is surmounted by a carved and gilded oak frieze bearing the Selby crest at intervals.

The short passage leading to the room is oak-panelled from floor to ceiling. A door leads from this drawing-room to the chapel staircase and chapel, which has been recently reconstructed, but without very materially altering its character and with but slight alteration of the old woodwork. This is a remarkable chamber, measuring 35 ft. by 16 ft. It has a painted waggon-wheel ceiling, the ribs and interstices being covered with the arms and emblems of Royalty. The side next the quadrangle is carried on oak supports, and an oak arcade encloses a small conservatory. The north-east corner of the house is apparently of about the same date as the chapel, from which it is separated by a priest's room and vestry.

The crypt or cellar has a vaulted ceiling of the usual thirteenth or fourteenth century type. It is a small chamber 19 ft. by 12 ft., and is about 8 ft. high at the intersection of the ribs. It is constructed of Kentish rag and chalk, and is lighted by a two-light window corresponding to the work of that period. It carries a room which was the chapel of that date, in the west wall of which is a Decorated squint, and in which there is also

INTERIOR OF ST. PETER'S CHURCH, IGHTHAM.

a doorway similar in style and moulding to the east doorway of the hall below; it communicates with a series of rooms which have been considerably altered.

Adjoining this chapel are two rooms of which the gable ends facing the quadrangle exhibit some fine examples of sixteenth century openwork barge-boards.

Contiguous to these rooms, but detached from the outside wall, is the hall, built about 1340 or 1345 by Sir Thomas Cawne. This apartment is 30 ft. by 20 ft., and nearly 35 ft. high. The roof is carried partly by a stone arch and partly by curved timber principals at each end. These arches are similarly moulded and are supported, each in their own material, by corbels representing grotesque human figures. The walls are oak panelled, but this is modern, having been carried out by Mr. Norman Shaw in 1872. The fireplace is fifteenth century, as is also the five-light window. A very beautiful two-light transomed Decorated window on the east side was only discovered and reopened when the oak panelling was being put up.

The lower floor of the south front is in the same style as the west front excepting the kitchen, which corresponds to the crypt, but the whole of the upper floor overhangs and is of a later date, probably Elizabethan.

The library is on this side. It is a long low room, the special feature of which is the handsome carved oak chimney-piece, put in by the late Major Luard Selby.

The remaining portions of the house call for no special description, though every particle is of extreme interest.

which access might be obtained to the upper rooms. The gables of the west front are finished with sixteenth-century openwork barge-boards, of which, however, only those of the northern one are original, the others being modern restorations.

The present owner, A. E. Coombe, Esq., while adapting the building to present-day requirements, has been most careful to retain its old-world charm.

Ightham Church.

Ightham Church, which is dedicated to St. Peter, is typical of the period. The main portion is fifteenth century, but the chancel is certainly very much older, most probably early twelfth century. It has a square embattled tower containing six bells, the tenor one of which weighs 9 cwt.

It is mentioned in Domesday Book in 1080, and was formerly charged ninepence Chrim rent by the Mother Church of the Diocese of Rochester. In the reign of Edward I. its value was given as 20 marks. Hasted says that the patronage of the benefice was always an appendage of the Manor of Ightham, but in recent years the advowson has been the property of the rector.

In the porch is a list of patrons and rectors dating back to the year 1232, which gives some interesting particulars of a rector who was expelled at the time of the Commonwealth.

There are also particulars of several benefactions, one of which, granted in 1546 by one Henry Peyrse, is rather

IGHTHAM MOTE.—NORTH-EAST CORNER OF QUADRANGLE.

Opposite the west front is a picturesque range of sixteenth century cottages, which are said to have formed part of an outer quadrangle, chiefly of stable buildings, that in their day were of sufficient size to accommodate 300 horses with the necessary attendants.

Taken in its entirety Ightham Mote is a charming place, a veritable gem, unique in itself and in its setting, and for a house of this style possibly unexcelled in this or any other country.

The Town House, Ightham.

The Town House is situated at the extreme north end of the village, the grounds adjoining the church.

It is a well-preserved example of a fifteenth-century dwelling-house, and, although still of considerable size, is thought by some authorities to be a part only of what was at one time a much more imposing building.

The main entrance is directly off the roadway, under a porch with a descent of one or two steps into the hall. This is a fairly spacious apartment, and has a good timbered roof and fifteenth-century fireplace.

In the north-west corner is an arched doorway leading to what is now the drawing-room, similar in character to the hall. It has a very fine window with trefoil oak mouldings inside and out, and a good fireplace, the proportion of which, however, is somewhat spoiled in consequence of the floor level having been lowered. There is also another window upon the west side displaying some interesting stained glass, which is modern. A rather curious break (now filled in) occurs in the timbering of the ceiling, a large square space having been left, possibly for a trap-door through

quaint. That gentleman, by his will, made gift of 6s. 8d., together with 2s. for the churchwardens, to be distributed to the poor, more especially those on their way to Canterbury, at the rate of 2d. per person, on the Friday preceding Mid-Lent Sunday in each year. This sum was to be charged against the rent of his mansion in Ightham Street (now the George and Dragon Hotel). This gift is still disbursed upon the day named by the churchwardens standing outside the hotel, but pilgrims now being somewhat rare aves, the monies are mainly collected by the village children and expended not on food, but sweets.

In 1552 the sum of 18s. 9d. was expended upon a new door and 20d. on the lock thereto, both of which are still in use. At the same date 2s. was spent upon whitening and cleaning the edifice.

In the nave and north aisle are several brasses to the Multon and Lambard families. There is also a window to the memory of the family of James Evelyn, but the principal monumental treasures are the tombs of Sir Thomas Cawne or Couen, Sir William Selby and his nephew, and the wife of the latter. That of Sir Thomas Cawne, on the north side of the chancel, is of Caen stone, and represents that nobleman in full armour; above is a window made by his request, and for the cost of which he left 20 lira in his will. At one time this is said to have been glazed with stained glass, and in the top part were displayed the arms of Cawne and his wife Lora, née Morant (a daughter of Sir Thomas Morant of Morant Court, Chevening). This, for some unexplained reason, has been removed, and the window now contains merely diamond panes.

TOMBS OF SIR WILLIAM SELBY AND NEPHEW,
IGHTHAM CHURCH.

On the south side are monuments to the Selby family, two fine effigies of Sir William Selby and his nephew, both residents at The Mote. The top figure is embellished in colours and gold. The lower one represents the husband of the famous Dame Dorothy, whose tomb and memorial is immediately adjoining, on the right-hand side of the altar.

IGHTHAM MOTE.—EASTERN SIDE.

This monument shows the half-length portrait figure of the worthy lady in an oval frame-like recess. Behind the sculpture, moulded in relief, is depicted the life of Adam and Eve in Paradise and their expulsion therefrom. Beneath this is a representation of the Pope in solemn conclave with his cardinals, apparently giving directions to Guy Fawkes. There is also shown two ships, supposed to be sailing to England, and the Houses of Parliament in London with the vaulted cellars stacked with faggots and barrels.

This pictorial sculpture evidently alludes to the tradition which says that it was Dame Dorothy Selby who either wrote or interpreted the mysterious letter received by Lord Monteagle, giving him warning of the terrible Gunpowder Plot. How this story became woven round Dame Dorothy is somewhat difficult to account for, it being almost universally accepted by historians that it was the nervous and shifty Sir Francis Tresham, of Rushton Hall, Northamptonshire, who was the informer. However, it is clear that at the time of her death in 1641 general belief was that the Dame had some hand in disclosing the conspiracy.

Immediately beneath the bust is the following inscription:—

D. D. D.

To the precious name and honour of Dame Dorothy Selby.

She was a Dorcas

Whose curious needle turned the abused stage

Of this lewd world into the golden age,

Whose pen of steele, and silken inke enrolled

The acts of Jonah in records of gold:

Whose arts disclosed that plot, which had it taken

Rome had triumphed, and Britain's walls had shaken.

She was in heart a Lydia, and in tongue a Hannah,

In zeal a Ruth, in wedlock a Susannah,

Prudently simple, providently wary,

To the World a Martha and to Heaven a Mary.

Who put on immortality in the year } of her pilgrimage 69,
of her Redeemer 1641.

The church seems at various times to have undergone very extensive alterations, notably in 1550 and 1552, and again in 1639. It was considerably restored in 1850, and again in 1881, when the two galleries at the western end were removed, being considered unsafe, and only quite recently the fine timbered roof has been unceiled and now shows the original oak beams, some of which are beautifully carved and moulded.

In bringing this paper to a close I desire to express my thanks to Mr. Frank Spiers, Mr. T. Pitt and Mr. Alfred Burch for their kind assistance, and to acknowledge my indebtedness to *The Builder* for particulars gleaned therefrom, and also to the archæological and historical writers referring to the places herein briefly surveyed.

THE HYGIENIC ASPECTS OF GAS FOR HEATING AND LIGHTING.*

FROM the earliest days in which it was realised that there was an atmosphere around us, it has proved itself not only a happy hunting-ground for the investigator, but also a battlefield for the scientists of all periods. Three hundred and sixty years before the birth of Christ, Aristotle, noticing the work which air in motion would do, came to the conclusion that it must have weight, and attempted to ascertain if this were so by weighing an ox-bladder from which all air had been expelled, blowing it full of air, and again weighing it, when his scales showed a slight increase. No sooner, however, had his experiment been made public than Simplicius at once pointed out that Aristotle had used the air from his lungs, and that if ordinary air was pumped in from a bellows no increase in weight took place. The controversy was the first and the last for twenty centuries, and it was not until Galileo, in the middle of the seventeenth century, made his celebrated experiment of compressing air into a glass globe that the weight of the atmosphere was established.

CONSTITUENTS OF AIR.

Many other physical discoveries with regard to the air were made in the following century; but it was not until 1774 that the combined labours of that trinity of genius, Priestley, Cavendish and Lavoisier, showed that air was not an element, as had always been supposed, but was, in fact, a mixture of the two great elementary gases, oxygen and

* A Paper by Professor Vivian B. Lewes, F.O.S., F.I.C., read on October 8 at Manchester before the British Commercial Gas Association.

nitrogen. It was at this period that Cavendish, devising processes for the purpose, first determined its composition, and found it apparently so unalterable that he came to the conclusion that it must be a compound; while others inclined to the belief that it was merely a mixture. It was then that the brilliant experiments of Lavoisier, on the influence of oxygen upon combustion, led to the idea that it was the percentage of oxygen present that was really the criterion of a good or bad air, while Priestley showed that growing vegetation under the influence of the sun's rays gave off oxygen. Later it was discovered that gases did not behave towards gravity in the same way as other bodies, and could not be arranged in layers, but that when a light gas was superimposed upon a heavy one the two quickly mingled. Graham, that great Master of the Mint, in the middle of the last century, having experimentally determined the rate at which intermingling of the gases took place, enunciated his celebrated Law of Diffusion.

The presence of carbon dioxide in the air had been ascertained at much the same time as the discovery of its composition, and, further, it had been shown that the carbon dioxide given off during respiration, and by all processes of combustion in which carbonaceous material was used, was absorbed by plant life, the carbon being used to form the woody fibres and cells of the growing plant, while the oxygen escaped free to revivify the air. As soon as this had been accepted, carbon dioxide was substituted for oxygen as the factor which influenced the health-giving properties or otherwise of the air.

THE CARBON DIOXIDE BOGEY.

At a somewhat later period, however, doubts began to be raised as to the injurious effect of carbon dioxide, and the statements of Sequard and D'Arsonval pointed to the fact that it was rather the organic matter which always accompanied the carbon dioxide when evolved by processes of life that really was the injurious factor in an unventilated space, and chemical purity began to occupy the important place in the mind of the ventilating engineer. It was found, however, that the organic matter in the air was extremely difficult to estimate, and, as it was always accompanied by carbon dioxide, the quantity of which could be determined readily and easily, the amount of carbon dioxide in the air was taken as the measure of its purity, not because it was itself injurious, but because, when generated by respiration or evolved through the skin, deleterious organic matter accompanied it. Pettenkofer and other observers, having made analyses of air from all parts of the world and under all conditions, found that it was always present, and existed to the extent of 0.03 to 0.04 per cent. in good air, and the sanitary authorities from these facts fixed as the limit in the air of confined spaces 0.06 per cent. of carbon dioxide as being the amount to which it can be raised without injuring health when the carbon dioxide had been produced from life.

This last saving clause, however, was nearly always overlooked, and carbon dioxide has for the past thirty years been regarded as a more or less dangerous impurity by those who did not grasp the fact that it was merely the surehead for the organic matter that accompanied it under special conditions. A large number of observers traversed the organic matter theory, and came to the conclusion that the exhalations of a healthy subject contained no poisonous matter, while at the end of the last century Kruger advanced the theory that the effect on health produced by want of ventilation was due to heat and moisture. Flügge, in 1905, came to the conclusion that temperature was the only factor that had any hygienic effect, and the health would be maintained, no matter how bad the ventilation, if the temperature of a room in which people were working did not rise above 65° Fahr., or for an ordinary living-room above 70° Fahr.

HEALTHY CONDITIONS OF INDOOR ATMOSPHERE.

Great as were these changes in opinion as to what really constituted healthy conditions of indoor atmosphere, but little attention was paid to them in England until Dr. Haldane confirmed the fact that the organic matters thrown off from the lungs and the skin of healthy people are not deleterious to health, although, consisting as they do of germs and bacteria which easily undergo decomposition, they quickly give air a sour and unpleasant smell. Dr. Haldane and Dr. Leonard Hill have also demonstrated that the carbon dioxide, even when present in such enormously increased quantities as 3 to 4 per cent., has no effect except

to deepen the breathing, while with 6 per cent. it begins to produce headaches, palpitations, sweating and distress, and with 11 to 12 per cent. coma sets in, but does not quickly destroy life. They have also demonstrated that the oxygen in the air may be reduced to 17.5 per cent. without interfering with the ordinary functions of life, and that, in point of fact, the discomfort and oppression caused in badly-ventilated rooms have nothing to do with the chemical composition of the air. So that to-day our views on ventilation are in a condition of active change, and we are coming to the conclusion that the percentages of oxygen and carbon dioxide within the limits of the quantity found in the worst ventilated rooms are immaterial, and health is dependent upon temperature, moisture, and movement of air, the latter being one of the most important factors.

The old phase of thought and knowledge with regard to our views on ventilation, which future generations may justly call the "chemical quality era," is fast passing away, and the idea that the percentage of carbon dioxide may be taken as the criterion of the effect of the air of a room on health would soon be as dead as the percentage of oxygen standard if it were not for the fact that accepted theories die hard, and that it is to the interest of some to keep the carbon dioxide skeleton dancing on its stick. The ease, however, with which carbon dioxide can be estimated makes it a valuable indicator, and as long as it is recognised that it is merely an index and not an active factor in destroying health, its presence will be taken advantage of in tracing air movements.

MISTAKEN IDEAS.

There is no phase of the subject of ventilation that has received more attention, has been more dogmatised about, or more misrepresented than the effect of artificial illuminants on the air of confined spaces. When electric lighting first became popular, the two great features that appealed to the public were that it was more convenient to press down a switch than to find a match, turn on the tap, and light the gas, and, secondly, that as it abstracted nothing from the air and added nothing to it, electric light must be more healthful in a confined space.

THE STERILISING QUALITIES OF GAS.

I remember well the first doubt that ever crossed my mind arose when lecturing in a well-known London hall, in which I had given many lectures before when it was lighted by gas sun-burners, and had never felt any oppression. On this occasion, however, the hall had just blossomed out in the full glory of electric light, and I felt it unpleasantly stuffy, while two of the audience felt faint and had to be taken out. In consequence of this, I made some experiments in a room having a capacity of 2,700 cubic feet, and obtained the totally (to me) unexpected result that when the room was lighted by two Welsbach "C" burners and mantles on a pendant, each consuming 4 cubic feet of gas per hour, the air at the breathing level in the room was far purer and fresher than when three 16-candle incandescent electric lamps were used, and that the result became the more markedly in favour of gas the larger the number of people in the room.

Further experiment showed that the cause of this unexpected phenomenon was that the strong uprush of heated products of combustion from the gas-burners drew up the emanations from the skin and lungs of the occupants, charred and sterilised any germs that accompanied them, and, reaching the ceiling at a temperature of 12° higher than when electric light was employed, diffused through the plaster so rapidly as to draw fresh air into the lower portion and create a brisk draught under the door of the room, and, while so diffusing, filtered off the charred remains of germs and organic matter on the white washed ceiling, thus giving the blackened area which always occurs on the ceiling above the gas light in town air, and marks the beneficent work of sterilisation that the gas-flame is carrying on, and not, as the advocate of electric light always insists, imperfect combustion.

PURIFYING PROPERTIES OF WHITEWASH.

Soon after these experiments had been made, Sir George Livesey commenced his celebrated attack upon the sulphur clauses, and, in order to prove his contention that lime purification was not essential for a domestic gas supply, took a small house near the Old Kent Road, in which Dr. Ott. Hehner and Dr. Rideal made a long research upon the influence of the sulphur in the gas upon the air of the rooms

if iron purification only replaced the previous methods. These investigators found that it made no difference to the air of the room whether lime purification had been used or not; but the most startling fact was that, after burning large quantities of the gas in small rooms with the grate, doors and windows closed, they found no more sulphur acids in the air of the room than in the atmosphere outside the house, and often less. The explanation of these facts was that the plaster and whitewash of the ceiling and walls consisted largely of calcium carbonate, and that, as the heated products of combustion escaped through them by diffusion, the sulphur acids became fixed as sulphates and sulphites of calcium, while the portion that got cooled below the temperature necessary for rapid diffusion was to a certain extent absorbed by contact with the whitewashed ceiling. As the rooms were made as air-tight as possible, the exterior air that entered to take the place of the heated products had to pass in through the plaster, and so underwent a purification that led to the sulphur in the room being sometimes less than in the open air. A convincing proof that this was the true explanation was found by varnishing the ceiling and walls, when the sulphur acids in the air increased pro rata with the amount of sulphur in the gas.

GAS AND AIR MOTION.

Following up the subject, Dr. S. Rideal made an exhaustive research upon the "Relative Hygienic Value of Gas and Electric Lighting," which was published in the "Journal of the Royal Sanitary Institute" in 1908, and from which he came to the conclusion that "owing to the better ventilation obtained by gas, the products of combustion are not found in the air in anything like the proportion which might be expected—the temperature and humidity in an occupied room being no greater than when the room is lit with electric light." Since these facts were first published, many experiments of this character have been made, both in this country and abroad; but as far as I know not one iota of rebutting evidence has been forthcoming—all the results showing beyond doubt the importance of the heat given by the combustion of the gas in setting air in motion, promoting diffusion, and, over a given period, drawing in fresh air in so much larger a ratio than it gives off polluting products that the air in the breathing zone of a closed room is purer than with electric light, which gives off no products, but has a smaller influence in creating motion of the air.

Dr. Leonard Hill, who has devoted his life to a study of the hygienics of the body, in this year's Presidential address to the Physiological Section of the British Association, defined the conditions essential to any good system of ventilation as being: (1) Movement, coolness, and proper degree of relative moisture in the air. (2) Reduction of the mass influence of pathogenic bacteria. A stagnant atmosphere is perhaps the worst enemy to health. The body is as dependent upon the action of the skin as upon the lungs for throwing off the waste products of life, and in an hour evaporation gets rid of some 700 grains of moisture from the skin and lungs. If the air is stagnant and still, the moisture-laden emanations from the body are entangled by the clothes, and a humid layer of foul air hinders further evaporation, throwing such a strain on the system that a feeling of malaise rapidly arises, while if the air around the body is in motion and sufficiently removed from its saturation point for moisture, this blanketing of the body does not occur, and evaporation continues its beneficent work of throwing off waste products and regulating the body temperature.

Here, then, are two of the most important factors in ventilation—movement of the air to prevent stagnation, and keeping the air sufficiently removed from its saturation point to allow proper action of the skin. As regards air movement, this may be brought about either by the natural method of air currents resulting from difference in weight of volumes of air, or by artificial methods, such as fans or blowers. The grandest illustration of the former is the creation of the trade winds by the uprush of heated and water-saturated air at the tropics, drawing in the cool and heavier air from north and south of those regions, while the overhead currents in an opposite direction that go to restore the balance of aerial pressure feed the rainfall of the northern and southern hemispheres.

If we heat air it expands, becomes lighter than the unheated air, and ascends; while cooler air takes its place, and a current or air movement is produced. Saturate air with water vapour, and as the latter is far lighter than the former, the tendency is again to ascend.

(To be continued.)

ILLUSTRATIONS.

RAVENSHOE, FURZE HILL, SURREY.

THE house stands high on a gently sloping site. Above a plinth of Crowborough bricks, the walls are finished with cement rough-cast uncoloured. The roofs are of dark red hand-made tiles, and the doorway, &c., of Ancaster stone. The drawing, which was in the R.A. Exhibition this year, shows the entrance front, the aspect being north-west. The house has been excellently built by Messrs. J. W. Falkner & Sons, and the architect is Mr. H. P. Burke Downing, F.R.I.B.A., of Westminster.

DESIGN FOR HOUSE, BELVEDERE AVENUE, WIMBLEDON.

THIS house was designed for a site standing 5 or 6 feet above the level of the roadway, and was to be built with 2 inch red brick plinth, cement stuccoed front, with green painted louver shutters, the roof covered with dark Wrotham tiles, the front bay and porch to have swags and ornamentation modelled direct on the spot, the columns being in Portland stone. The estimated cost of this house was about £1,400. The original design, however, was abandoned, and a still larger house has been put up in its stead.

HOUSE AT SLOUGH.

THIS house has been built on a plot of land with 18 feet frontage. Advantage has been taken of widening of the site to develop the plan on broader lines than the small suburban villa, with its narrow passage and straight flight of stairs. The accommodation consists of hall, drawing and dining rooms, kitchen, scullery, and usual offices, three bedrooms on the first floor, bathroom with hot linen cupboard, and w.c., while a fourth room was added while the building was in progress. The lower portion of the exterior is treated in red and purple bricks, with a wide flush mortar joint, while the upper storey is stock brick covered with cement rough-cast.

The oak half-timber is of genuine construction, pinned together with oak pins, with an infilling of brick. Wood casements are used throughout, and all mouldings and details are of the simplest character, while the ground floor throughout is laid with wood blocks.

The contract price was £454, including £15 for contingencies. The room in the roof was put in at an extra cost of £25.

The builder was Mr. H. D. Bowyer, of Slough, and Messrs. Moscrop-Young & Glanfield, Licentiate and A.R.I.B.A., were the architects.

DESIGN FOR COMPLETION OF REGENT STREET QUADRANT.

MR. ERNEST RUNTZ, in forwarding us his design for the completion of Regent Street Quadrant, which we illustrate to-day, sends us an apologia of his views and the influence they have had upon his design.

Mr. Runtz holds that it is impossible to get away from the fact that commercially there must in the treatment of shop premises be as much open space as possible for display of goods on the ground floor, and he refers to the treatment which he adopted at the Norwich Union building, at the corner of St. James's Street, in Piccadilly, where there is a 40-feet span girder, supported at each end on stanchions cloaked by two massive pavilions, which he considers is better than a series of thin props at short intervals, which only offend the eye.

Concerning the masking of steel construction, Mr. Runtz says that everybody knows that steel construction is there, and there is no reason why one should not cloak it over, any more than that a man should not wear a collar and tie to finish off his person; you know the neck is there if you do hide it.

He goes on to say: "One cannot conceive that the Greeks and Romans, had they known of the advantages of steel construction, would not have made use of it for commercial and structural purposes, neither would they, in my opinion, have hesitated to cloak the steel with a more pleasing material, in the same way as they painted the beautiful marble columns and slabs used in their buildings, the natural surfaces of which we so religiously preserve in the present century." We may add that the Romans, at any rate, did bury iron girders in concrete and cover the latter with marble slabs.

In the treatment of his design for Regent Street Quadrant, Mr. Runtz points out that he has set back a mezzanine floor as a sort of gallery, and in his elevation has not departed seriously from the main features of Mr. Norman Shaw's design on the upper floors, but has merely enlarged the window openings, which are set back, and, therefore, have no real effect on the perspective or vista.

HOUSE OF HANOVER—THE GEORGIAN ERA.

(Continued from page 186.)

DURING the opening years of the eighteenth century architecture developed certain common characteristics chiefly based on Palladian principles, combined with features of English origin inherited from the earlier work of Wren. Although Wren did not complete St. Paul's Cathedral until 1710, and was engaged at Hampton Court Palace up to the time of his death there in 1723, we do not find that he was entirely responsible for this new movement. The credit is largely due to Richard Boyle, Earl of Burlington, who may

John Vanbrugh, William Wakefield, William Kent, James Gibbs, Colin Campbell, Isaac Ware, Thomas Ripley, Henry Flitcroft, and Thomas Archer, a pupil of Vanbrugh's. The provinces record important additions in the names of William Smith, of Warwick; John Wood, of Bath; John James, of Eversley (died 1746), and Sir James Burrough, of Cambridge. In Scotland William Adam, the father of the Brothers Adam, had an active practice. He died in 1748, and was the author of "Vitruvius Scoticus," while the descendants of the Mylne family practised in the neighbourhood of Edinburgh.

The first building of importance, Blenheim Palace, Woodstock, Oxfordshire, built for John, Duke of Marlborough, was the principal work of Sir John Vanbrugh, in which he received the assistance of Nicholas Hawksmoor, and probably also of his pupil, John Archer, who at that

DRAWING-ROOM FIREPLACE, LINDSEY HOUSE, CHELSEA.

be said to have created a school and directed the general taste in Classic principles. He was extolled by Gay and Pope for the erection of Burlington House, Piccadilly, where he entertained very largely. Giacomo Leoni was brought by him from Venice to assist in the translation of Palladio's "Architecture," which appeared shortly after the accession of George I. in 1714. A further edition appeared in 1733, dedicated to Lord Burlington, and published by the engraver, Benjamin Cole. On the first page of the letterpress is an engraving of an altarpiece designed by Inigo Jones for the chapel at Old Somerset House. "The Architecture of Leon Battista Alberti" was first published in 1726, being a translation of Alberti's "De re Aedificatoria," by C. Bartoli, with plates by G. Leoni, who also published in 1741 a work on painting and statuary in English and Italian.

The principal architects practising in the first half of the century include, besides those already mentioned, Sir

time, 1705, was engaged on a work of his own—namely, Heythorpe Hall, in the same county.

The many criticisms levelled at the shade of Vanbrugh for this ponderous essay, which commemorates the first Duke's French victories, are merited chiefly by reason of the supposed want of *raison d'être* for much of the monumental nature of the exterior. The building was to be a national monument to house the hero of the Battle of Blenheim, and was to form a permanent expression of England's joy at the suppression of the power of Louis XIV. When Lille, Malplaquet, and Bouchain had been fought and won—the final success being achieved—the Duke returned to his well-earned rest, spending the remaining four years of his life at Woodstock, where he died in 1716. Sarah, his Duchess, lost no time in superseding the architect, Vanbrugh, who from this time ceased to visit the works, although some of his designs appear to have been carried out. Ex-

cepting, however, where the decorations are structural, they are mostly of later date. The three principal State rooms are, curiously enough, in the Régence style, as practised by Verberckt and Rousseau in the Cabinet du Conseil at Versailles. The tapestries and paintings here represent many of the battle scenes in which Marlborough, Cadogan and Armstrong figure prominently.

Laguerre was responsible for the painting of the saloon, and the ceiling of the hall is by Thornhill, while Kneller and Duran are represented by portraits of the Duke and Duchess, which respectively occupy positions over the mantels of the third and first State rooms, the second State room being known as the "Bouchain" room.

Charles Spencer, the second Duke of Marlborough, housed his valuable library in the Long Gallery in 1749, the room receiving subsequent decorations, probably from the designs of Sir William Chambers during the residence of George, the third Duke. The monument in the chapel is from the chisel of Rysbrack.

Stowe House, Buckinghamshire, was built for Richard Temple, Lord Cobham, by Sir John Vanbrugh in 1714. It is a finer work than Blenheim Palace, but has within a certain redundancy which is not a little overpowering, particularly as regards the dining-room, where, however, some fine tapestries and two good chimney-pieces are redeeming features. The designs of these latter, though attributed to Grinling Gibbons, are more of the character and style of William Kent. Kent was employed with Bridgman on the gardens, where also "Capability" Brown first learnt to use the hoe, and eventually rose to be Lord Cobham's head-gardener. Kent was responsible for the ceiling in the vestibule. The hall, which is treated constructionally, contains a carved processional frieze from the chisel of Valdré. The music-room appears to have received the attention of Robert Adam in the English Empire style so much in vogue towards the latter years of the century. In the chapel are carvings by Grinling Gibbons and Michael Clarke, with some cedar panelling brought from Sir Richard Grenville's residence, Kilhampton, Cornwall. The library, which contains some valuable MSS., was decorated by Sir John Soane in 1805.

Oulton Hall, Cheshire, is a quiet brick and stone structure attributed by Murray to Vanbrugh. There is none of the colossal grandeur of Blenheim, nor yet the dignity of Stowe, in the general treatment of the façades, which rather savour of the reputed Wren manner. The entrance hall is vaulted, and the enriched entablature is much broken by reason of subsidiary Corinthian pilasters. The swags and other ornament give just sufficient relief to form a simple decorative scheme. The room is painted white throughout, except for the polished hardwood doors. The dining-room is panelled to the ceiling, with a fluted Ionic order supporting an entablature with pulvinated frieze. The niche between two of these pilasters contains at the head a large carved shell, which is typical of the prevailing style. The door architrave is of the swelled ogee type usual in the later work of Wren, only without plinth blocks; the mouldings to the stiles of the doors are worked out of the solid, unlike the panels to the walls, which have bolection mouldings, the panels themselves in both instances being fielded.

Some of the smaller reception-rooms are treated in a very simple manner, with less elaboration than obtains in the saloons. The house was rebuilt by John Egerton in the early years of the century upon a more elevated site than that occupied by his ancestors, whose ownership dates back many generations. Some alterations were effected by Lewis Wyatt in the reign of George IV.

Duncombe Park, Yorkshire (the "Helmsley" of Pope), had been the seat of George Villiers, Duke of Buckingham, prior to its purchase in 1695 by Sir Charles Duncombe, who became Lord Mayor in 1708. Duncombe owned Downton, in Wiltshire, and a house at Teddington in addition, which were both decorated at much expense, the latter being favoured with the brush of Verrio prior to his death in 1707, and also with the chisel of Grinling Gibbons. Although Duncombe died in 1711, the building was not completed until 1718, from the designs of William Wakefield. A fire in 1879 unfortunately did much damage, necessitating subsequent redecoration. The stone-cased hall is a small but noble apartment, with lofty fluted Corinthian columns of bold projection attached to the walls, supporting an entablature with carved frieze of oak leaf and acorn ornament. The saloon is somewhat gaudily finished, but withal a handsome apartment, its gilt splendour being doubtless due to the above-mentioned restoration.

(To be continued.)

THE DOMESTIC ARCHITECTURE OF EGYPT DURING THE FIRST DYNASTY (B.C. 5500).

By CLAIRE GAUDET.

THIS year the greatest interest is attached to the discoveries made by Professor Flinders Petrie in the large cemetery of Tarkhan, thirty-five miles south of Cairo, where burials dating from before the First Dynasty, or Dynasty 0, as it is called, to Dynasty IV., have thrown invaluable light upon domestic architecture 7,400 years ago. The work at Memphis, which has yielded most interesting monuments, has, however, been eclipsed by the digging at Tarkhan.

For some time the Professor had come to the conclusion that the recessed panel pattern so frequently seen in early decoration carved in stone was of a timber and domestic origin, since it had no structural significance in brick or masonry, but in timber planks is easily explained. These conclusions had been founded upon the designs on the sarcophagus of Khu-fu-aukh in the Cairo Museum, and on the coffin of Nekht-anekh, the tomb of Methen and others, and now at Tarkhan coffins have been discovered which clearly prove these theories to have been correct.

The sarcophagus of Khu-fu-aukh represents a house, in the centre of which is the door lying back, with the panels overlapping. To judge from the width of the door panel, the main angle planks were the width of a whole tree. On either side of the entrance, again, the same design is followed, the third overlapping plank remaining forward and free, the recessing beginning again and imitating a small false opening. When this pattern is rendered in brick or stone, as seen in the false doors of tombs, &c., the recessing becomes much deeper, owing to the nature of the material. The upper storey of the house, as seen on the sarcophagus, has triangular windows. The roof is supported on poles, which are half trees, and present their circular portion, the arrangement resembling diminutive "stockading." The coffins which were found are made of thick planks of wood; in the planks are holes about two inches long by half an inch wide, recurring at measured intervals. The wood obviously had served an earlier purpose; some show signs of fire on the inside, the outside being weathered. These planks are, therefore, none other than the timbers of the houses or perhaps even timbers taken from the very house of the occupant of the coffin.

In the example which showed a charred surface, doubtless the house had been burnt down and the coffin made of the remaining pieces.

The recurring holes denote where the boards were lashed together with leather thongs, each plank overlapping the other. In Professor Petrie's next book the system of construction is clearly set forth. The lashing together gave ample "play" to the wood to swell or contract, according to the season, and any gaps caused by contraction could be wedged up from behind.

This mode of construction also rendered the houses easy of transport; they could occupy the plains, where it is ten degrees cooler from December to June, and could then be removed to the desert.

The coffin shown in the photograph dates from the Third Dynasty, and is a rude representation of a house with two openings, used decoratively, the number of openings apparently having no definite significance. The usual "roll," or "log," is seen over the lintel. In earliest times this roll was a bundle of reeds covered with mud; its next stage was a wooden log, and, lastly, we see it retained in stone. The roof is curved.

The other objects discovered were wonderfully well preserved. Rolls of linen, soft and white and of a beautiful texture unknown to us to-day, were found in the tombs or entwined round the bones, from which all the flesh had carefully been removed previous to burial. In pre-dynastic times (B.C. 7500 to 5500) bodies were mutilated in order to prevent the soul from returning, lest it should take the food that was needed for the living. But in the Fourth Dynasty the belief changed, and life eternal in the Other World was held to depend upon the preservation of the body in this. Dr. Wallis Budge tells us: "The Egyptian of the Fourth Dynasty (1) wished the souls of the dead to enjoy everlasting life. (2) He wished to maintain a dwelling place for the 'Kau' or 'doubles' of the dead, so that they might not be obliged to wander about in the deserts in search of food. (3) He wished the dead to form a bond of union between the gods and himself. (4) He believed that the soul came back to the body from time to time. (5) He believed in the resurrection of the material body itself, and that at some future time it would be united to its soul for all eternity."

These beliefs in the necessity of the mummification of the

body (dating from the Fourth Dynasty, 4700 B.C.) obtained right down to Christian times amongst the ordinary folk.

In regard to the *Ka*, or double, we are told that it was that part of the soul of a man which from birth to death was his "abstract individuality" or "personality"; the word is also translated by "double, genius, image, character, person, self." Associated with the *Ka* was the *Ba*, which was believed to be everlasting, and to enjoy eternal existence in Heaven in a state of glory. But for the *Ka* provision had to be made at the death of the man; sometimes a statue was carved in his image, which the *Ka* might inhabit should it be pleased so to do.

This, then, is the origin of the food-offerings, altars, and furniture found in the tombs.

Some pre-dynastic bed-frames in wonderful preservation, with the rush-work webbing still attached, were found at Tarkhan. Sometimes the body was laid upon them, but others were found placed over the body. Some are full-length beds for sleeping, some shorter, and some square for sitting on cross-legged. Five different types of jointing were found in the poles of the beds. The legs are carved to resemble bull's feet, similar to models in ivory found in the Royal tombs of the First Dynasty.

A later development of the provision made for the *Ka*, and one of the utmost importance as again showing the

of the little models. The earlier examples have flat roofs, but the later show even to the ribbing of the brickwork arches. In another model the ground floor is roofed with a barrel vault.

One example clearly shows the use of the segmental arch for strength (as used in Roman times) on the ground floor, with the complete semicircular arch on the storey above. The true or radiating arch in brick was used in Egypt as far back as the Third Dynasty, when the curved roof was also represented in stone. In another "soul-house," where a flat roof is seen, the floor of the upper storey rests upon a strong beam, apparently unsupported by any columns below.

The columns in the actual houses of the peasantry, from which these little "soul-houses" are held to be copied, were doubtless of reeds and mud, to judge from the bulging appearance seen in the models; these, then, were survivals of the true prototypes of the Egyptian column, and no doubt continued in use long after they had found expression in stone.

In the forecourt of the house was the square water-tank, with its channel left open. The tank was protected from the rays of the sun by an awning held in position by four posts; all these details are to be seen in the little clay models.

The lower chambers were ventilated from the roof by large

domestic architecture of the period, is seen in the "soul-houses," which were discovered at Rifeh in 1907, of which 150 examples were found. These are little clay models of houses placed on the open ground over the graves. That the cemetery of Rifeh should have yielded so many is due to the fact of its being situated on a growing shoal of gravel, which continued to grow, and in time covered up the little models, which were buried from twenty to twenty-five inches below the present surface. The cemetery is certainly as old as the Eleventh, and may even date back to the Seventh or Tenth Dynasties.

These little models show one or two storeyed houses oblong on plan, with an enclosure in front. They all have a portico with two or four columns, and usually an outside flying stairway leading to the roof and upper chambers.

The walls were of mud and brick, and were colour-washed with red bands, for the colour is still visible in some cases. In later examples the walls are "serrated," or "crested," at the top, and it is curious that the tombs of the modern cemetery close by still retain the custom.

The windows of the lower floor were placed high up and barred for protection, as seen by the cross-bars on some

hooded openings called "mulgafs," which caught the wind and carried it down. The furniture in the later examples is seen in the bed, chair, corn-bin, &c.; even the figure of the woman grinding the corn under the stairs appears to have become a part of it. Thus we are carried by these little bits of clay right back into the domestic life of the Egyptian of the Tenth or Eleventh Dynasty, or even perhaps earlier.

To return to this year's exploration and wonderful discoveries, Tarkhan was evidently the cemetery of a city of considerable importance, probably the northern capital of a dynastic race before Mena, the founder of Memphis (First Dynasty, 5500 B.C.), but the city must have declined under the early Pyramid kings (B.C. 4700).

The cemetery, which is situated near the station of Kafr-Amman, covers about a mile length of desert, and is also quite close to Medum, where in former times Professor Petrie had hoped to find a "beginning of things" in the Fourth Dynasty, but was disappointed to discover an already advanced architecture in the small but complete temple built by Seneferu, the first king of the Fourth Dynasty.

Medum has its own cemetery, and would appear to date from the decline of the, as yet, unfound capital.

Nine hundred forms of pottery, hand-made, were discovered, dating from 7500 B.C. to 5500 B.C. The alabaster and basalt bowls and jars which were seen at University College were ground into shape by hand, and not by turning. To enumerate one-half of the wonderful things discovered is impossible, but mention must be made of the great alabas-

ter sphinx which was found at Memphis lying between the two great colossi. It is in perfect preservation, although overturned, in which position it was discovered; but next year it will be set up on its base. It dates from the Eighteenth or Nineteenth Dynasty, and measures 26 feet long by 14 feet high, and weighs about eighty tons.

Another sphinx and a group representing Rameses II. and the god Ptah, all in red granite, were also found at Memphis, which is in charge of Mr. M'Kay.

These discoveries, and the positions in which they were found, all prove Herodotos' statement in regard to the temple, its monuments and builders, to have been absolutely correct. The Ptah and Rameses group has been sent direct to Copenhagen, as it is that country, and not England, that is financing the excavations at Memphis.

MR. P. BRYANT BAKER, of Chelsea, has been commissioned by the King Edward VII. Middlesex Memorial Committee to execute the white marble bust of his late Majesty proposed to be placed in the Middlesex County Hall at Westminster. Mr. Baker was selected out of nine competitors, and his remuneration will be 350 guineas.

THE SOCIETY OF ENGINEERS.

A MEETING of the Society of Engineers (Incorporated) was held at the Institution of Electrical Engineers, Victoria Embankment, W.C., on Monday, October 7. Mr. John Kennedy, president, occupied the chair. After some preliminary business, Mr. E. R. Mathews, A.M.Inst.C.E., F.G.S., read a paper on

Town Planning from an Engineering Aspect.

The architectural aspect of town planning has been, said Mr. Mathews, much discussed of late, but from an engineering standpoint the subject has had less attention. It is easier to regard the matter from the former point of view, for a mere reference to town planning raises in one's mind such questions as whether the houses are to be 12 or 40 to the acre; are to be set back 10 or 30 feet; are to be detached, semi-detached, or in terraces; whether some portion of the area to be laid out shall be reserved for large residences, other portions for workmen's dwellings and bungalows, others for shops, and a further area for factories; or whether the two latter are to be kept out of the area entirely.

At Ruislip-Northwood the town-planning area is divided up as follows:—

$\frac{1}{4}$	of site area to be occupied only by bungalows.
$\frac{1}{2}$	" " " " " shops.
$\frac{1}{4}$	" " " " " ordinary dwellings.
	houses and larger residences.

The provision of open spaces for parks and recreation grounds, and of sites for public buildings, monuments, &c., all affect the architectural aspect of the subject; but from an engineering point of view many other important matters have to be considered. As town planning in a residential district is very different from that in a manufacturing centre, it is well to consider the two cases separately.

(A) TOWN PLANNING IN A RESIDENTIAL DISTRICT.

The town-planning scheme prepared by the author for the Bridlington Corporation was one affecting a purely residential area. In preparing such a scheme the first matter to be dealt with is to fix the area to be planned. A knowledge of local conditions and requirements is absolutely necessary in deciding this; and those parts of the town in which building operations are likely to proceed most rapidly should be included in the area.

This area having been decided upon, and the Local Government Board's sanction to prepare a scheme for such area having been obtained, the next point to receive consideration should be the direction, width, and method of construction of the various roads.

(1) *Main Arterial Roads.*—At the outset the direction of the through-traffic roads should be fixed, and these should be in such a position that direct means of communication will be provided between one busy part of the town and another, or they should connect up important existing roads. The position of most roads will be determined by the best direction for main and intercepting sewers, and this is a matter for the decision of the engineer. The author strongly urges that none of such roads should be less than 75 feet in width, and that they should be constructed of tar macadam in order to ensure a minimum of dust and noise. The footpaths should be of asphalt, the road should be provided with grass margins and trees, and the author recommends that the houses be set back 25 feet, making a total distance between the buildings of 125 feet.

A brief description of such a road is as follows:—

Width of carriageway	35 feet.
Width of footways	10 feet.
Width of grass margins	10 feet.

Such a road is of sufficient width to take a single line of trams in crowded parts and a double line on the outskirts.

The author suggested the following method of construction:—

Foundation.—The sub-foundation having been carefully prepared and shaped to the finished profile, the foundation should then be laid; this may consist of hand-packed rubble stone, preferably sandstone, or (as at Bridlington) of brick-bats well rolled in with a 10-ton steam roller. In the case of a rubble stone foundation a thickness of 9 inches will probably be sufficient; these stones will be laid on edge, and will vary in length from 6 to 9 inches and in thickness from 4 to 6 inches and be laid lengthways across the street. After the rubble stone has been carefully laid, it should be "blinded" with broken bricks, broken concrete, or broken stone so as to fill up the spaces between the stones. A 10-ton steam roller should then be applied, the road being well watered, until an even surface is obtained. Where

a brick-bat foundation is used, the author's practice has been to make the depth 12 inches after rolling.

Tar Macadam.—The stone for this may be limestone or one of the softer kinds of granite. The author has found Scotch granite to be admirable for this purpose, and has used it very considerably for tar macadam, greatly preferring it to limestone, after several years' experience with the latter. The stone should be in three sizes, and as regards the relative quantity of each size the author concurred with the suggestion made by Mr. John S. Brodie, M.Inst.C.E., the borough engineer of Blackpool, as follows:—

60 per cent. $2\frac{1}{2}$ inches.
30 " " from $2\frac{1}{2}$ inches to $1\frac{1}{2}$ inches.
10 " " " " " " $\frac{3}{4}$ " " $\frac{1}{2}$ " "
All below $\frac{1}{2}$ inch being discarded.

The tar macadam should be laid and rolled in separate layers, being rolled first with a 6-ton, and afterwards with a 10-ton steam roller. The author suggested a total thickness of 6 inches of metal after rolling.

The metal should be thoroughly dried, and all dust removed before mixing with the tar, which should have a temperature of about 260° . The author has usually had the mixing done by hand, but there are many excellent mechanical mixers in the market, and he would recommend the use of these. The estimated cost of constructing such a road at Bridlington, with brick-bat foundation, would be £4 13s. 8d. per lineal yard of roadway, including footpaths, grass margins, and tree planting.

(1a) **Secondary Roads.**—The secondary roads, which are important roads not carrying through traffic, might be 50 feet in width, constructed like the arterial roads, of tar macadam. The set-back of the houses in these roads might also be 25 feet, and the distance between buildings would be 90 feet.

Width of carriageway 24 feet.
Width of footways 7 feet.
Width of grass margins 6 feet.

A road of this width will allow three lines of vehicles passing. The estimated cost of such a road would be £3 9s. 9d. per lineal yard.

(1b) **Subsidiary Roads.**—These are roads which carry practically no traffic except vehicles coming to the houses in such roads. Under these circumstances they need only be very narrow, say 28 or 30 feet, with the houses set back 20 feet. These also, in the author's opinion, should be of tar macadam, with a thickness of $4\frac{1}{2}$ inches of metal, and the foundations might be a trifle lighter than those in the more important roads. While a large amount of heavy traffic will not come upon them as upon the roads already referred to, a certain amount of such traffic will do so in the way of loaded furniture vans, and other occasional heavy vehicles, and the road should be capable of carrying such loads.

Width of road 16 feet.
Width of footways 4 feet.
Width of grass margins 3 feet.
Depth of road foundation 9 inches.
Thickness of tar macadam $4\frac{1}{2}$ inches.

It may be argued that a width of 16 feet is insufficient, and it must be admitted that it is very debatable whether the cost of maintenance of such a road is much less than that of a road double this width, for the traffic upon a road is nearly always along the centre half of such a road, and therefore this concentrated traffic would cause the narrower road to require almost as much repair in proportion to the traffic passing over it as a wider road. The author, however, urged that as most subsidiary roads are connected to no important roads, that many of them are only *culs de sac*, and that ordinary vehicular traffic on these roads will consist chiefly of light tradesmen's vehicles, a width of 16 feet is sufficient. The estimated cost of such a road would be £2 8s. 5d. per lineal yard.

Cost of Road Construction.—This is a vital point with the landowner, for it determines to a large extent the class of buildings which he must erect if he is to be recouped for his outlay. The by-laws of our towns and cities are unreasonable in their requirements both as regards width and method of construction of roads. How, for example, can one build workmen's cottages when the roads on which these are to abut must be 40 feet in width, with flagged footways, and a heavy type of kerbing, as is the case in many towns? In the author's opinion it is a waste of money to lay flags and put in, say, 12 inches by 8 inches kerbing in such a road, and an equal waste to make such a road 40 feet wide. He has already suggested in this paper that 30 feet is an

ample width for a street of this class, and the footways should be of asphalt with grass margins, the latter being protected by stone edging, say 10 inches by 4 inches. Not only will this effect a great saving in cost, but roads constructed in this manner will present a more rural and pleasing appearance.

The by-laws requiring roads to be 40 feet wide oblige the man who is intent on building small houses to erect these with narrow frontages and deep backs, a class of house which is objectionable in many respects; a wider frontage with a shallow back being far preferable. The author deprecates the terrace type of cottages, which have been designated "colliers' rows"; this class of house would in many cases not have been erected if it had not been for the cost of roadmaking required by the by-laws, making it necessary for the landowner to crowd as many houses as possible on to his land.

It sometimes happens that a residential area in time becomes one through which heavy traffic passes to an industrial area which has sprung up beyond. Who is to pay for the reconstruction of the through-traffic roads in the residential area should such conditions arise? A proposal has been made, with the principle of which the author entirely agrees, that "in laying out land for residential purposes the developers should be called upon only to lay out and construct such roads as are needful to deal with the traffic of such area; and in the event of existing industrial conditions or future developments causing a need for heavier traffic-bearing roads through these residential areas, the extra cost of such roads, over the cost of roads constructed for domestic traffic, should be borne by the community."

The Widening of Existing Roads.—In designing a town-planning scheme it will probably be necessary to allow for the widening of some of the existing roads. This has been the case at Bridlington, where Cardigan Road, which now averages 36 feet in width, is to be widened to 70 feet. In this instance the east side of the road is built up with large residences, but on the west side no buildings have been erected up to the present. The owner of this vacant land, however, is now desirous of erecting houses on that side of the road, and the Corporation are asking him to give up a 35-foot strip of land for the purpose of increasing the width of the road. Experience has shown that owners of land in various parts of the country have, generally speaking, been quite willing to give up a portion of their land for road-widening purposes, for the reason that if their remaining land abuts upon a wider road it will be of more value to them, and the same argument applies to any houses which the landowner may erect facing the wider road. The Corporation would, of course, construct the road. This matter of the improvement of existing roads is an important one, and must have full consideration when preparing a town-planning scheme.

The Diversion of Existing Public Footpaths.—In preparing a scheme it is often advisable to improve the direction of existing public footpaths, for which purpose full powers are given by the Act, and the engineer should give careful consideration to this point.

Open Spaces.—In planning a residential area it is necessary to determine the best positions for parks, tennis courts, bowling green, children's playground, garden enclosures, sites for future public buildings such as public library, town hall, municipal offices, &c., unless the town is already well provided in that way, and land should be reserved for these purposes. In these matters the engineer will confer with the architect, and, of course, consult the various landowners and others who have interests in the scheme, and it should here be noted that great tact on his part will be required in order to ensure the best results for the Corporation he is serving.

(2) **Sewerage and Sewage Disposal.**—Having dealt with the roads in the proposed area, the next matter for consideration is that of sewerage. The engineer must ascertain (a) if the existing sewers and disposal works are capable of taking the drainage from the proposed area, and if not whether it is proposed to enlarge them, or to construct new sewage disposal works for the area to be laid out; (b) whether the levels permit of the area being drained into existing sewers; (c) how the storm water is to be dealt with.

At Bridlington, if a large area is added to the town as proposed, it will be necessary to take out the existing 12-inch northern outfall sewer which discharges into the sea below L.W.O.S.T. on the North Foreshore, and to put in a 24-inch, or probably 30-inch, outfall in its place; also to enlarge the existing screen chamber, and to put in larger sewers for about a third of a mile, from the outfall sewer to the S.E. corner of the area.

Then, again, on the south side of the town, a portion of the area near Bessingby included in the scheme is too low to be drained into the Corporation sewers, and while some of the front land may drain into the existing sewers if the latter are lowered 5 feet (and no doubt this will be done), the remainder of the sewage will have to be dealt with by the construction of disposal works within the area itself, or be discharged by means of a new outfall into the sea.

The land developer should be expected to pay only for sewers of sufficient size to drain the area, and if he is required by the local authority to put in larger sewers, such as may be required eventually if the area is very considerably extended, the authority should pay the difference in cost.

(3) *Lighting*.—The lighting of the area by means of gas or electric light is a matter of great importance, and the cost of the laying down of mains and cables from the nearest supply will have to be ascertained; if the Corporation own these undertakings, they may have to seek powers to extend their lighting area in order to include the town-planned area.

(4) *Water Supply*.—The same remarks apply to the supply of water in the area.

(B) TOWN PLANNING IN A MANUFACTURING TOWN.

The planning of an industrial town or city is a far more complicated matter than that of a residential town. From an engineering and economic standpoint a number of important matters have to be considered; some of these are as follows:—

1. The first point to be decided is the position of the industrial area. To arrive at this one must have local knowledge—that is to say, information regarding existing trades and manufactures, and which of them is likely to develop considerably. The scheme should also be arranged for the inclusion, if necessary, of any new industries, for it must be borne in mind that the industries of to-day in some of our towns were not thought of a few years ago, and that every month fresh industries are being started, some of them, doubtless, having come to stay. The motor industry might be cited as an example.

2. The proximity of this area, with its works and factories, to railway sidings and to main lines for the supply of the raw material, coal, &c., and for the disposal of the finished materials, is a very important matter. Land adjoining railways, rivers, and canals will, generally speaking, be admirable for inclusion in a manufacturing area. In certain trades, of course, it is important that the works shall be situated where there is much water. Bleach and dye works, for example, are generally found on the banks of a river, stream or canal. These points will have to be considered fully by the engineer when planning the industrial area.

Before deciding on any particular positions for railway sidings, the engineer will naturally consult the railway officials; it is preferable that there should be a general siding leading to a number of smaller sidings. It has been suggested that it will pay a landowner in some instances "to give the land to the railway for the siding or sidings in order that engines might bring the goods nearer to the factories and yet remain upon the railway companies' land."

3. The facilities for vehicular traffic to and from this area. The position of main arterial roads, relative to the proposed area.

While in a residential area it adds to the picturesqueness of the district if the roads are radial in plan (and the author strongly recommended this), in an industrial centre direct communication between the area and the railway, wharf and principal parts of the city is of the utmost importance. The connection of the proposed arterial roads with existing roads is also an important matter.

4. The necessity for constructing any new roads leading to this area in such a substantial manner that they will carry the heavy traffic likely to come upon them. All streets of this class should be paved with stone setts laid on a good concrete foundation, and they should be wide enough to take a double tramway track.

4a. The provision of roads for rapid and slow traffic.

The author recommended the provision of two distinct streets running parallel with each other, but intended one for rapid, the other for slow and heavy traffic. He suggested that such a provision is necessary owing to the increasing number of motor-cars and other speedy vehicles using the roads. In the road suggested the footpaths are flagged, they are 10 feet in width, and the rapid-traffic road is constructed of tar macadam, and is 30 feet wide, while the slow-traffic

road is paved with setts and is 34 feet wide, a 6-foot refuge or footway dividing these two roads. The total width of the street would be 90 feet. It is not suggested that trees should be planted in such a street. Some have recommended that the width of the main arterial streets should not be less than 100 feet or even 120 feet, but the author saw no reason why they should be of this great width.

5. The area to be occupied by workmen's dwellings, and the proximity of this to the industrial area.

There is a difference of opinion regarding the best position for the houses of the workpeople. Some maintain that these houses should be away from the industrial area, but situated in an adjoining housing area, while others consider the houses should be built in the same locality as the works and factories, so that the factory hands will be close to their work, and will not have to walk some distance to their homes. The author favoured the first suggestion, chiefly on the grounds of health. Easy communication can be provided between the two areas, and if they adjoin there need be no reason why the workmen cannot get home to dinner each day. Larger gardens can be better arranged for if the houses are in a separate area, and the fact of the dwellings being away from the works has a tendency to enable the factory hands to forget their daily avocation after working hours.

The author favoured keeping the works and the people apart. If the factories are on one side of a river and the houses of the people on the other, ample provision should be made by means of bridges for easy communication between the two sides.

6. The supply of electrical energy to the manufacturing area for power and lighting purposes:—

This is an absolute necessity in an industrial area. The use of electricity for power purposes is becoming more and more common, and from a smoke nuisance point of view this is necessary, for in many cases the proposed industrial area will be adjacent to a residential area.

If the electricity supply of a town or city is in the hands of the Corporation, the electrical engineer should be asked to advise his committee to obtain, if necessary, powers to extend their area of supply, so as to include this proposed industrial area. Cheap rates for power and lighting purposes should be offered to the factory proprietors to induce them to take the current.

7. Whether water carriage is available, and, if so, the position for wharfage upon rivers or canals must be selected, and the estimated cost ascertained.

8. Provision of water and gas. It is necessary to consider the advisability of supplying water power in an industrial area.

9. Efficient sewerage and sewage disposal system.

10. The disposal of storm water.

11. That the area is sufficiently large to allow of ample provision being made for the future development of the various industries.

12. In deciding the position of the proposed industrial area, the prevailing winds should be taken into account, and the area selected should be so situated that the prevailing winds will carry the smoke away from the residential area.

13. The advisability of constructing subways under the main arterial roads to accommodate gas and water pipes, telephone, telegraph and electric cables, hydraulic mains, compressed air and sewer pipes.

This, in the author's opinion, is a matter which in this country has not received sufficient consideration. The present method of laying sewers, water mains, gas mains, &c., under our streets is altogether unsatisfactory. These streets are continually being opened for the purpose of connecting to one or the other of these, and this constant opening of the principal roads is an intolerable nuisance, while the reinstatement is not always satisfactory and leads to a great deal of correspondence with the departments concerned relative to the unsatisfactory reinstatement of trenches.

The construction of a subway is the remedy, and the author recommended this, but owing to the cost he would build the subway in the main arterial streets only. Reinforced concrete he considered to be an ideal material to use in a structure of this kind.

14. *General*.—In the industrial area might be included refuse destructor works, tramway depôt, car sheds, abattoirs, ice factory, and cold stores; it is always best to group these together, and to place them as far away from the residential area as possible.

15. The construction of tramways or light railways in the area is also a matter of consideration.

16. Folly of limiting the height of buildings. If the maximum height of the buildings which will abut on the new street is specified in a town planning scheme, the owner of the land will be almost sure to build to that height, considering it more economical to do so. If it be four-storey buildings that are allowed, and not higher, then there is a danger of a monotonous row of four-storey buildings being erected, whereas a variation in the height of the buildings will be preferable.

17. Having decided the industrial area, the residential area must then be chosen, and the developments of this will proceed on the lines already indicated in the first part of this paper.

The author pointed out the extent to which town planning affects the engineer. Landowners are, he said, welcoming the adoption of town planning throughout the country, as they find that if their land is left outside the area proposed to be laid out it may be undeveloped for years. Local authorities, on the other hand, have now the opportunity of extending their towns on modern lines, and so making the England of to-morrow a country of beautiful cities with open spaces and wide streets. Many authorities have already taken advantage of these opportunities, and have prepared town planning schemes; many others are now doing so, and it was the opinion of the author that in the near future there will be scarcely a town in this country of any importance that has not its town planning scheme in hand. In order to ensure the best results it is necessary in this matter that the engineer shall co-operate with the architect, and that the one shall appreciate the work of the other. Great tact will also be required in dealing with landowners and other interested parties, and experience has already shown that the landowner is not, except in obscure cases, an unreasonable man to deal with, and that if it can be made clear to him that the development of his land on town planning lines will be a great advantage to him he will be found willing to co-operate with the local authority, and, if necessary, give up to the authority pieces of his land for street widening, provision of open spaces, &c. Many landowners have done this, and have become most keen on town planning.

IRON AND STEEL OF ANCIENT ORIGIN.*

SECTION B.—THE SO-CALLED IRON AND BRONZE AGES.

(Concluded from last week.)

CUNNINGHAM points out that, in true Eastern language and hyperbole, the inscription upon the pillar says that "the pillar is called the arm of fame of Rajah Dhang, and the letters cut upon it are equal to the deep cuts inflicted upon his enemies by his sword writing his immortal fame."

The actual date of its first appearance is probably about 300 A.D.

The committee of the Iron and Steel Institute, in about the third year after its formation, made some special inquiries with regard to this pillar. It appears that Lieutenant Spratt, of the Royal Engineers, then stationed at Delhi, stated the height of the column above the ground to be 24 feet, and the depth below ground 3 feet. He said that the column or pillar ends in a bulb like an onion, which is held in place by eight short thick rods of iron, on which it rests, and which at their lower extremity are let into blocks of stone, in which they are secured by lead. The iron of which the pillar is made seems to have been originally in blooms of about 80 lb. weight each.

There are several important inscriptions upon the pillar. These, notwithstanding the long exposure to wind and rain, are reported to be quite clear and sharp, as if no alteration had taken place since the pillar was first made and erected.

It is stated that these iron pillars were probably used owing to the belief in the special power of this metal to counteract demoniacal influence.

Miss Gordon Cumming, in her book "In the Himalayas and on the Indian Plains" says: "I must first tell you about an extraordinary iron pillar, which stands near the base of the Kootub, and to which the city owes its modern name. . . . It is wrought like our finest metal, and shows no symptoms of rust, though it has stood here for many centuries. It bears an inscription in Sanscrit, describing it as the 'triumphal pillar of Rajah Dhava, A.D. 310, who wrote his immortal fame with his sword.' This, however, is the only record extant of his deeds. There are several other inscriptions on the pillar, but of more modern date."

"The Brahmin tradition is that this pillar was erected

in the sixth century, after the stars had pointed out the auspicious moment. It went so deep that it pierced the head of the serpent god Schesnag, who supports the earth. The priests told the Rajah that thus his kingdom should endure for ever. But, like a child gardening, he could not be satisfied till he dug it up again, just to see if it were so, and sure enough the end was covered with blood. Then the priests told him that his dynasty would soon pass away. He planted the pillar again, but the serpent eluded his touch, and the pillar was thenceforth unsteady. So the priests called the name of the place Dhilli, that is, 'unstable,' and prophesied all manner of evil concerning the Rajah, who shortly afterwards was killed, and his kingdom seized by the Mohammedans, and since then no Hindoo has ever reigned in Delhi.

"Nevertheless, the pillar is now firm as a rock, and has even resisted the cannon of Nadir Shah, who purposely fired against it. The marks of the cannon balls are clear enough. Hindoos believe that so long as this column stands the kingdom has not finally passed from them."

The iron pillar at Dhar or Dhara (the ancient capital of Malava, and thirty-three miles west of Indor), had a total length of no less than 42 feet. This is specially interesting owing to its extraordinary length. The three existing pieces measure 24 feet, 12 feet, and 6 feet in length, aggregating 42 feet, in addition to a missing fragment, so that if these figures are correct the column is approximately double the height of the Delhi pillar.

A writer says: "Whilst we marvel at the skill shown by the ancient artificers in forging the great mass of the Delhi pillar, we must give a still greater measure of admiration to the forgotten craftsmen who dealt so successfully in producing the still more ponderous iron mass of the Dhar pillar monument, with its total length of 42 feet, which, like the pillar at Delhi, is of the Gupta period, or about the year 321 of our Christian era."

There are also in existence in India several very large iron girders at Puri, ornamental iron gates of ancient origin at Somnali, and a wrought-iron gun, said to be 24 feet in length, at Nuwiri.

The author has given a detailed description of these two pillars, as they form the only known ancient large masses of iron in the world, so that they are indeed remarkable. But little more than a generation has elapsed since objects of this size and weight were made possible, even in our time.

SECTION E.—REMARKS BY MESSRS. OSMOND AND MASPERO.

The author has shown elsewhere in this paper that the ancient specimens now examined cannot be termed "steel"—that is, in the true sense of the word. They are practically wrought iron, though, as evidenced in the chisel, there is distinct proof that the edges of this specimen have been submitted to a carburising or cementation process of some kind. In this sense, therefore, the chisel may be termed "steel"—at any rate, as regards such edges.

Moreover, if the art of cementing or steelifying articles of iron was known and understood, then with such knowledge it would be quite possible to produce tools possessing excellent qualities, as the cutting edges could then be hardened by water quenching. If this was so, as appears to be the case, then we can readily understand how the works of stone were executed in Egypt.

Whilst upon this point, reference may be made to some interesting correspondence the author has had with Mr. F. Osmond, the eminent French metallurgist. Some time ago the author asked Mr. Osmond if he knew of any specimens of ancient iron and steel in existence, and also whether he knew of any evidence in France as to the ancient Egyptians using iron and steel tools. He was, however, unable to point to such evidence, but made some inquiries in other directions, with the following result.

These remarks by Mr. Osmond appear to be worthy of giving in full, because they have most important bearing upon the question of the use of iron and steel by the ancient Egyptians. Moreover, they probably prove that the nature of the material used by the Egyptians was iron of similar quality to that found in the ancient Sinhalese specimens obtained from the Colombo Museum, and upon which the present research has been carried out.

Mr. Osmond communicated with the well-known Egyptologist, Mr. Maspéro, in Egypt, that in reference to a note he (Mr. Osmond) had presented to the Academy on bronze work of prehistoric times, Professor Riban, of the Sorbonne, stated he understood that during certain conversation at a personal meeting between Mr. Maspéro, when he was in Paris, and Mr. Berthelot, that he (Mr. Maspéro) had referred to the granite-cutting work of the ancient Egyptians.

* Abstract of a Paper by Sir Robert Hadfield, F.R.S. (Sheffield), entitled "Sinhalese Iron and Steel of Ancient Origin," read before the Iron and Steel Institute at the annual meeting.

Mr. Riban understood that Mr. Maspéro had then said that antique paintings or drawings existed, and that these showed each stone-cutter had assistants at his side, whose business it was to repair or sharpen his tools. From this it appeared that possibly tempered steel was not then in use, and that tools were employed made of iron or bronze.

Mr. Osmond then pointed out to Mr. Maspéro that he had received reproductions of paintings extracted from *Monuments de l'Égypte et de la Nubie d'après les dessins exécutés sur les lieux sous la direction de Champollion le jeune* (Paris, 1845, Firmin Didot), which he thought showed that there were sculptors and stone-cutters who did not appear to have assistants to repair their tools.

Mr. Osmond then asked Mr. Maspéro the following questions:—

"Where are the originals showing the stone-cutters with assistants? If there are any reproductions, where can they be found? Are the paintings or drawings showing the stone-cutters with assistants anterior to those reproduced by Champollion? If this were the case, it might be possible to fix the date of the introduction of tempered steel into Egypt.

"I have been induced to investigate these questions by my friend Sir Robert Hadfield, Fellow of the Royal Society of London, who has recently obtained some interesting ancient specimens and documents relating to iron and steel production in Ceylon."

The following is a translation of Mr. Maspéro's reply in March 1911:—

"I was unable to answer your letter until after my return to Cairo, which occurred only a few days ago. This is briefly what there is to be said on the subject:

"1. Mr. Riban did not gather what I said to Mr. Berthelot quite accurately; I was speaking of experiences of mine about 1884-85 at Luxor. In order to obtain an insight into the technique of the Egyptian sculptors, I ordered from a native copyist of great ability a granite statue in Egyptian style. Being present during the production of this statue, I observed that the workman used for cutting the stone points of soft iron with wooden handles. He had some fifty of these at his disposal, which he placed in the handle as he needed them. Each point became softened after three or four mallet strokes at the most. He then threw this away, took another, and an assistant put the softened points in the fire and then hammered them out to put a new head on them. The statue was made—or, rather, the bust, for it only represented a half figure—in about three weeks, all the work being done practically, as one might say, by wearing out the iron and then restoring its points by forging. By being hammered this point became very hard.

"In the monuments there are no representations where a sculptor is to be found with appliances of this kind. It is the modern usage—and by examining the bronze points and chisels in our museums the idea was suggested to me which I have just called to your attention, and of which I spoke to Mr. Berthelot.

"2. There is nothing either on the monuments or in the museums to indicate that the Egyptians used or even knew of hardened steel."

As an observation on the above, the author would point out that the ancient Sinhalese specimens now described—at any rate, as regards the chisel—show distinct signs of cementation, so that a pointed chisel, by being heated for some time in the smith's hearth, or in some other manner, might become carburised, and, therefore, much harder at the point, even if it was not quenched. It would, therefore, seem from the antiquity of the specimens which were obtained by the author from the Colombo Museum that at any rate at least 1,400 years ago chisels of iron, apparently with carburised or cemented edges, were known and in use. It is, therefore, very probable that the same knowledge existed in Egypt.

SECTION F.—CONCLUSION.

The production of iron of satisfactory quality appears to have taken place on a large scale. The results set forth in this paper, and the various facts referred to regarding the production and use of iron in India, show that in ancient times metallurgical knowledge existed to quite a considerable degree.

This is not unnatural, seeing that Dr. V. Ball, M.A., F.G.S., in his admirable and exhaustive work on the "Geology of India," shows that the deposits of iron ore are very numerous in our Indian Empire. He adds his belief that "there are distinct evidences that Wootz was exported to the West in very early times, possibly 2,000 years ago." Without doubt, therefore, as the natives of India had in bygone ages ample sources of iron ore at their disposal, they knew how to produce iron and steel. It seems highly pro-

bable, therefore, that they did actually export their products to Egypt.

If, too, the photomicrographs of the ancient Sinhalese chisel represent the current practice of that time, as probably was the case, the fact that the art of case-hardening or cementing and carburising wrought iron—afterwards quenched in order to produce articles with hardened cutting edges—was known, is an important piece of evidence, and proves that the art of iron and steel manufacture must at that time have been of quite a high order. In fact, combined with the information submitted regarding the remarkable wrought iron pillars at Delhi and Dhar, the pillar at the latter place being at least 44 feet in length, and of considerable diameter, it would appear that even the production of masses which were not possible in Europe until quite recent times was then undertaken. Beyond Nature's own productions of large meteoric masses, the author believes he is correct in stating that no such large masses were ever known to have been produced in the western portion of our globe at this period. Eastern knowledge was, therefore, much superior to that of Europe.

It is important to know whether the facts stated in this paper warrant the conclusion, as they appear to do, that knowledge existed in ancient times with regard to hardening carburised iron. If they do, we shall then have a satisfactory explanation of how the great works of stone, such as those seen in Egypt, were carried out in past ages—that is, probably by means of iron or steel tools, hardened and tempered to carry a cutting edge.

The author will be more than repaid for any trouble he has taken if this paper throws light upon points which have been before obscure, or if it adds but a small chapter to the knowledge and history of the fascinating metal iron—the metal by the aid of which so much has been done to modify and revolutionise the world, specially in its more recent and modern history.

As regards this revolution, one simple illustration will suffice. In the paper to the Royal Society by Faraday and Stodart on "The Alloys of Steel," in 1822—not very long ago—it is described how the various specimens were carefully prepared in London and sent to Sheffield to be melted and cast under the supervision of an "intelligent and confidential agent." Although this was only eighty-nine years ago, there was then no other way for forwarding such specimens except by road—no "iron" road existed.

It is hoped, therefore, that the research may be a suitable addition to the interesting one regarding Indian steel already set before the Royal Society by one of its Fellows, Dr. Pearson, now more than a hundred years ago.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Education in Architecture.

SIR,—A proposal has been made to my Council by some of the more prominent men in the architectural profession to the effect that the Society of Architects should organise a system of education on similar lines to the ateliers of the Ecole des Beaux-Arts. In addition, it is proposed to institute a method of examination which will tend to eliminate from amongst the students all those who show no real aptitude for the profession, and whose energies could, therefore, be more profitably employed in some other calling.

It is felt that this proposal constitutes a wise development, and one which should prove most popular with all grades of the profession, and my Council are anxious that it should be introduced at the earliest possible moment. They have, therefore, appointed a committee to confer on the subject and to consider ways and means. In addition to three of their own members appointed by my Council, the Right Hon. Lord Saye and Sele, Sir George Riddell, Mr. H. V. Lanchester, F.R.I.B.A., and Mr. A. R. Jemmett, F.R.I.B.A., have consented to serve on the committee referred to, and it is anticipated that other prominent educationalists will also co-operate.

I shall be glad to hear from any other gentlemen, particularly architects, who sympathise with the scheme, and who are willing to assist the Society in putting it into operation at an early date.—I am, Sir, yours faithfully,

C. McARTHUR BUTLER,

Secretary of the Society.

FORTHCOMING EVENTS.

<i>Saturday, October 19.</i>
Institution of Municipal Engineers: Joint Meeting of Yorkshire and Northern Districts at Harrogate, commencing at 8 p.m.
<i>Monday, October 21.</i>
Institute of Sanitary Engineers: Paper on "The Hygiene of Buildings," by Mr. Percy L. Marks, at Caxton Hall, Westminster, at 8 p.m.
<i>Wednesday, October 23.</i>
Manchester Society of Architects: Paper entitled "Growth in Architecture," by Mr. Halsey Ricardo, F.R.I.B.A., at 6.30 p.m.
<i>Thursday, October 24.</i>
Sheffield Society of Architects and Surveyors (Students' Meeting): Paper on "The Use and Misuse of Materials," by Mr. F. Radcliff, at 7.30 p.m.
Architectural Association Camera, Sketch and Debate Club: Paper on "Craftsmanship and Architecture," by Mr. L. M. Phillips, at 8 p.m.
London University: Course of Lectures on "French Renaissance Architecture" by Mr. W. H. Ward, M.A., F.R.I.B.A., at University College, London, at 6 p.m. (3) "The Early Renaissance: The Age of Châteaux." Francis I."

ARCHITECTURAL DRAWING AND DRAUGHTSMEN.*

"ARCHITECTURAL draughtsmanship has fallen from the high place it once occupied, and has been cut off from the main stream of Art." These are the words with which Professor Reginald Blomfield, A.R.A., President of the Royal Institute of British Architects, opens the first chapter of his book on Architectural Drawing and Draughtsmen which has just been published. They sufficiently indicate the point of view from which the President of the Royal Institute looks upon modern architectural drawing, and compares it with the work of French and Italian draughtsmen of the seventeenth and eighteenth centuries.

When we look at the examples illustrated in Mr. Blomfield's book we cannot but realise that there is an immense gulf between the draughtsmanship of these past centuries and that of the twentieth century architectural student. A drawing may set out to accomplish one of two things; to represent an object as it is or as it looks. Architectural drawing usually has the former for its object, and is quite distinct from a drawing of architecture.

In the general sense draughtsmen of the seventeenth and eighteenth centuries, whilst they drew largely in line and hence expressed the actuality of the architectural forms that they delineated, at the same time devoted much care and time to the presentation of shade in their drawings, by which they were able to approximate closely to an expression of the visuality of architecture, and in some of the best and most carefully executed work the line has almost entirely become merged in the shading, by which surfaces rather than edges are represented.

The modern architectural student attempts too often to say what he has to say with the minimum expenditure of labour and thought, and hence practises tricks of draughtsmanship which are but the reflection of devices that have been first introduced into geometrical drawings of elevations to give some suggestion of the appearance of buildings which the geometrical elevation represents only in diagram form. Shadows projected according to the laws of sciography and mass lining are amongst these devices which Mr. Blomfield, impressed and enthused as he is by his study of past masters of drawing, reproaches in forcible terms.

The first chapter of the book before us deals with the Purpose of Architectural Drawing, and this Mr. Blomfield considers to be expressed in three different

directions, for he says: "The intention of the draughtsman may be either to make drawings which can be carried out in the building by other hands exactly as drawn, or, on the other hand, he may wish to produce in somebody else's mind the impression of the building as a whole as he conceives it, or he may employ architectural forms as the symbols and embodiments of some abstract idea, the imagery of a world which never has existed in fact and never can," and he goes on to say that some of the French draughtsmen so used them in the seventeenth century, and in a far more notable manner Piranesi in the eighteenth.

The first purpose of architectural drawing is, as we all know, effected by geometrical drawings, plans, elevations, and sections; the drawings used for this purpose are necessarily diagrams, and Mr. Blomfield tells us that, as we know it, this method is comparatively modern; but it is impossible to conceive, and Mr. Blomfield admits it, that Greek temples and Roman thermæ could have been built without careful and accurate geometrical drawings, which were regarded but as a means to an end; and when that end was served they were either destroyed or allowed to perish. It is possible even for us to suppose that Ictinus was as jealous of the precise lines of the Parthenon as the designers of modern racing yachts are of the precise form of their creations, and that the geometrical drawings of the masterpieces of ancient architecture were deliberately destroyed by their authors. There are even some architects in the twentieth century who will not allow their plans, elevations, and details to be published in the professional journals for the benefit either of their contemporaries or their successors.

The second purpose of architectural drawing as defined by Mr. Blomfield, and also the third, involve the use of perspective, as to which Mr. Blomfield suggests that a draughtsman is justified in modifying the representation of a building that would result from setting up a perspective according to the strict rules of the art; that he may emphasise part of the building in one place, modify it in another, availing himself, in fact, of these principles of selection and restraint which every artist has to employ in the statement of his impression. Mr. Blomfield might have done well in this connection to point out for the benefit of the young student that the perspective of a building, according to the strict rules of the art, is a diagram quite as much as a geometrical elevation, and does not accurately represent a building as we see it or as it looks. The most striking illustration which a student can have of this truth will be offered him by setting up a series of piers in a row, with spherical balls on top according to the strict rules of perspective. He

* *Architectural Drawing and Draughtsmen.* By Reginald Blomfield, A.R.A. With one hundred and three illustrations. (London: Cassell & Co., Ltd. 10s. 6d. net.)

will then understand that neither he nor anybody else would dare to draw these spheres exactly as the rules would enjoin.

The position of architectural draughtsmanship in mediæval times is a matter that is certainly difficult to determine, in spite of the existence of some drawings, principally German, which might have been prepared for the A.A. Sketch Book of to-day.

Mr. Blomfield takes the view that architectural drawing as we now understand it really dates from the earlier days of the Italian Renaissance, and that "it is, by its very nature, essentially a modern art, a complement of methods of architecture and archæology which were undreamt of in the Middle Ages, for it was the revival of scholarship that brought about the study of archæology, and the two together that revolutionised architecture"; but even then he recognises that "the astonishing thing is that architectural draughtsmanship should appear in Italy, completely equipped, within certain limits, in the latter part of the fifteenth century." This would almost seem to indicate that there existed architectural draughtsmanship of no mean quality earlier than the Renaissance period, and that the Italian draughtsmen of the sixteenth century did not evolve their art *ab initio*, but improved upon the work of their mediæval predecessors. Be that as it may, it is in the productions of architectural draughtsmen in the sixteenth, seventeenth and eighteenth centuries that Mr. Blomfield has found a subject which appeals to him personally, and on which he has evidently expended an immense amount of research, the results of which are given to us in this book, wherein he has explained in lucid language the merits of those productions with a keen perception of the forte and foible of each of the draughtsmen whom he has introduced to our notice.

The essence of the lesson that he teaches is that at the bottom of bad draughtsmanship lie imperfect powers of observation. "The eye has not been sufficiently trained to become sensitive to refinements of form and to subtle relations of proportion, a faculty which is essential to fine architectural design." We might add, good draughtsmanship can only come from clear thinking. If he is representing that which exists a draughtsman can only produce a good drawing when he perceives accurately and clearly. If he is endeavouring to express his own invention he must similarly conceive his design with certainty of intention. No such power can be obtained by learning tricks of drawing and conventional methods.

The student who would get the fullest value out of this charming book must realise that the men whose work is reproduced knew what they had to say, and that the matter of their message is of infinitely more importance than the methods by which they expressed it. Mr. Blomfield's scholarship and research will have been worse than wasted if they should be utilised by draughtsmen of the present and the future to discover and adopt more tricks by which to save labour and thought.

NOTES AND COMMENTS.

THE proper lighting of the interior of buildings, especially by artificial light, is a matter of hygienic importance that is gradually becoming recognised by Governments, both abroad and in this country. The French Government has appointed a committee on the hygienic aspects of illumination composed of prominent physiologists, oculists, engineers, physicists, and inspectors of factories. The main objects of this committee are to study, from the standpoint of general health, and its effects upon vision, the various methods of artificial lighting now in use; to determine the composition and quality, from a hygienic standpoint, of the different combustible illuminants, and to examine the effect of prejudicial gases, and the amount of heat developed thereby; to fix a certain minimum amount of artificial illumination favourable to the normal requirements of vision; to study the most practical methods of measuring illumination; to formulate recommendations governing the best means of applying customary methods of lighting to the chief varieties

of industrial operations; to present to the Ministry a report on the subject of short sight and impairments of vision, and on the best methods of guarding against the causes of myopia.

The lead that has thus been given is, we hear through Mr. Leon Gaster, hon. sec. of the Illuminating Engineering Society, likely to be followed by our own Government, and a departmental committee instructed to make a similar inquiry in this country. There can, we fear, be little doubt that the eyesight of children is often seriously injured during the school age by improper lighting, more particularly where artificial light has to be used; but still, to some extent, affected by the improper use of daylight. It must certainly be within the observation of all of us that children are not, during the school age, instructed to be careful in placing themselves so that the light falls properly upon their work.

The account that has been given in the *Chester Chronicle* of the recent discoveries at Chester Cathedral, which have been made in carrying out repairs to the cloisters, owing to the collapse of part of the groining of the east cloister, are of an interesting character. The work now in progress (under Mr. Gilbert Scott), by Messrs. Thompson, of Peterborough, became urgently necessary through a collapse of some of the groining of the east cloister. In restoring the masonry, the workmen found it necessary to examine the outside roof, on which and the adjacent roof of the chapter-house vestibule was a superimposed mass of earth and debris, varying in depth to a maximum of about five feet, with heads and bases of Early English pillars scattered promiscuously among the rubbish and wreckage of demolished buildings. The theory entertained is that the debris represents the ruins of buildings demolished or fallen into decay. It is known that in monastic times the monks' dormitories were over the east cloister. Later they were probably utilised as houses for the lay clerks until they fell into ruins. There have been revealed several architectural features, including the Early English archway of a former building incongruously in situ in the cloister roof, a quatrefoil window (one of three) at the head of a flight of steps, and a doorway communicating with a staircase through which the monks would go from their dormitories to say their night offices in the church. There have also been discovered (on the cloister side) three bricked-up small arched windows in the south wall of the refectory just above the beautiful "reader's pulpit." These windows probably will be restored, and the Dean (Canon Gore) and the Precentor are keenly in favour of restoring the refectory as a whole. The cost would be about £10,000.

We regret to hear of the death, in his eightieth year, of Mr. James Parker, who has rendered valuable assistance to several generations of students of English mediæval architecture, by his well-known text-books, "The A.B.C. of Gothic Architecture" and "The Introduction to Gothic Architecture." Born in 1833, he was the son of Mr. John Henry Parker, C.B., also a famous antiquary, and member of a family which claimed descent from Samuel Parker, Bishop of Oxford in the reign of James II. Mr. Parker was educated at Winchester, and received the honorary degree of M.A. at the Oxford Commemoration in 1877. Mr. Parker was the mainstay of the Oxford Architectural and Historical Society, and held various positions in connection with it. The proceedings of the society are full of papers by him, and for a number of years he conducted excursions of the members. He possessed a mine of knowledge of the early history of the society, which is really the history of the Gothic revival. One of Mr. Parker's best-known works is the "Early History of Oxford," published in 1884—the first book on the history of the University city, in which the writer has gone to the original manuscript authorities. He collated all the different manuscript versions of the "Anglo-Saxon Chronicle."

The mercantile world of Liverpool has experienced a grievous disappointment in the abandonment of the projected scheme for the erection of a new Custom House on the old George's Dock site at the Pier Head. The whole of the central site, comprising a building area of 6,700 square yards, has been purchased by the Cunard Co. from Messrs. Cubitt & Co., of London. It appears that there has been a certain amount of muddle and misunderstanding in the negotiations which have been going on between the Corporation, the Government, and Messrs. Cubitt & Co. The result is that the Corporation will get their full price for the central George's Dock site, and a very fine building will be placed upon it by the Cunard Co.

An interesting announcement appears in the *Times* of the discovery in Wales of the most ancient painting in Great Britain, which is the first example in this country of prehistoric cave painting of the kind already familiar to palæontologists from the caves of Dordogne, the South of France, and the Pyrenees and the Peninsula of Spain, and has been recently discovered on the walls of Bacon's Hole, near the Mumbles, by Professor Breuil and Professor Sollas.

We are asked to call attention to a course of six educational lectures on concrete, its properties and manufacture, which will be given by Mr. H. Kempton-Dyson, Secretary of the Concrete Institute, on Tuesdays, November 12, 19, 26, December 3, 10, 17. These lectures will be given in the lecture hall of the Concrete Institute at Denison House, 269 Vauxhall Bridge Road, Westminster, and are free to all who obtain a ticket by application to the Secretary of the Institute.

Mr. Frank Latham, in his presidential address at the Institution of Mechanical Engineers, spoke of the architectural character of the work, which is part of the duty of the so-called municipal engineer, in the following terms: "The civil engineer of to-day, however, does not profess to be an architect, but the municipal engineer cannot afford to neglect this very important and artistic side of his profession. A substantial knowledge of architecture is essential to his success, as buildings of various descriptions have to be designed and constructed under his supervision. He is called upon to advise his council on the laying out of estates and the examination of building plans, while he has the planning of many schemes which must necessarily call for artistic treatment at his hands. A municipal engineer engaged at any seaside resort would be quite unsuited to hold his position without a knowledge of architecture, by which he could design and carry out the works expected of him. The interests of the municipal engineer require watching in this respect, for their profession is so intimately associated with architecture, as well as with civil engineering, that no legal rights of status or protection should be granted to either one profession or the other without the rights of the municipal engineer being recognised on both sides. The present-day engineer's attention is so much engrossed by the scientific and mechanical sides of his profession that the very sentiment of the artistic is abandoned and neglected, and its place among the liberal arts is long since forfeited. The municipal engineer, however, must not be persuaded that he is essentially a civil engineer; his training must be broad and varied, and while a knowledge of the mechanical sciences is necessary, he must cultivate the artistic side. Architects to-day are mastering so many matters of extreme importance to municipal engineers, especially since the advent of reinforced concrete construction, that the municipal officer may be more fitted in many respects if drawn from the architectural profession than from that of pure civil engineering. To be a competent engineer to a municipality a man must be cultivated in every direction—civil and mechanical engineering and architecture."

In the *Antiquary* for this month there is an interesting article on the Sanctuary and Basilica of St. Martin at Tours by Mr. J. Tavenor Perry, with a plan reduced from the survey made for the commission in 1864, showing the general arrangements of the building as it formerly existed and the parts that now remain of the Abbey Church of St. Martin. In this Mr. Perry gives a new and ingenious derivation of the meaning of the word chapel, which *si non è vero, è ben trovato*.

THRONDHJEM CATHEDRAL.
By J. TAVENOR PERRY.

THE three metropolitan churches at Lund, Upsala, and Throndhjem are the most important ecclesiastical edifices in Scandinavia, but they all bear distinctly the impress of foreign influence in their arrangement and design. Although the Vikings, particularly during the pre-Christian period of their history, were able to produce the most beautiful works in bronze, wood, and ivory, the more important art of architecture never found a natural home among them; and their warlike habits continually engaging them in foreign or internecine quarrels, compelled them to rely on the architects of other races for the production of their public buildings throughout the mediæval period, and, indeed, until the time when De Tessin erected the huge Stockholm Palace for Charles XII. Hence it is that these three cathedrals are, respectively, so distinctly German, French, and English in their character, and lend such an appearance of probability to the traditions which attribute the design of Upsala to

INTERIOR OF EAST END.

Etienne de Bonneuil, of Paris, and that of Throndhjem to Prior Thurgot, of Durham.
The semi-mythical period of Norwegian history, during which the people oscillated between heathendom and Christianity, ended when Olaf the Saint became king; and although there is much that is perhaps legendary in the stories we have of his life, the main incidents in it are clear and well authenticated. His godfather, Olaf Tryggvason,

the introducer of Christianity, had already founded the town of Nidaros—Nidmouth, as we should call it—at the mouth of the river Nid, south of the great fjord, as the chief city of the Thronanders; hence its modern name of Throndhjem. The site was a sandy peninsula sloping gradually towards the sea, and rising to the south, where the river made a half-circle round it, into a little hill. On this higher ground Olaf erected his hall, and in connection with it a wooden chapel dedicated to St. Clement. After the ruin and death of Olaf Tryggvason this hall and chapel seem to have been destroyed, but about 1016 Olaf the Saint rebuilt St. Clement's in stone, and was himself buried in the ground to the south of it, a little nearer to the river; and in 1031 his body was raised and enclosed in a wooden casket and placed within the chapel. This may have only been intended as a temporary arrangement, as Magnus, the son of the saint, erected over the site of his father's grave a small wooden chapel which occupied the exact position of the termination of the present choir; and then, or soon after, the shrine of St. Olaf was removed into it. To the west of this chapel Harald Haadraade, the son of Magnus, built another small stone church, thus forming a group of three buildings quite distinct from each other.

After the death of Harald at the battle of Stamford Bridge, Norway had a peaceful time under his son Olaf the Quiet, during which this group of buildings may have undergone great changes, as we are told that the king, with the assistance of Thurgot the Prior of Durham, built the cathedral. Unfortunately no building work answering to this period now remains, and the story, at least so far as it relates to Thurgot, is open to considerable doubt. Thurgot was certainly in Norway as an exile during the time of Olaf, and seems to have been engaged in some unecclesiastical work, for he is said to have amassed some wealth which he lost by shipwreck when returning home, and so took to a religious life. Becoming a monk he was placed by Bishop Walcher with Aldwin at Jarrow in 1074, and he does not appear to have had the opportunity of revisiting Norway during the remainder of his busy career. From 1087 to 1109 he was Prior of Durham under Bishops William of St. Carilef and Ralph Flambard, a period of most important building operations in Durham Cathedral, and later he became Bishop of St. Andrews.

In 1140 Nicholas Breakspeare, then Cardinal of Albano, was sent on a mission into Scandinavia, with the result that Throndhjem was made the seat of the Primate of Norway, and Harald's small stone church became the cathedral. Eysteen, or Augustine, was consecrated as the first Archbishop; and there is some probability that he, like Henry, whom the Cardinal consecrated Bishop of Upsala, was an Englishman, as, when driven by political troubles from Norway in 1180 he sought refuge in England, and in the extensive works he executed at Throndhjem he was undoubtedly inspired by English models. Eysteen commenced the enlargement of his church by building to the west of it a tower and short aisleless transepts, each having on its eastern face a large square chapel, and the view we give of one of these will show very clearly the character of the work and its similarity in detail to much of the architecture of Durham. The date when these works were in progress synchronises with a pause in those of Durham, between the completion of the chapter-house and the commencement of the Galilee, and when the first church of Hartlepool, of which the south door is the sole relic, had just been completed; and it is not improbable that some of the unemployed masons found their way from that port to Throndhjem. This is confirmed by the appearance among the capitals of the transepts, as well as in the chapel of St. Clement which Eysteen is said to have rebuilt, of the transitional volute which forms a feature in all Pudsey's buildings, as well as at Darlington and the second church of Hartlepool, which was begun before the close of the twelfth century.

After Eysteen's flight to England in 1180 there was a pause in the work at Throndhjem for fifty years; and when in 1231 Archbishop Sigurd recommenced building it is not quite clear on what part he began. It is evident that the tomb-house was rebuilt about this time, but whether as an isolated building, as was suggested by the late Mr. Street, cannot now be determined, although the position of its elaborate doorway on the south-eastern face would seem to confirm this theory. It could not, however, have remained for long isolated, for whether or not Sigurd had ever made a pilgrimage to Canterbury, he had doubtless become aware of its peculiar arrangements, and he may have conceived the idea of so far imitating them as to join his choir on to the

tomb-house and make that play the part of Becket's Crown. Whether the old choir, Harald's original stone church, was entirely removed is doubtful, and the idea mooted in the *Ecclesiologist* is perhaps correct that the choir, which was a close one like Rochester, consisted of the old building enclosed within new aisles and extended eastwards to join the tomb-house. The arcades of the new choir were, however, not parallel, but opened out considerably towards the east so as to give as wide an opening as possible to the tomb-house, and the narrow aisles followed the same slanting lines. That the aisles were an addition to the width of the old choir is shown by the pointed arches which have been cut through the eastern walls of Eysteen's transepts and the alteration of the triforium arcades.

In 1248 the westward extension of the church was commenced, but how far it progressed we cannot be sure, though it seems certain that what promised to be a most beautiful example of the Early English style of architecture was never completed. As designed it would have consisted of a central nave with two aisles measuring about 132 by 70 feet internally, and a west front extended beyond the aisles by lateral chapels, the whole measuring 125 feet across. It was intended to be vaulted, the aisles being lighted by pairs of simple lancets with a small pierced circle over them in one group, but without any enclosing label. As the whole of the interior of the nave has been destroyed we can only judge of the manner in which it was intended to be finished by the lateral chapels behind the west front screen, which fortu-

LATERAL CHAPEL OF NAVE.

nately remain perfect; and these present such remarkable deviations in their enrichments and carving from ordinary Early English work as to show that carvers, other than English, were employed upon the building. Bead-and-reel enrichments are intermingled with dog-tooth, whilst some of the capitals of the trefoil wall arcading might pass for south French Romanesque.

The west front of Throndhjem was its great glory; and our illustration showing it in a state of unrestored ruin will give some idea of what it was, or at least of what it was intended to be. There is an engraving by Mascius, dated 1661, showing another gallery of niches above the present, and from this and from contemporary accounts we find that a central trefoiled niche above the main entrance contained a sculptured representation of the Crucifixion, with the Blessed Virgin and St. John, and in the niches on each side were the Twelve Apostles and Martyrs. Mascius's engraving shows all the niches as, in his time, occupied, but as he

CHAPEL IN TRANSEPTS.

also shows eight niches only instead of nine on each side of the centre, and misplaces even those statues which still remain, his scheme of iconography cannot be relied upon. The five statues which are still left are too dilapidated for identification, with the exception of one which seems to be intended for St. Denis. In 1661 the lower portion of the great west window still existed, with a series of figures in niches having pediment heads on each side for the width of the west front to the upper part of the nave. Whence the design for this beautiful front was derived it is impossible to say; but in the smallness of its doorways and other details it is essentially English, although no particular example can be pointed out from which it could have been copied. The character of the sculpture and the general arrangement of the plan recall Wells, with which it was almost contemporary, while in many details it suggests some affinity to the Nine Altars at Durham; and it is not improbable that one of Prior Melsanby's masons, who was not unacquainted with Salisbury, may have been entrusted with

the work. The bold moulded and weathered plinth of the front may be compared with those of Hartlepool and Tynemouth, and forms an additional proof of the English origin of the design.

In 1328 the cathedral was severely damaged by fire, and it is uncertain if anything was done afterwards to restore the west end of the church, for in 1531 it was again burnt out and left unrestored; while the fall of the central tower in 1689 completed the ruin of that part of the fabric. It would seem, however, that the tomb-house was thoroughly restored and in part rebuilt, undergoing at the same time some important modifications. In this reconstruction a large part of the western half of the octagon was destroyed and rebuilt on different lines so as to make it more accessible to the choir; and to this may be due the singular irregularity of this part of the building. But in this restoration, even where it amounted to rebuilding, the main features of the original design were strictly adhered to, so that, looking at it generally both inside and out, it might very well pass for

the work entirely of one period. But there are certain details, such as the tracery of the triforium arcade and in the screen at the east end of the choir, of a later date and so distinctly Kentish in character as to make it highly probable that the restorer was well acquainted with Prior de Estria's work at Canterbury.

The conventual buildings stood on the south side of the church, between it and the river, but they have been entirely destroyed, leaving, however, slight traces of the cloister and marks of a slype or chapter-house against the walls of the south transept. The little chapel of St. Clement, which occupies the site of the earliest building of the group, fortunately still remains perfect. Its rebuilding was attributed to Archbishop Eysteen, though it may belong to a slightly subsequent date, and it presents a curious admixture of German and English detail. Externally it has the appearance of a small Norman apsidal chapel of the simplest form, but its plan, as will be seen from our sketch, is somewhat complicated. The square portion is vaulted in two bays of quadripartite vaulting, with a large roll on the diagonals, and across the chord of the apse is a screen, vaulted in three bays, showing towards the nave a great trefoil arch of a very German character. The side bays of this screen contained altars, but the centre was open as a passage to the altar in the apse. From the southern bay of this screen a way has been formed giving access to the tomb-house, made

certain extent the architectural aspect of town planning must of necessity take precedence over the engineering standpoint, and within certain limits the engineer will step in when the architect has completed the rough outline of his plan, just as in the architect's design for a great building the engineer can be usefully invited to confer on details which of necessity he must be more familiar with than the architect. The contour of the ground must to a large extent govern its laying out, and such questions as main drainage must of course be left to the engineer. Mr. Mathews suggested three classes of roads. In Blackpool there have been for many years six standard forms of roads, so that each type of roadway may be adapted to the economical conditions for the development of the land, which are after all paramount in any well-devised scheme of town planning. It is, perhaps, better to have wide spaces between building lines than grass margins as part of the roadway, except in special cases where they can be well looked after, as such margins tend to become untidy and depressing. The benefits of ultimate wide arterial roads can quite easily be secured for future use by authorities acquiring land for highways of an ultimate width of 60 to 100 feet, and allowing owners in the meantime to enclose in their front gardens or lawns so much of the width as is not necessary for immediate road purposes. It will be found that in many cases a 36 ft. roadway—of 21 ft. carriage-way

THRONDHEIM CATHEDRAL.—REDUCED FROM PUBLISHED PLAN BY H. E. SCHIMER.

probably when this was restored after the fire; but originally there does not appear to have been any connection between the buildings.

The walling throughout was in a coarse talcose schist, intermingled with quartz brought from quarries near by, which must have given it a somewhat sombre aspect; but when complete, if indeed the western parts were ever completed, the appearance of this group of ecclesiastical buildings, clustering on the hill above the town, must have presented a striking appearance on entering the river from the fjord, worthy of its rank as the metropolitan church of Norway and the crowning place of its kings.

THE SOCIETY OF ENGINEERS.

A MEETING of the Society of Engineers was held at the Institution of Electrical Engineers, Victoria Embankment, W.C., on the 7th inst., when Mr. E. R. Mathews, A.M.Inst.C.E., F.G.S., read a paper on

Town Planning from an Engineering Aspect.

A lengthy report of the paper was given in our issue of last week.

Mr. John Kennedy, the chairman, having formally moved a vote of thanks, three communications were read.

Mr. John S. Brodie, M.Inst.C.E., borough engineer of Blackpool, in a written communication, said that to a

and two 7 ft. 6 in. footpaths—will be ample for present purposes; and the land for future widening being secured, the expenditure on such future widening can be deferred until the volume of traffic warrants it, and should then be borne by the community and not by the abutting owners. It is open to discussion whether the German method of purchasing the freehold of land immediately adjacent to the town area—a method adopted at Blackpool with much success for some years past—is preferable, so that the municipality reaps the advantage of the increased land values rather than the individual land owners.

Mr. J. W. Cockrill, M.I.C.E., A.R.I.B.A., borough surveyor, Great Yarmouth, in a letter, remarked that town planners will complain that Mr. Mathews insisted on too high a standard for roadmaking. The estimates given are low for the work proposed, and could not be executed for the money in all parts of the country. It had been recently pointed out that "the Housing and Town Planning Act gives remarkable facilities for the making of bargains between local authorities and land owners, and the extent to which the Act is used will largely depend upon the extent to which those interested in the land meet those interested in civic progress in friendly co-operation for mutual benefit." The by-laws in most towns frequently come in for a large share of hostile criticism by town-planners and a section of the public, especially in their result on the planning of corner houses and in the question of drainage. As to the first,

the experience of what has been done by architects and builders in overcrowding sites where there has been no by-law controlling this matter gives no encouragement to the relaxation of this by-law; and in the second item, until the law is altered which provides that each house must have its separate drainage local authorities will not be prepared to accept the responsibilities involved in giving way on this point.

Mr. Ebenezer Howard, in opening the discussion, said that Mr. Mathews had divided his paper into two sections as though those two included all possible cases. But there was a third type of town planning which is very little thought about at the present day, but which will be later largely thought of, and that was a town planning scheme in an agricultural area. It was well to remember that the town planning at Letchworth embraces an area seven times as large as the old walled-in city of London, being 4,500 acres in extent. There they had an instance of what he might call town planning *ab initio*. In fact, he contended that town planning in its real and in its primary meaning consisted of the building of new towns, and not the building of additions to existing towns. In this country where there were so many large towns growing and developing, the question as to the way they are to grow must be a very important one. The author had talked about the making of such provisions in regard to roads as will enable them to be widened if necessary afterwards at comparatively little expense. At Letchworth they had had to deal mainly with two types of roads: (1) those existing on the estate, and (2) those that had to be specially constructed. One of the first-mentioned kind was very narrow in places, and their architect advised that leaseholders along it should be allowed to use certain land abutting on the broadened road line on the understanding that if the land was required for the widening of the roads they would surrender it. In his own opinion grass margins were more suitably placed when the road is not a wide one between the side-walk and the houses, and that it was still better to allow the tenants of the houses to utilise what would be otherwise grass margins on the understanding that they will give up this land when required. At Letchworth they dealt with their area from the point of view that where there was then a purely agricultural district there would grow up a considerable town with many industries. So they considered where they would allow them to come; they naturally selected a site near a railway, and there there has since grown up many important industries of wide variety. They also had to decide whether the housing of the people should be adjacent to the works or not; eventually they decided to set aside land for this purpose near the proposed works. At Letchworth they had now nearly eight thousand people. A workman can there go back to his house for his meals, and opportunities for recreation during his free time are close at hand. It was to be hoped that engineers would recognise that in this country there were vast acres left as wildernesses, and that there were latent possibilities lying dormant in these unoccupied and unused acres for the development of healthy, beautiful, and useful towns which will rival in a perfectly natural and healthy way the old towns, so that the rivalry will produce beneficial effects on both. Any town council or landlord which proceeds upon the old lines of overcrowding their land area (though by so doing they might make immediate profit) are allowing cottages to be put up which will be soon out of date and which no respectable workman will occupy.

Mr. Holroyd Smith said he must compliment the projectors at Letchworth for the great work they had done. Everyone, of course, knew that in these matters it was easy to deal with a clean sheet. His own experience of American cities was that, while the gridiron plan enables people easily to find their way about, it necessitated a huge walk to get from one corner to another. He would suggest that the basis of a new town plan should be not squares but hexagons. The latter would allow of opportunities for fine architectural effects which cannot be obtained when the basis is a square. He had long been contending that the usual section of a road was a wrong one, and that it should be made not on a curve as at present, but sloping from each kerb towards the centre. The numerous motor-car accidents were nearly all caused by the vehicle slipping down the camber of the road towards the pavement. Another contention of his was that the accepted method was wrong of dealing with traffic at busy spots like Ludgate Circus and Oxford Circus, where four roads meet. A Frenchman had advocated that instead of holding up the east and west vehicles while the north and south streams cross and vice versa, all the vehicles should be made to go round in a circular direction until they came to the road down which they wanted to proceed.

Mr. C. T. A. Hansser stated that his experience in St. Petersburg was dead against streets draining to the centre in the manner the previous speaker proposed. The bulk of the rain-water flowing into a street came from the adjoining houses and courtyards, and gets away by means of the gullies at the kerb. But if that water has to reach the middle of the street before it can escape it is impossible to keep the streets clean. In St. Petersburg, in spite of an army of men there was always much mud and accumulations of water. He believed that the correct principle was to have the gullies at the kerbs where the water can be got rid of as quickly as possible. In planning new cities it was important to avoid the centralising of people in the factory districts. He hoped the day would come when each family would do its work not in a large factory but at home, and when transport from one cottage to another would be as easy as from one part of the factory to another.

Mr. Davidge, A.M.Inst.C.E., said that they must bear in mind that with such a subject as that under discussion it was necessary to secure the co-operation of a large number of professions. The architects seemed to have been doing most of the talking about town planning, but engineers had had a very long innings previously. He was afraid that the architect will only come in as an afterthought. One looked to the engineer to bring the architects down to earth again after their flights of fancy.

After some further discussion the vote of thanks was put by the President and carried with acclamation.

Mr. Mathews, in replying to the discussion, said that many local authorities were not doing now as much as they ought to do in this matter from fear of involving the town in some expenditure. In Bridlington the council had during the past fourteen years spent over £50,000 in street-widening—all, or most of which, might have been saved by forethought in the past. Letchworth had been laid out on modern lines and was a credit not only to this country but to Europe. He was pleased to hear that the Ruislip-Northwood Council were going to try and obtain some control over the elevations of proposed buildings.

THE SOCIETY OF ARCHITECTS.

THE annual report of the Council of the above Society for the year 1911-12 covers all the points of interest to the members. Among the various matters dealt with are the following:—

Registration of Architects.—Early in the session the Council of the Royal Institute of British Architects, after further consultation with the representatives of the Society, drafted a new supplemental charter and by-laws to enable the arrangements previously provisionally agreed upon to be carried into effect, and in January last a special general meeting of the Royal Institute was held to consider the question of applying for a new supplemental charter and by-laws to authorise the Council of the Royal Institute to enter into a conditional agreement with the Council of the Society of Architects. A copy of these documents and the explanatory statement of policy drawn up by the Royal Institute and submitted to their members was at the same time sent to the members of the Society for their information. At this meeting the whole matter was referred back to the Council of the Royal Institute, who thereupon appointed a committee to consider and report upon the subject. It is understood that this committee has held a number of meetings, and that from time to time it has been reconstituted or strengthened, but up to the present the result of its deliberations have not been made known to your Council. The Council of the Society of Architects had, as stated in their last report, already decided that the routine work of the Society should continue without reference to the negotiations proceeding between the two Councils, and they have now decided to also take up the registration question and to resume activities at the point at which they were temporarily suspended two years ago pending the negotiations referred to. Steps are therefore being taken to reintroduce the Society's Registration Bill during the next Session of Parliament.

General Purposes Committee.—This Committee have met five times, and has been principally engaged in carrying out an instruction from the Council to embody in the articles of association the scheme adopted by the Council for reorganising the Students' Section and examinations, &c., and in considering and reporting upon the desirability or otherwise of amplifying or revising the articles in other directions in order to better meet the present requirements of the Society and to provide for future developments.

Professional Defence.—The question of forming a Board of Professional Defence for the purpose of advising and if necessary assisting members in cases involving matters of general professional interest to the profession on points of practice has been carefully considered, with the result that an Advisory Committee has been formed consisting of the President, the Vice-Presidents, the Hon. Secretary and Secretary of the Society, together with Sir George Riddell and Mr. E. J. Naldrett, Barrister-at-Law (Hon. Members), and Mr. A. Montefiore Brice, Barrister-at-Law, and the Hon. Solicitor, Mr. T. Baines. An adequate sum has been earmarked to form the nucleus of a defence fund, for use when necessary in forwarding the objects of professional defence. This is a very important extension of the work of the Society, and one which it is anticipated will be of great practical value to the members. Cases submitted to the Secretary will be brought before the Board, who will advise the Council on the merits, and if the interests involved are of such importance to the profession generally as to warrant any action being taken by the Society as a corporate body, the Board will further advise the Council as to what course to follow. The scope of the Board will be confined to dealing with matters involving questions of principle affecting the general body of members, and therefore of the profession as a whole. The Council draw attention to the decision of Mr. Justice Channell in *Crittall Manufacturing Co. v. L.C.C.*, which was an action by a sub-contractor to recover against his clients failing payment by the builder. It would seem desirable that in future architects should obtain a written undertaking from the sub-contractor that he will not look to the client or the architect for payment.

Membership.—The present total membership is 1,214, being made up of 31 hon. members, 16 retired members, 931 members, and 236 students. A proposal for the development of the membership referred to in the Council's last report has now materialised by the adoption of a scheme for grading the membership on the following lines, having in view the time when examination will be the only test of qualification for admittance to the Society, viz., students, graduates, and members.

Professional Ethics.—The matter of the proposed code of professional ethics has since been before the Council, and suggestions for a set of regulations have been drawn up by them and distributed to the members for their consideration. There appears to be considerable difference of opinion on the matter, both as to the necessity or desirability in principle of endeavouring to codify regulations of this kind, and as to what form a code, if drafted, should take. The Council, after prolonged consideration, have decided to embody and publish in due course the results of the many valuable expressions of opinion and suggestions made by members, in the form of a schedule of guidance on the main points governing professional etiquette in the practice of architecture, and in the meantime to take powers under the articles of association to deal with any alleged breach of professional etiquette affecting members which may be brought to their notice. By so doing the Council will be free to adjudicate upon any case on its merits, and able to administer whatever penalty (if any) the offence may in their opinion call for, without being subject to the limitations which a written code might be held to exercise upon them when acting in a judicial capacity.

Architectural Education.—The Council have had under consideration a proposal for introducing into England a system of education on similar lines to the ateliers of the Ecole des Beaux-Arts, in Paris. The Council being of opinion that it is desirable to extend this system in England have appointed a committee to confer with educationalists on the subject and report in due course.

FIRE TESTS OF THE BRITISH FIRE PREVENTION COMMITTEE.

The British Fire Prevention Committee on Wednesday conducted a further series of fire tests in respect of roofing materials, the coverings under investigation being corrugated sheets of asbestos-cement made in Canada, and produced in such a manner that they can be applied in the same way as the well-known corrugated iron sheets, whilst having great advantages as to non-conductivity against heat and fire.

It will be realised that these tests were of particular importance to our Indian and Colonial authorities, as the difficulty of finding suitable materials to meet the climatic conditions has always been great.

Mr. Edwin O. Sachs, F.R.S.Ed. (Chairman of the Executive), Major O'Meara, C.M.G. (General Post Office),

Mr. Horace S. Folker, F.A.I. (Hon. Treasurer), Mr. Percy Collins, F.S.S., and other members of Council received the members and visitors attending at the committee's Regent Park Testing Station, and the operations were conducted by a strong sub-committee under the direction of Mr. C. T. Cuss and Mr. Ellis Marsland (District Surveyor).

The roofing material under test was tested at different angles, fire being supplied in different forms, such as bonfires, fire brands, &c., and certain of the roofs were also subjected to water from a steam fire engine when they were in a heated condition.

The visitors, as usual, comprised representatives of the principal Government Departments concerned, including the War Office, H.M. Office of Works, Home Office, Admiralty, &c., but on this occasion also the representatives of the various Colonial Government Agencies, &c., were present, and there was also a considerable attendance of insurance surveyors, engineers of railway companies, and fire brigade officers.

As to the results of the tests, these will be issued in about six weeks in the usual illustrated report, and will be known as Red Book No. 168.

COMPETITION NEWS.

PLYMOUTH.—The Education Committee at their last meeting agreed that plans for the proposed rebuilding of the Public School at an estimated cost of £13,370 should be obtained through a competition limited to architects practising in the town. The President of the R.I.B.A. will be invited to nominate an assessor.

ILLUSTRATIONS.

COMPETITION DESIGN FOR NEW HEAD OFFICES, PORT OF LONDON AUTHORITY.

This design was submitted in the first stage of the competition by Messrs. Macintosh, Cole & Newman.

A CHURCH INSTITUTE IN JERSEY.

This building (proposed to be erected at St. Brelade's, Jersey) is to be built from the designs of Messrs. Rogers, Bone & Coles, with Jersey granite, which has so many charming varieties in colour and texture. The site is a difficult one, being on a somewhat steep slope, and the road from which it will be entered is on a higher level. The accommodation is to consist of hall, committee room, gymnasium, dressing-room, &c. The hall and committee room are to be suitable for use for Sunday School purposes.

HOUSE AT BUDLEIGH SALTERTON.

The drawing shows an attempt to give some interest to the treatment of an internal angle of a house of simple design, erected at Budleigh Salterton for Commander Brant, R.N. The short columns, cill, and lintels are of Douling stone. The builder is Mr. J. C. Palmer, of Budleigh Salterton, and the architects Messrs. Rogers, Bone & Coles.

SEDILIA IN CHURCH OF ST. MARY THE VIRGIN, STAINDROP.

The church of St. Mary the Virgin, Staindrop, is in many ways one of the most interesting ecclesiastical edifices in the county Durham. It consists now of chancel, with vestry on the north side and *domus inclusa*, nave with north and south aisles, and north transept, south porch, and engaged western tower. The sedilia are the only feature distinctly characteristic of the period of the alterations in the fourteenth century. They are three in number. The head of each is a richly-moulded trefoil arch. The arches rest at the extremities of the range on filleted nook shafts, and midway on carved corbels. Over both shafts and corbels are capitals, all of which, except one nearest the west, which is moulded, are richly carved with fully developed Early English foliage. The corbel nearest the west consists of foliage, whilst that to the east is a priest's head, possibly that of a cleric who was rector of Staindrop when the work was executed. These, which are by far the finest sedilia remaining in the county, recall very forcibly the wall arcading of the Nine Altars Chapel in Durham Cathedral, and indeed may safely be attributed to one who, if he had not actually been engaged upon, was, at least, intimately familiar with that work. The drawing by "Alpha," which we reproduce, was awarded a prize in the monthly competitions of *The Architect Students' Sketching and Measuring Club*.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE regret that we have not received a larger number of contributions for last month's subject. There is much to be learnt from the study of old cottages and farmhouses. Although it may be true that many of these are void of architectural merit and are merely shelters, yet it is beyond question that there are plenty still remaining in all parts of our own country, and also on the Continent, which present valuable object lessons. We may learn from these that detail and ornament are not an essential in architectural design; that beautiful buildings may be erected without adopting the grand manner.

Simplicity of treatment, picturesqueness of grouping, and the unaffected use of material are characteristics of good cottage and farmhouse architecture, and are valuable qualities for an architect to develop. Care must, of course, be taken, when we are attracted by a pretty cottage, to distinguish between the adventitious elements of age and environment, which often make up no inconsiderable part of the attractiveness, and those more solid and artistic qualities which are part of architecture.

"Alpha" has sketched a red brick cottage at Pathhead, near Stella, county Durham. The house is roofed partly with pantiles, partly with stone slates, and is picturesquely grouped. The drawing is well composed, but the values are not happily expressed, and there is a tendency to depend on the modern fashionable refuge of the destitute, the thick line, for expression of masses. There are no lines in nature but only surfaces of varied tone, and the thick mass line in perspective drawing is a mere trick devoid of all logical or reasonable excuse.

Mr. Charles S. Carter sends a sketch of a charmingly picturesque cottage at Pulborough, Sussex, which, in its grouping and combination of brick, half-timber and plaster, and hung tiling with tile roof, the whole set up on a rough stone retaining wall, is an admirable piece of simple and effective architectural design. The drawing is a brilliant piece of pen and ink work.

"Avec beaucoup de Peur" has given us a boldly drawn sketch of a cottage at Brimscombe, Surrey, which is a capital example of grouping and an illustration of our remark that detail is not an essential in architectural design. The thick mass line shows a tendency to creep in, but the general calibre of the drawing prevents it from being too obtrusive.

Mr. Charles H. Roberts has found a fifteenth century half-timber cottage at Wimborne, which, with a gable towards the street, is a good piece of design as well as an antique, and is expressively drawn without affectation.

Although the drawings sent do not all excel in the same direction, we consider that on a just balance of merits and defects they are practically equal, and we have decided to award a prize of half a guinea to each.

THE ARCHITECTURAL ASSOCIATION.

THE annual general meeting of the Architectural Association was held at their premises at 18 Tufton Street, Westminster, W., on Monday, October 14. The chair was taken by Mr. Gerald C. Horsley, F.R.I.B.A., the President.

Mr. Herbert A. Hall, Hon. Secretary, read the names of forty-three candidates for membership. He also announced that the next meeting of the Camera, Sketch, and Debate Club will be held on October 24, at 8 p.m., when a paper entitled "Craftsmanship and Architecture" will be read by Mr. L. M. Philipps.

The President proposed a vote of thanks to Mr. Edwin Gunn for presenting a collection of about 200 interesting negatives of architectural subjects to the Association. He also announced that the Hon. Librarianship is vacant, and that there is one vacancy on the Council. Nominations for same may be made at the next meeting.

Prize List.

Mr. Gerald C. Horsley next distributed the prizes and medals gained during session 1911-12 by the following students:—Mr. R. M. Pigott, A.A. silver medal; Mr. V. O. Rees, Banister Fletcher Bursary; Mr. W. J. Palmer Jones, Architectural Union Company's prize; Mr. H. J. Higgs, Class of Design prize and bronze medal; Mr. W. G. Newton, A.A. essay prize and silver medal; Mr. W. S. George,

Herbert Batsford prize; A.A. Travelling Studentship, first prize, not awarded; Mr. B. W. Ridley, second prize, A.A. Travelling Studentship; Mr. M. T. Waterhouse, history, first year, Day School (equal with A. S. Furner in studio prize, first year Day School); Mr. A. S. Furner, construction and free hand drawing (first year, Day School) (equal with M. T. Waterhouse in studio prize); Mr. H. J. H. Dicksee, Travelling Studentship (second year, Day School); Mr. H. G. Satchell, special prize given by headmaster (second year, Day School); Mr. E. C. Davies, end of session test, second year (prize given by the President); Mr. H. A. N. Medd, book prize, first year, Evening School; Mr. F. W. Mackenzie, second prize, first year, Evening School; Mr. J. B. M. Walch, scholarship, second year (first place in materials, first place in history); Mr. E. K. Smith, book prize, second year, Evening School; Mr. D. J. Gordon and Mr. T. W. Dowsett, equal, third year, Evening School prize; Mr. A. T. Hardman, Travelling Studentship, fourth year, Evening School; Mr. T. F. Ford, second prize, fourth year, Evening School, first place in history; Mr. T. F. H. White, first place in history. The following students have been awarded the Association's two years' course certificate:—Messrs. E. C. Davies, H. J. H. Dicksee, J. S. Hodges, H. G. Satchell, H. G. Tebbutt, R. S. Wallace, W. W. Locke, A. F. Hooper.

Mr. G. C. Horsley then delivered the following presidential address

On the Training Afforded by the Architectural Association and its Value in Promoting the Progress of Knowledge in Architecture.

Ladies and Gentlemen,—On rising to address you, as is the custom of Presidents at the opening meetings of the sessions, I feel I should offer you some sort of apology for troubling you again in this capacity. Your suffrages, as I believe they are called, have placed me in the position of your President for a second year, so I may fairly claim that you are yourselves responsible; but I, too, am not quite guiltless, for when I was asked if I would serve again I did not say no. I can only hope that the experience gained in my first year of office may help me in my second, so that you may not be too badly disappointed. To us all the business of the Association is of paramount importance. Last year in my address I traced, in some detail, the progressive work of the Association from its early days, when its membership consisted of its founders, through the many years of voluntary work and effort in its schools and classes, up to the formation some time ago of its School of Architecture and its present membership of something about 1,700.

Founded over sixty years ago by a few earnest men to fill a blank in their artistic lives, our society has consistently advanced along the path of progress and development. It began as a society founded by architects for architects, to assist them in acquiring a fuller and more complete knowledge of their art, and it is still, I am thankful to say, managed by architects for the same most excellent object.

This evening I will, with your permission, turn to a development in its work which the Council and those most interested in it believe to be one of no little importance. This is the institution of a third year in the Day School course in the School of Architecture. Hitherto, as you all know, the two years spent in the Day School have been chiefly of use to the student as an admirable introduction to the art of architecture. They prepared the way for the more advanced study in the Evening School in the third and fourth years, where much excellent work has been done. In the future the first two years will still fulfil these preparatory functions, and in those cases where a student cannot attend a third year in the Day School he will be able, as heretofore, to complete his course and obtain his certificate in the Evening School in the fourth year. But to those students who take advantage of the new institution I believe that time will prove it to be of great benefit. First, because, if good workers, they will be able to obtain their certificates in three years instead of in four; and, secondly, because they will be far better equipped for the work which will fall to their share on entering, as pupils or assistants, an architect's office. Here we come to a very important reason for the institution of this new régime. The complaint has been not infrequently made in the past that the two years' course was not a period of sufficient length to properly equip a man for work in an office; to meet this complaint the third year has been instituted.

Under the able direction of Mr. Robert Atkinson the all-important subject of design will be carefully studied, and it is the firm opinion of the Council that the prolongation

of the probationary period must prove to be of the utmost advantage to our Day School students.

In common with every member I should deeply deplore this development if I felt it would have any deterrent effect upon the custom of entering an office as an articulated pupil after the course has been completed and the certificate obtained. I do not believe that it will have this effect. We have made the Day School course a longer one in order that the student may be better fitted to enter an architect's office. This development was, in my opinion, quite inevitable. In view of the careful preparation for his future with which it is now necessary to provide the architectural student the period of study must be lengthened. In common, then, with the Council and with the Advisory Council, who have been consulted upon this important step, we may all look forward with confidence and interest to its success; all the more so because still further development is closely connected with this three years' course. This is that the student should enter the Royal Academy School for training upon its termination and during the time he is at work in an architect's office. The authorities of the Royal Academy have agreed to admit to their School without the usual examination, except in the subject of design, any of our students who have obtained their certificates after the Day School course. Thus, by the training given in this building, supplemented by the teaching at the Royal Academy, we shall have a continuous scheme of architectural education of the best and most interesting kind. It may be urged by some of our members and supporters, "But why this combination with the Royal Academy School? Why does not the Association undertake this advanced training itself?" Well, the reply to this is, that in advising our certificated students to enter the Schools of the Royal Academy for the completion of their studies we are availing ourselves of the successful educational organisation of that distinguished body. We are advising them not only to enter a school whose traditions and work are of the very best, but a school situated in a milieu essentially and vitally artistic. To master the principles of his craft in a congenial atmosphere is, for the student, a matter of the first importance. The artistic vitality, so well known to those who have passed through the course of teaching at the Royal Academy, is probably partly owing to the excellent system whereby most of the instruction is given by architect members, who act as visitors to the classes in rotation; and partly to the broadening influence of fellowship with young sculptors and painters, an association which frequently leads to friendships of lifelong, and also of professional, value, and tends to the formation of what I may call artistic character.

There will, of course, be in our own Evening School advanced training of a very thorough and carefully-prepared type. The Evening School has always been a great feature in our work, and it is to be continued and much improved. In it lectures will be given, which will be of use to all who are preparing for the Final Examination of the Royal Institute of British Architects. The work will be of an advanced description, but it will be more adapted for those who are only able to spend two years in the Day School and for those who are only in London for a comparatively short time.

Turning again to the advantages offered to a student by the Royal Academy, I must point out that the prizes which can be gained for good work are of great value. The principal of them is, of course, the Gold Medal and Travelling Studentship for one year's study abroad, of the value of £200, which is offered for competition every two years. Ever since its institution this prize has deservedly been the "blue ribbon" of the student's career.

It is gratifying to read in the annual report of the Council for the last session, on page 216 of the new Brown Book, that last year the following prizes were won by our members at the Royal Academy School—viz., the gold medal and travelling studentship (£200), by Mr. Alan Binning; set of architectural drawings (first prize, silver medal), W. L. Clark; an architectural design (prize £20 and silver medal), J. M. Whitelaw; set of drawings of an architectural design (first prize £15 and silver medal), V. O. Rees; second prize (£10) and bronze medal, Cyril A. Farey. As this list includes nearly all the prizes open to architectural students in the Royal Academy, you will, I am sure, join with me in heartily congratulating these successful competitors, and agree with me in thinking that it is apparent our School of Architecture has already made up its mind as to how it is intending to deal with this matter.

But I should like to remind you here that the provision for the equipment of our architects of the future is not yet

finished. As you all know, the foundation of studentships at the School at Rome is now an accomplished fact. No doubt the number of studentships compared with the number of competitors will be few, but, nevertheless, the institution of this important competition will tend to make our whole scheme of architectural education in this country more thorough. For although all competitors cannot be winners of prizes, all may be inspired to do good work.

I should also like to mention that, in order to increase the efficient working of our educational system, we have created a new post—viz., that of the Registrar. The Registrar may be called the Secretary of the School, and I believe that Mr. Scott-Homes, who has been appointed to fill this position, brings to it just those qualities which are desired. I am glad, on this the first public occasion since the appointment has been made, to give Mr. Scott-Homes a very hearty welcome on behalf of the Association. We have also in the last few months made some alterations in our building, which, we hope, will add to the comfort of our members. I refer particularly to the new members' room on the first floor and the redecoration of our meeting-room.

I regret that time will not permit me to speak to-night in any detailed manner of the many interests of the Association; for instance, of the meetings, the excursions abroad and at home, the "Sketch-Book," the Camera, Sketch, and Debate Club, the Athletic Club, and others. I must refer you to the "Brown Book" for information about these. I will merely remark that we are looking forward to a year of much activity in all these matters.

But I will call your attention to two events which are recent and of interest to us all. The first is the appointment of our new Secretary, Mr. Yerbury. The Council and those members of the Association who know Mr. Yerbury and the hard and good work he has done for the A.A. in past years view this appointment with satisfaction. I feel, I may say, that he has the best wishes not only of our own members but of the profession in general on his new appointment.

The second event to which I wish to draw your attention is important not only to some of our younger members, but to the many assistants and workers whom we find in architects' offices throughout the country. I allude to the new Insurance Society which has been formed under the National Health Insurance Act, and which is called the Architects' and Surveyors' Approved Society. This Society has been created under the auspices of our Association in conjunction with the Royal Institute of British Architects, the Surveyors' Institution, and the Society of Architects. It has made a most excellent start, for a large number of members have been enrolled already. It is not only appropriate that under the new conditions imposed by this Act of Parliament those working in our profession and in the profession of the surveyors and who come directly under these conditions should have a society of their own, but also that the formation of this society should have originated with the A.A., for in our ranks a large proportion of the future members will be found. Of course, most of these members will only remain under the Act for a short time, but their contributions during that period will allow for a gradual accumulation of necessary funds, which will permit of the granting of useful benefits to those who may require them.

For the formation of this new society our thanks are due to several of our members and to our Secretary, Mr. Yerbury. All these gentlemen have given generously of their time and have worked hard during the last few months to ensure the success of the new society; and it must be gratifying to them to see the successful beginning which has been made. For the present the office of the society is in this building, and Mr. Yerbury has superintended the initial work. A general meeting of the society will shortly be held, when doubtless further arrangements made necessary by its growth and expansion will be discussed.

In considering the progress which the Association has made during the past year we cannot but pause for a moment to remember the sad loss which we suffered so very suddenly last autumn. I mean in the death of Mr. D. G. Driver, who for so many years had worked with so much energy and enthusiasm in the interests of our society as its Secretary. It will, I am sure, be of interest to you all to know that the kind response to the appeal issued by our Hon. Treasurer has enabled our trustees to come forward and make such arrangements as will best help Mr. Driver's widow and young children. In the death also a few months ago of Mr. T. M. Rickman, F.S.A., we have lost our senior member and past-President. Mr. Rickman was elected a member of the A.A. in the year 1852. He was therefore one of its

THRONHJELM CATHEDRAL.—WEST FRONT.

founders, and was President in the year 1854-55. To the last he took the utmost interest in the doings of the A.A., and only last year I had a letter from him in which he regretted his inability through illness to attend the first meeting of the session.

My reason for devoting, however inadequately, this paper chiefly to the work in the School of Architecture is twofold—first, to point out the new development of our system; secondly, to remind ourselves of the real purpose underlying all our efforts—namely, to help forward the course of our art, and to hand on the torch, as M. Gaudet has said, to our successors.

In my address last year I emphasised the necessity of our education being based upon the principle that art is unity; in the words of Alfred Stevens, "I know but one art." I referred also to the wise provision made many years ago in France by the great Minister Colbert for the education of the artists of his country in Paris and in Rome. I ventured to state that it was this very thorough system of training which helped Labrousse to build his library of Ste. Geneviève in Paris and his notable additions to the Bibliothèque Nationale, which helped Duban in his building at the Beaux-Arts and Duc at the Palais de Justice.

I think we may claim for the continuous course of training, including the advanced course at the Royal Academy which the Association has now adopted and which I have described to you this evening, that not only is it founded on the principle of the unity of art, but that, through its conjunction with the opportunity for further study offered by the British School at Rome, we are instituting a "very thorough system of training" in this country.

The opportunities for architectural work in the future promise to be many. Cities will be rebuilt, and new cities, at home and abroad, will be needed. It seems to me that no thought can be more inspiring to a young architect than that of adding to the beauty and nobility of our Empire and to the health and happiness of its inhabitants. The study necessary to make us fit to take our proper part in this endeavour is so wide, so illuminating and interesting, and the aim of it is so high, that we may well believe our profes-

sion to be of the noblest—one of those to which a man is proud to belong. To it we must bring the best accomplishment, the best work that is in us, all our imagination, all our vitality, and a genuine enthusiasm.

Mr. Paul Waterhouse, in proposing a vote of thanks, said he would like to congratulate the Architectural Association not only on having secured from Mr. Horsley another year of office, but also to congratulate Mr. Horsley himself on the very interesting address which he had just given them. Mr. Horsley was a man of very wide architectural sympathies, and he might have been tempted to give them a discourse on the wider issues of architecture; but with great restraint he had brought himself within the compass of the Association. Having last year dealt with the past of the A.A., Mr. Horsley had this year dealt with its future. Education, like other processes of manufacture, is more or less a secret process—i.e., outsiders do not take a sufficient interest in it to be aware of what is going on. Neither teachers nor taught think it worth while to write about what they are doing any more than farmers or cooks talk about the excellent work they are doing. The taught, like the eaters, never seem to think it a remarkable thing that they are growing visibly. It is astonishing how few people do give any attention to what is going on educationally. As external examiner to the A.A. he enjoyed an opportunity to gain a bird's-eye view of what was happening there. He had to admit that it had been a revelation to him as to what could be done in the course of three or four years. This was especially noticeable by comparing the work of a man at the beginning and at the end of his course. He considered that the work was very ably done and showed great sympathy between the teachers and the taught. Everyone had been told that it was impossible to make a silk purse out of a sow's ear; but he believed that in the A.A. classrooms they would make a very good substitute for one. However, he understood that there was some special machinery for conveying to an unlikely student the knowledge that his talents might shine better elsewhere. He sincerely hoped that pupilage, or some substitute for it, would never be entirely abolished. In this connection it might be worth while to remind the younger

generation present of what the generation behind the speaker did. There can be no immodesty in pointing out that the men of that day did a rather fine thing. Up to that time teaching in architecture was practically confined to offices, which fact brought, of course, some grist to the architectural mill, though not every pupil was a good investment. But the architects of that generation said to themselves, "We must not let any consideration of that kind stand in the way. The thing is that the young men of the future must be educated in the best possible way." Accordingly they boldly set going what has now become a serious rival to the old-fashioned pupilage. The important thing was that besides an excellent academic education there should be some arrangement by which a young architect should still come into close touch with the architect whom he may regard as his father in art. Mr. Horsley had alluded to their loss in the death of Mr. Driver; he (the speaker) for many long years personally experienced the energetic work which Mr. Driver had done there. Mr. Horsley had also alluded to the late Mr. Rickman. To many of those present Mr. Rickman would be unknown; to others he would only be known as a quantity surveyor. He might say that Mr. Rickman was almost the father of quantity surveying, for he had very largely to invent the profession. To him personally Mr. Rickman was a very old friend, and he knew him to be a very kindly, scholarly, and interesting man. Mr. Rickman possessed a fine library of books, of which he had more than a superficial knowledge, and he was ever ready to lend them. Mr. Rickman had once remarked that if ever a man was born with a pair of silver dividers in his mouth it was himself. With regard to the prize-winners of the A.A., he might mention that while in the course of years he had had to read through an enormous number of essays for the R.I.B.A., he had very seldom read one up to the level of that which received their Essay prize. The future seemed to be a very bright one for architects. Various aspects of it had been pointed out by Mr. Horsley. He hoped that in the future the A.A. student would make a very great mark.

Mr. Curtis Green, in seconding the vote of thanks, said that they all looked forward to that particular meeting more than to any other, and he wondered whether it would not be better to hold it at the end of the session when they had earned it, rather than with their work lying all before them. They might then on the wave of enthusiasm caused by the address enlist the services of men like the proposer of the vote of thanks for the coming session. The Association wanted men preoccupied with architecture as a living thing. The latter often said their art unfitted them for routine affairs; but he felt sure the Architectural Association will do this art as much good as they will do the A.A. For, after all, architecture is concerned with the facts of life. The President's address usually fell into two headings: the activities of the Association and the source of inspiration or driving power of the student of architecture. Important as were their domestic affairs, that which interested most was the force behind them. This year the President gave a full account of the new third-year course in the Day School, and of the bond between this school and that of the Royal Academy. Educational matters move so slowly that the more they could unite and concentrate their efforts, the further they would advance. The little rivalries between the schools are doubtless but healthy signs of keenness, and yet he confessed to a hope that they might see one great school of architecture for London. Under Mr. Maule's guidance their own school had for a long time been the most considerable school of architecture in the country, and the third year's course will still further strengthen it. The men that are passing on out of the school are also a source of strength to it. It is perhaps as well that it is only as they further advanced that they realised the nature of their adventure. Material things press, efficiency and technique are hard to acquire, examinations overshadow. Yet those who look for and learn only the facts and formulæ likely to be useful in examinations, or in professional practice, though they may advance themselves, will hardly forward the architecture of their time. It is not the fashion just now for young men to dream dreams, or old men to see visions; nevertheless, it is the imaginative outlook that matters more than all else. Emerson says somewhere that the most surprising thing about a work of genius is that we recognise in it our own rejected thoughts; they come back to us with a certain alienated majesty; and he says that we must learn to detect and watch that gleam of light which flashes across our minds and not dismiss it because it is our own.. In

conclusion, he would refer to the debt that the Association owed to two of its members during the past year. The first, of course, was their President, whose never failing tact and engaging courtesy together with a certain valuable wait-a-bit wisdom, has endeared himself to all. He had been the polished corner-stone against which the unwary and headstrong run without injury. The other man was the Hon. Secretary, to whom they were indebted for an unusually strenuous year's work. Mr. Hall had carried their affairs through a difficult time with a certainty and ease which promised well for the future of the A.A.

Mr. W. H. Seth-Smith said he considered Mr. Horsley had given an inspiring address, because if there was any failure or inefficiency in the present mode of training it was in the higher branches of it. They had always felt that what was wanted was an advanced course which would, at any rate, approximate to the admirable system which obtains in France. They could therefore congratulate the A.A. on its policy and on removing what has been a distinctly just criticism. Within the year they had had two new departures: the first was connected with the Association, and the other was the British School at Rome, which gives promise to be equivalent to the great French Prix de Rome. He shared the hope that the approaching connection with the Royal Academy Schools will also supply a real need. They had every reason to hope that the third year A.A. course in the Day School will prepare men for making the best use of that great opportunity in the Academy Schools. He could not help feeling with regard to the Association and its classes that wherever students can see their way to continue in the Evening Schools it would be a great help to them. It was almost invariably dangerous to swap horses in crossing a stream. Mr. Horsley had opened up a vista of the possibilities lying before the younger members of the architectural profession. If ever a man is to be inspired he must be inspired with enthusiasm when he finds not only private clients commanding his services, but that, if he has abilities, he may even dream of designing new cities. We have at the present moment three new cities in prospect—viz., the Canadian project, the city of Delhi, and the Australian capital. No doubt there will be others also. The great question to be thought of is, "What is to be the principle to govern the design of these cities?" A great many of those present might have seen the very interesting letters in the *Times* which have attempted to solve that question. Lord Curzon and others think that nothing would be more applicable than our prevailing types of Renaissance. But the letter which was of the most interest and which appeared to sum up the situation was from Mr. T. G. Jackson. Mr. Jackson said:—"We should study works of art not to copy them, but to be impregnated with their principles; and if our study has done its work we should be so saturated with the true principles not of this or that particular style, but that of architecture itself, which is a very different matter, as to be ready for any novel conditions that may present themselves. Such conditions no doubt do present themselves at Delhi, and there could be no more splendid opportunity for a sensible development of architecture. The first considerations should be purely utilitarian: what sort of construction is demanded by the climate, the social habits of the inmates, and the functions the buildings are to fulfil. To think first of the style and try to bend and warp an old one to suit the case, is to begin at the wrong end, and will only ensure another of the many disastrous architectural failures of which India has been the field. The very difficulties that present themselves in the way of using a ready-made style should be regarded as the most fruitful source of inspiration for good design. That the forms should to a certain extent regard precedent is, of course, inevitable; we cannot forget the past, but they must not be fettered by any conventional formula. Whether they will be beautiful or not will depend solely on whether the architect is a true artist or merely an engineer. For the artist only differs from other men in this—that he does gracefully and beautifully the same things that the inartistic man would do, usefully perhaps, but unattractively." Some of those words might be written in letters of gold on the friezes of the A.A. studios. They summed up the principles which were the governing principles in their College of Art. It was seen that by adopting the right principles it was possible to attain the most satisfactory results. They could only hope that that would also be the case in the history of their Empire.

Mr. Walter Cave remarked that he had been extremely interested in the announcement concerning the Royal Academy Schools. Those present might not know that as

being done at Tufton Street. But a matter he always felt very jealous of was lest the classes should become so all-important as to destroy the other valuable influences. Personally he regretted nothing more than not having associated himself more with the general run of men of his own time. No one quite realises the great value to an architect of a large and intimate acquaintance among men of his own profession; the stimulus thus offered was enormous. Of course, there were people like Mr. George Devey who had carved out their own way and done most excellent work alone; but people of that kind were an exception to the average. If architects are to keep abreast of their time and feel the

impulses of modern developments it was necessary to know those working around them. They had to be professional men as well as architects. It was in such a direction as that that the Association proved so valuable. It was well-known that a good deal of the most important professional work was given out by architects themselves in the capacity of advisers. The latter's position was a very responsible one, for they not only have to find men qualified by their art, but by their business ability, tact, and all the other qualities. Consequently, however well they may know a man by reputation, they may hesitate to put his name forward owing to lack of personal acquaintanceship, for it was only by such acquaintance that a man can get to know of the existence of those qualities which are just as important as power of design. The help which one architect can get from another is most important and could not be overlooked. On entering one's first job unexpected difficulties arise. The young architect could then approach an elder, whose friendship he had earned on the sports-field or in the club, who would otherwise be unapproachable. Everyone acted and re-acted on each other, and it was by that action and reaction that general progress was made. Part of the value of the Association was in the opportunity it afforded of meeting people who are to influence one and whom one is to influence. He sincerely hoped that all the activities connected with the Association would flourish, for time might be very well spent in the various clubs as well as in the various classes.

Mr. H. D. Searles-Wood said that as the oldest member of the A.A. present it gave him great pleasure to join in the vote of thanks. He was always a great believer in having new blood, and he was gratified to see the number of young men present whose fathers had been members before them. He hoped that the sons would keep up the old tone.

Mr. Horsley, in replying to the vote of thanks, said he was extremely grateful for the very kind way in which those present had received his remarks. The discussion had been most cheering and helpful, and he looked forward to a most pleasant year of office.

The next meeting will be on October 28, at 8 P.M., when a paper by Mr. Lawrence Weaver, F.S.A., Hon.A.R.I.B.A., will be read, entitled "Small Country Houses of To-day." The adoption of Council's report and balance-sheet for session 1911-12 will also come up. (Combined meeting with the Camera, Sketch and Debate Club.)

INSTITUTION OF MUNICIPAL ENGINEERS.

The fourth annual general meeting of the above Society was held in London on Friday and Saturday of last week. The proceedings opened on Friday morning with a meeting in the Council Chamber, 4 Southampton Row, W.C., when the annual report was presented, a new Council elected, and a presidential address delivered by Mr. Frank Latham, M.Inst.C.E.I., borough engineer and surveyor at Penzance.

After an interval for lunch the meeting resumed with a discussion on four papers, which were taken as read. The subjects were introduced in a few words by their authors. The first paper presented was by Mr. F. W. Platt (Member), and was entitled "The Modernising of Building By-laws." It was as follows:—

Mr. F. W. Platt, in introducing his paper, said he would like to ask members to make themselves thoroughly familiar with modern materials. In the hands of an unscrupulous person reinforced concrete was a most dangerous material. He suggested that when any member has any new form of construction brought under his notice he should communicate the fact to the secretary of the Institution.

The recent circular letter of the Local Government Board to local authorities directing attention to the need of reviewing the existing codes of by-laws in operation in the various local governing centres of England and Wales is deserving of much attention.

By this letter the Board recognise that the use of modern materials and modern methods of construction is neither adequately nor precisely sanctioned in the Model Code, which was first issued in 1877, and has from time to time been extended and revised, but is still mainly in its phrasing identical with the original issue.

That the Board have until now shown reluctance to modify or revise their code, upon which great care and forethought had been expended, is not to be wondered at; for anyone whose duty it has been to draft a building by-law will know how difficult it is to find words which, while being precise and fulfilling the conditions of statute law, furnish that *via media* which reasonable persons feel they can sup-

port. The Model Code has, on the whole, been serviceable. It now needs modernising, and the intention of the Board to do so is greatly welcomed.

By-laws dealing with new streets and buildings may be made under Section 157, Public Health Act, 1875; Section 23, Public Health Acts Amendment Act, 1890; and Section 24, Public Health Acts Amendment Act, 1907.

The object of making rules or by-laws might shortly be said to be this: that every individual who decides to lay out any land for building purposes or to erect buildings thereon shall, in such laying out and subsequent development, provide at each building a quota of open space for traffic purposes and for domestic purposes, shall construct each building so as to provide against fire, be healthy in itself, be properly drained, be responsible for its share of the outfall sewer, so that all would collectively form a properly developed town.

That by-laws can be drafted which will be sufficiently comprehensive and explicit to furnish all the guidance needed to attain this is certain. They will not check building, as is popularly supposed. They will ensure good building.

The authors of the Model Code in drafting the earlier forms of by-laws had regard mainly to buildings of stone or brick construction, and, apart from what is considered their restrictive character, they are inappropriate to types of construction now in use, such as buildings of hollow blocks or slabs of terra-cotta, concrete, reinforced brickwork, &c.; for hollow or half-timbered walls, and steel or other framed walls hung with tiles, slates, &c., filled in where necessary with incombustible materials; for buildings where piers are employed, and where large window openings are needed; or for the thickness of walls of outbuildings.

Again, the ordinary clauses for the laying out of roads do not permit of the class of roads which have been designed in some garden cities, neither do they differentiate between the type of paving needed for varying grades of roads or for exceptional arrangements which are demanded in certain cases by the configuration of the ground. In a few words it might be said that the Code is voluminous without being comprehensive, and is too restrictive. It deals with details rather than types.

What form should modernising take? Take the question of walls, floors, and roofs—that is, to ensure "due stability" in them. Should not the knowledge of the behaviour of materials be utilised in determining the various sizes of the respective parts rather than tabulated sizes of the thickness of each wall or of the materials being set out in the form of a by-law? For example, the present Model Code prescribes that buildings shall be enclosed with walls termed external, party, cross or return walls constructed of hard incombustible materials such as good bricks, &c., and then proceeds to give the thicknesses of the walls according to the particular height the wall is to be erected, neglecting entirely whether any loads were to be transmitted to such walls from floors or subsequent loading when in use.

In this matter of loading it is common practice to find that the joists of buildings of the cottage type were rarely built into party walls, but often are supported upon a wall half-brick in thickness and an external wall, the thinner wall thus carrying a greater proportion of the weight of the building than the thicker external wall. Obviously such an external wall, if built of the by-law thickness, might be either too thick when not loaded or too thin when loaded. The Code does not recognise a wall half-brick in thickness, nor does it, under such conditions as here mentioned, prohibit its use. Another fallacy is where almost the whole of a storey is required as an opening. The Code here requires sufficient piers to be provided, or in some cases storey posts, but never states what a sufficient pier or storey post is, or how such is to be determined.

Again, modern buildings of the warehouse type are rarely simple in construction. They are often built upon highly valuable land which leads to a varying distribution of the loads supported by the floors, whose strength has to be determined by the loading circumstances of each particular case. To apply a model code based upon a universal system of high loading to such buildings would result in unnecessary expense being incurred in the thickness of the walls or strength of the floors, without necessarily providing uniformity of strength throughout the building.

Therefore, if full advantage is to be taken of this opportunity to revise an existing code of by-laws, consideration should be given to the desirability of including in the revised code power to determine that the various parts of at least buildings of the "public" or "warehouse" class

should be so designed that when loaded as intended the buildings would be in equilibrium throughout. Obviously much care would be needed to draft governing regulations. The following points, however, might form the subject of consideration:—

1. The type of building and the purpose for which it would be erected.

2. The type of material to be used in its erection.

3. The maximum stresses permitted in such materials.

4. The method of calculation to be followed in determining the resistance of the materials, and the effect of the loading on the various parts for the determining of both external and internal forces.

5. The extent of the details required from the building owner to enable the local authority to be satisfied that due stability would be obtained, and the nature of the declaration that the building would be duly supervised during construction.

6. The nature, type, and extent of the tests to be made during and after erection to ascertain that the above conditions were fulfilled.

7. The guarantee that the building would not be internally stressed to an extent exceeding the designed resistance.

Some such regulations would at once provide all the power that a local authority needed to ensure "due stability" in every portion of buildings other than those of the domestic type, and would remove from the Code all those cumbrous rules respecting thickness of walls and their attendant variations, consequent upon some contingency often more or less remote.

In matters of means of egress, disposition of seating in public assembly rooms, position of staircases, situation and type of sanitary accommodation in buildings, all could be more usefully regulated by taking into account the type of construction of the building as well as the nature of the business or undertaking to be carried on therein. What always obtains under the Model Code is that a minimum of structural stability, based upon an ordinary use, is prescribed; and this becomes in practice an actual maximum.

Domestic buildings would require different treatment to public or warehouse buildings. They are subject to greater changes and different usage. Yet modernising even in their "structural stability" by-laws is possible. Why should walls require footings if resting upon sufficient concrete or rock foundation? Why should parapet walls be needed, with all the risk of conveying moisture into the houses? Why should window frames be required to be set back 4½ in. from the face line of buildings? Why should overhanging eaves be prohibited, considering all the protection from dampness they afford to the walls beneath them? Many other questions could be usefully asked by those revising by-laws.

And the inquisition could be carried on throughout those by-laws which are made for "purposes of health." Why should isolating traps with their ground level inlets be demanded? Why should not power be obtained to enable a regulation to be made governing the cubic contents of a room, and prescribing the ratio between height, length and width of all living-rooms instead of the present one dealing only with height? Should not a regulation be possible requiring all dwelling-houses to be provided with a pantry or larder, and also that all living-rooms should have at least one window in them through which the sunlight can pass every day the sun shines? By-laws dealing with the construction, direction, width, length and paving of streets should be carefully modernised. Should not regulations be made enabling the owners of streets to complete them with dustless paving rather than with the ordinary sett paving, which is often laid with open insanitary joints?

The limitation of the number of houses or other buildings in a row should be considered, and rules prescribed to direct that the course of streets should be such as to enable the maximum amount of sunlight to pass into the buildings erected upon their sides; and to further make provision for the encouragement of open spaces at the front in addition to the land set apart for street purposes, the latter of which might be reduced in width if additional space were provided for use as garden land in front of buildings. Some balancing clause, whereby this type of laying-out would be made possible, would have an encouraging effect upon the minds of persons who would be considering the development of land, especially if the effect of the clause would be to reduce the cost of street works, which oftentimes is greater than the value of the land for which the works are undertaken.

Many other points might be adduced to show the need of

modernising, but one question should be kept foremost in the mind of those considering the subject, and this is it: That the local circumstances should be fully considered before determining the phrasing of any particular regulation.

While much might be learned by a careful perusal of other local authorities' by-laws, it would not be wise to blindly follow a by-law made for similar purposes by another authority, unless it was found to precisely and definitely express the exact needs of the authority desiring to adopt it. For experience does not confirm the desirability of accepting without question a by-law or regulation made by another authority upon some subject which is under consideration. This, together with a code of by-laws framed upon the knowledge obtained of the behaviour of materials under modern loading, would place a local authority in possession of by-laws freed from the objectionable features attributed to the present Code—namely, their elasticity and applicability only to stereotyped forms of construction. Some local authorities might urge that a code based upon these suggestions would be expensive to administer, because a technically trained staff would be required for the work; but as buildings in themselves are an essential indication of a town's prosperity, and are vitally necessary not only for the town's business but also for the housing of the population engaged in such business, it is not unreasonable to claim first importance for the subject. That men in the service of local authorities are capable of administering a code of by-laws based upon technical knowledge is beyond doubt; and it is not too much to say that such a code would receive the approval not only of the members of professional societies engaged in construction, but also of all whose desire it is to have well-developed towns with soundly constructed buildings therein.

Mr. Horace Cubitt, A.R.I.B.A., in opening the discussion, remarked that the subject of building bye-laws was not an easy one, and did not always receive the attention it should do. Personally he was able to look on it from a useful standpoint, as he had had both to supervise and to obey bye-laws. There could be no doubt that the necessity for modernising the codes of various districts was becoming an urgent matter. The subject divided itself into two parts, viz., the bye-laws for ordinary forms of construction and those which apply to special forms. As regards the first class, there were, in his opinion, a great many cases in which there was room for amendment. He had no hesitation in affirming that there was no constructional necessity for houses of three storeys to be built of 14 inch walls. It would greatly help the progress of cheap and sound building if the requirements were modified so as to admit in certain similar types of the use of 9 inch walls. Apparently the Local Government Board are willing to allow each authority to act on its own in this matter. There is a good deal to be said in favour of each town having its own special ordinary building bye-laws owing to the manner in which materials and details differ. But when one came to steel and reinforced concrete construction it did not seem to him that it mattered whether one built in Cornwall or in Caithness. It would be an exceedingly difficult matter for each authority to frame its own standard of requirements for this class of work. It would be quite sound to take the report of the R.I.B.A. as a common basis. But if the London County Council frame a model code for ordinary buildings they may frame a code for this type of construction, where it was even more wanted. Such buildings as warehouses should not be treated by hard and fast rules.

Mr. Adams, in the course of some remarks, said the question of load on floors was a difficult one. It makes an enormous difference in the design as to how the load is to be applied. A man might want to put up a very cheap building for a particular purpose and he might make his loads as low as he could persuade the surveyor to pass. But it did not appear to him to be advisable to pass such a building, for in the course of years it might be let to other trades where a different floor-load altogether prevailed. The only satisfactory way is to have a figure which experience shows to be as low as is safe and as high as is likely to be required.

Mr. Frank Latham said that one point had struck him, viz., that the Institution could take this matter up as a small committee. It would be invaluable if such a committee would consider the subject and then give the fruit of their labour to the members who have to deal with reinforced concrete structures in the country.

(To be continued.)

FRENCH RENAISSANCE ARCHITECTURE.—I.

THE first of a course of ten public lectures on "French Renaissance Architecture" was delivered last week at University College, Gower Street, W.C., by Mr. W. Henry Ward, M.A., A.R.I.B.A. It was entitled "Introductory: The Renaissance in Italy and Other Countries."

The great wave of change which we call the Renaissance, said Mr. Ward, gathered in Italy in the fourteenth century and swept over Europe, enveloping France in the fifteenth and England in the seventeenth century, transforming the mediæval into the modern world. The Middle Ages were the Ages of Faith; their spiritual fervour was well expressed in the Gothic cathedrals, while feudal castles show the violence of the social order. But, as the Middle Ages wore on, chivalry and mysticism gave way before an inquiring spirit. Renaissance architecture arose to express a new order of ideas to which Gothic no longer corresponded. A new style endowed with some of the qualities of ancient architecture must inevitably have been evolved, because Europe was after a thousand years approaching the state of civilisation and thought of classical antiquity. That this new style became based upon Classic was due to the fact that the new movement started in the old centre of the Roman Empire.

Italy, so to speak, the least mediæval country of Europe, was in the fourteenth century on a higher plane of material and intellectual culture than any of the other countries. The dissensions of Italy had contributed to prevent her ever developing a truly national Gothic style, and her local styles retained almost throughout the Middle Ages much of the principles of Classic. It is not surprising that Italians should have gone direct to the Roman monuments when they sought new architectural expression rather than to the Goths and Lombards, who had destroyed them. In the early Tuscan Renaissance there is hardly anything that can be described as copying of Roman buildings. But native types are treated with a new sense of dignity, order and proportion, with a more skilful and logical application of elements hitherto used confusedly or clumsily. Later in Lombardy and Venetia the change went less to the root of the matter and resolved itself largely into the rather ostentatious adoption of a new type of decoration. This early phase was succeeded in the late fifteenth century by another which may be termed the Roman or "Advanced" Renaissance. It more closely followed the ancient examples, though it was rather a development of the Florentine than of the North Italian Renaissance. Its real founder was perhaps Alberti, who exercised a powerful influence through his writings as well as his buildings. Alberti's contemporary, Bramante, who was less a theorist than practising architect, arrived independently at a similar position, but went beyond him. This further-developed new manner was practised during the early sixteenth century by a brilliant group of architects, the San Galli, San Michele, Peruzzi, and Raphael; and from Florence and Rome spread to all Italy.

This Golden Age was of short duration, and ceased at the sack of Rome in 1527. Subsequent architecture soon began to run in two main streams. On the one hand the art of design became an exact science and tended to lose its vitality; while on the other an opposite school, headed by Michel Angelo, scorned all rules. In the late sixteenth and throughout the seventeenth centuries the latter was chiefly in the ascendant, producing the Barocco and Rococo styles. In the eighteenth century the pendulum swung once more decidedly to the puristic school, and new direct study of ancient architecture began.

In France during the early years of the fifteenth century anarchy reigned supreme, until the heroism of Joan of Arc and the astuteness of Charles VII. and Louis XI. gradually brought order out of chaos. France became a great power in Europe. But her mediæval institutions and ideals had been shaken. At first the architectural revival followed the old traditions. But the inspiring ideals were gone, the problems all solved, so there was nothing left for the builders but to embroider on old themes. It was an architecture of unrest. Here and there, said Mr. Ward, we may discern gropings after something broader and simpler, more regular and reposeful. There was a marked tendency to substitute curved for pointed forms. An easy transition to Classic was provided by the florid form of the Italian Renaissance with which the French first came into contact. By this time the Church had fallen from her position of supremacy into second place, the forces of secular life taking the lead.

The next lecture will deal with "The Beginnings of the Renaissance in France, the Italian Craftsmen, Charles VIII. and Louis XII."

THE SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

SEVERAL matters of more than ordinary interest were referred to at the opening meeting of the Sheffield Society of Architects and Surveyors. The President, Mr. J. B. Mitchell-Withers, alluded to the inadequate representation of provincial Societies on the Council of the Royal Institute, and other speakers dealt with the decrease in the number of students entering the profession.

The President, in his inaugural address, first referred to the pleasure he had derived from being during the past year the representative of the Sheffield Society on the Royal Institute Council. From what he had seen and heard, the Metropolitan architects attached great importance to the views of the provinces expressed by the allied societies. There appeared, however, at present to be no adequate means of effectually expressing the opinions of the provincial members as a whole. If it were possible to have more inter-communication between the provincial Societies and to obtain a greater and more permanent representation of provincial men on the Institute Council, that would tend to the benefit of the profession as a whole. It was the concentrated and combined opinion, after an interchange of views between allied Societies, that was needed to be of value and to carry any weight.

He saw that some of their younger members were associating themselves together this session with the object of having lectures of their own. He wished them every success, and hoped the scheme would be well supported. One of the most valuable acquirements that could be cultivated in early life was the art of teaching oneself. It helped the student to profit more from the teaching which he received from others, and increased the faculty of discriminating in the choice of that which should be vividly impressed on the memory for future use. He advised them to adopt method in all things, and not to get into the habit of putting off until to-morrow those things which were disagreeable. In studying the life history of various architects, he was struck with the fact that their success depended largely on the habits and methods they had formed when young, and which they were able to apply satisfactorily when the call to real work came.

Mr. A. F. Watson, in moving thanks to the President for his address, agreed that it was a pity that more members of the allied Societies had not the opportunity of being elected on the Royal Institute Council. There might be very prominent and clever men in London—no doubt there were—but there were also some in the provinces.

Mr. E. M. Gibbs, who seconded, thought when the Institute were reconsidering their charter the provinces should ask for larger representation. At present Sheffield could only be represented about once in three or four years, and that was a very small share of representation for a Society like theirs. He did not see why the London people should rule the roost, and in many cases, he regretted to say, misrule it.

Another matter mentioned by Mr. Gibbs was the remarkable scarcity of young men entering their profession. Whether they had got the reputation of being a hard-worked and poorly-paid profession he could not say. He supposed that must be it, for many of the young men of to-day wanted to be well paid and do little work. But it was certainly strange that so few were entering the profession, and that there were such a small number of students in the Department of Architecture at the University. It was certainly not the fault of the lecturer, but if the young men would not come forward they could not send them to the University. It was rather a pity that they had not better support for such an excellently equipped department.

Mr. H. L. Paterson, speaking in support, referred to the scarcity of the students in the profession. But he did not see what they could do if the young men would not come in. If there was some way of burning down the half of Sheffield it might be a good thing for Sheffield, and incidentally might benefit them.

The resolution was adopted with great heartiness.

The President, in his reply, thought there were a great many more architects to-day than in times gone by in proportion to the population, and unless in some way the work increased it was possible that there would be less pay. They must also remember that a great deal of important work was now undertaken by public bodies, he believed at much greater cost than formerly. He did not say that was so in Sheffield, but it certainly was in some places, and probably the fact that a great deal of the work which was prepared was never carried out accounted for some of this extra cost.

The Architect.

FORTHCOMING EVENTS.

Saturday, October 26.

Royal Sanitary Institute: Provincial Sessional Meeting at Alton, Hants, at 11.15 A.M.

Monday, October 28.

Architectural Association: Paper on "Small Country Houses of To-day," by Mr. L. Weaver, F.S.A., Hon. A.R.I.B.A., at 8 P.M.

Thursday, October 31.

London University: Course of Lectures on "French Renaissance Architecture" by Mr. W. H. Ward, M.A., F.R.I.B.A., at University College, London, at 6 P.M. (4)
"The Mature Renaissance: The School of Fontainebleau and the First French Architects. Henry II."

Monday, November 4.

Royal Institute of British Architects: President's Opening Address at 8.30 P.M.

Wednesday, November 6.

Nottingham Architectural Society: Exhibition and Criticism of "Constructional Details and Testimonies of Study" by Mr. W. R. Gleave, A.R.I.B.A., at 8 P.M.

RURAL BY-LAWS.

A PROVISIONAL draft has been issued by the Local Government Board of Model By-laws which, presumably, are intended to meet the serious objections that have been raised to those hitherto existing as causing unnecessary expense in the erection of small houses in rural districts, and rendering it practically impossible to build cottages that could be let at a rent within the means of the ordinary farm worker or others for whose occupation they are intended.

These draft by-laws are, from the alternative form describing the Authority by whom they are purposed to be made, intended to be applicable to boroughs as well as to urban and rural districts. They may, therefore, be understood to be expected to meet the desirable modification of present by-laws for the development of garden cities, suburbs, and villages. We recognise that the requirements of these new forms of social settlement have, at any rate to some extent, been met by the provisional draft, and certain artistic methods of construction are now no longer practically prohibited, and we also think that the cheap cottage will be somewhat nearer realisation in districts to which these revised by-laws would apply.

Dealing first of all with domestic buildings, it is now possible to construct a cottage or a pair of cottages unfettered by rigid requirements for the external walls. These cottages must be not more than two storeys in height. They must be separate buildings or part of a block of buildings containing not more than two. They must have foundation walls not less than nine inches thick constructed of good bricks or stone and good mortar or other hard and suitable incombustible material, properly and solidly put together. These walls need only be carried to a height of six inches above the surface of the ground, and must be provided with a proper damp-proof course of sheet lead, asphalt, slates laid in cement, or other not less durable material impervious to moisture, or as a substitute for these walls sufficient piers of good brick, stone, or other hard and suitable material, or of good cement concrete having proper footings, may be used to support the building.

This exemption from the rigid regulations of construction of cottages is granted only to buildings whose capacity shall not exceed a certain number of cubic feet, which is not suggested in the draft but has to be determined by the local Authority. Similarly a cottage must be distant from the opposite side of the nearest street and from the boundary to any adjoining land or premises a prescribed number of feet, which has to be similarly determined.

We now come to modifications of construction applicable to garden cities, suburbs and villages. Provision

is here made that external walls may be hollow, but the regulations for hollow walls might, we think, be desirably amended. It is at present provided that the cavity shall throughout be of a width not exceeding two and a half inches; this, we think, is a mistake, and should rather read not less than two and a half inches. The only reason for limiting the width of the cavity is the presumption that this is necessary to ensure that the two parts of the wall shall be securely tied together; but provision is already made in a further stipulation that this shall be done with suitable bonding ties of adequate strength. If the ties are suitable and of adequate strength we see no reason why the cavity should not be wider than two and a half inches, and for many reasons the wider cavity is preferable. We are pleased to note that it is provided that a cavity shall be properly drained and ventilated. We do not, however, think that it is well for the by-law to rigidly prescribe that the thickness of each part of the wall shall be not less than four and a half inches, and that the aggregate thickness of the two parts, excluding the width of the cavity, shall be not less than the minimum thickness prescribed for a solid wall. This seems to us to debar the use of walls of reinforced brickwork or other material in which a stronger and more weatherproof wall might possibly be contrived with less thickness.

Hollow walls may also be constructed of hollow blocks of cement concrete, but here again there are stipulations which may possibly tend to stifle invention. The size of the cavity is limited to a third of the horizontal sectional area of the block, and also to a width of four inches. If the total thickness of a block, including the width of any cavity, is nine inches the width of the cavity is reduced to two inches by the stipulation that the substance at the sides of the cavity shall be not less than three and a half inches in thickness.

In all classes of hollow walls it is rightly provided that the heads of door frames and window frames, also lintels, if projecting into the cavity, shall be covered throughout on the upper side with a layer of sheet lead or other impervious material.

Timber-framed buildings will now be permitted under these model by-laws, when such construction is used for new domestic buildings either detached or in a block of not more than three houses, distanced not less than fifteen feet from any other building not being in the same curtilage, and not less than seven feet six inches from the boundary of any land or premises adjoining such curtilage not being a street. The timber-framed buildings are of two kinds; first, those in which the timbers are exposed, in which case the space between the timbers shall be completely filled in with brickwork or other solid and incombustible material, and a thickness of at least

four and a half inches of such material shall be placed at the back of every portion of timber.

In the other case the timber framing may be covered with tiles, slates, or other suitable incombustible material, for both storeys where a building is two storeys high, and for the two upper storeys where the building is three storeys high. Timber-framed buildings are to have their timber framing supported on a solid external foundation wall carried at least six inches above the level of the ground. Timber framing is also permitted for any part of an external wall of a domestic building constructed in the form of a gable or a bay for a bay window.

With regard to the footings there is a concession to the objections that have been raised to the existing regulations that is only half-hearted in character. If the thickness of the wall does not exceed nine inches, footings need not be used provided the wall is carried upon a layer of good cement concrete of sufficient thickness. This is a recognition of the fact that a sufficient bed of concrete may be a good support for a wall, but why this should not be recognised for a fourteen-inch or an eighteen-inch wall as well as for a nine-inch wall we cannot understand.

There is a provision made with regard to the construction of the walls of basements which, we think, is not quite happy. These walls will have to be constructed either impervious to moisture or as hollow walls, and it is required that the hollow shall be taken down to the base of the wall, and that there shall be a damp course at the base. We think that it will be rather difficult in some cases for the builder of such a wall to comply with the previous sensible stipulation that the cavity shall be properly drained and ventilated.

A provision is made in the new by-laws that the wall of a new building which shall be built of cement concrete or of reinforced concrete need only be of such thickness as shall be necessary to secure due stability. A concession is also made to artistic prejudices by a permission that party walls need only be carried up to the underside of the slates or other roof covering.

We may now turn our attention to the question so vital to planning on garden-city principles, the construction of new streets. It is provided that a new street intended for use as a carriage road shall be thirty-six feet wide at least; but where the main length of such street shall not exceed feet, and it is intended that the front main wall of every building erected in such street shall be distanced not less than feet from the centre line of such street, the width thereof may be feet. If the road is not intended to be used as a carriage road, and is not more than 100 feet in length, the width may be reduced to twenty-four feet, and it is provided that if the street is not to be used as a carriage road or for other buildings than dwelling-houses, the width of the street and the distance of the dwelling-houses from the centre line may be diminished to dimensions to be determined by the Authority adopting the by-laws. Back roads are, however, to be provided in such cases as a secondary means of access. The regulations, therefore, for the construction of roads seem to us to make due provision for laying out new districts on garden-city principles.

NOTES ON BOOKS.

"Kaemmerer's Practical Letter Book." Edited by A. S. Jennings. Containing several hundred alphabets in 140 plates, together with descriptive text, for the use of sign painters, show-card writers, decorators, artists, and craftsmen. By J. H. Kaemmerer, silver medallist. (London: Trade Papers Publishing Co., Ltd.)

For the sign writer this is a useful collection of examples, and for the architectural student who wishes to embellish his drawings with something new and fanciful there are suggestions which, properly studied, may prevent him from introducing into one word the characters of several alphabets. The novelty which

several will find is chiefly due to the inclusion of recognised alphabets from the Continent, particularly Germany and Holland. Many of the best of those that are known to English typography are, however, not to be found included.

"Pompeian Decorations." By R. A. Briggs, architect, Soane Medallist, Fellow of the Royal Institute of British Architects. (London: B. T. Batsford. 25s. net.)

Although it cannot be said that the three-colour process is a perfect one for the reproduction of all and any actual effects, it has by now attained such a considerable degree of excellence that in the hands of a skilful craftsman it can be made to render a very close approximation to the actual colour of painted surfaces or tinted material. It is at any rate up to the present the only means by which printed reproductions of colour can be produced except at exorbitant cost, and its employment has rendered possible the publication at a moderate price of Mr. Briggs's charming book on "Pompeian Decorations," in which, for the sum of twenty-five shillings, we have brought before us reproductions of the actual colourings and decorations of friezes, ceilings, walls, shrines, mosaic work, and the peculiarly Pompeian craft of using shells as part of the ornamentation.

Pompeian ornament for those who have been unable to see it on the spot has been almost entirely confined to monotone presentment, with occasional crude reproductions of the strident colour of work of the earlier period. It has remained, therefore, for Mr. Briggs to seize the opportunity that modern printing processes afford to give to those who are necessarily stay-at-homes some true impression of what the colour of Pompeii really was.

How valuable this information is one may well realise from a comparison of two plates in the book—one in colour of mosaic work and the other in monochrome, in which the various colours have to be indicated by the words, "yellow ochre," "indigo blue," "light red." It requires a vivid imagination to invest the latter with an informative exposition of the colour scheme. Mr. Briggs in his introduction gives a brief but useful sketch of the history of Pompeii and the main features of its domestic architecture. In this Mr. Briggs quotes the various styles into which the decoration of Pompeii have been classified by Mr. Mau, who has suggested the following divisions: (1) the incrustation style; (2) the architectural style; (3) the ornate style; (4) the intricate style. Examples of each of these are given by Mr. Briggs, and enable us to grasp the meaning of the classification and the full development of Pompeian decoration, and to understand how completely Greek or Hellenistic feeling dominated the character of the decoration, even when it was the Hellenistic of Alexandria.

We must not omit to mention that in addition to coloured plates there are several reproduced in monochrome, in which Mr. Briggs has given us examples of decorative forms which should be suggestive to those of us who are swimming in the tide of Neo-Grec.

"Building Construction and Architectural Drawing." By John A. Reid, architect, Licentiate of the Royal Institute of British Architects, teacher of Building Construction under the Glasgow School Board, Ardrossan School Board, and the Insurance and Actuarial Society of Glasgow. (London: Blackie & Son, Ltd. 4s. net.)

This publication is a portfolio of eighteen plates in black and white, accompanied by a small pamphlet containing a commentary rather than a description or explanation of the various pieces of construction drawn on the plates. These latter are, indeed, sufficiently furnished with information to require little explanation.

The essential characteristic of this publication which distinguishes it from others of a similar nature is that the construction is exemplified by the use of decent

designs, thus tending to instil into the mind of the young architect the important fact that design is the outcome of construction, and not something which can be learnt separately from it.

It is, perhaps, too much to expect that there should be no slips in the drawing of so many examples of construction, but we trust that when a new edition appears there will not be drawn a section of a hollow wall in which the moisture that penetrates into the hollow runs along the damp course to the wall plate; nor that curved trusses in modern roofs will be suggested as desirable, which have to be cut out of four-inch stuff twenty-four inches wide.

The lantern light for a billiard room might with advantage be made larger than the table, so that if it does leak or the euphemistic "condensation gutter"—which, by the way, is in the detail lacking an outlet—should overflow, there will be a chance of the drops falling clear of the table. The whole work is so excellently modern and up to date that we should like to see the few blemishes which it contains removed when a new edition appears.

"Longmans' Historical Illustrations. England in the Middle Ages." Drawn and described by T. C. Barfield. In six portfolios. (London: Longmans, Green & Co. 2s. 6d. net each.)

These portfolios contain a number of plates, with short descriptive text, intended to illustrate the architecture and customs of Medieval England from the eleventh to the fifteenth century, and whilst they may be useful in assisting boys and girls at school to think of history as something more than a matter of battles, treaties, and dates, they are scarcely sufficiently correct in detail, certainly as regards architecture, to render them capable of conveying more than an impressionistic idea of the part that it played in Medieval life. The architectural details are for the most part inaccurately drawn, and some of the construction indicated is absolutely impossible.

"Elizabethan Interiors." By C. J. Charles. (London: George Newnes, Ltd. 42s. net.)

This is a collection of cleverly drawn and well-reproduced illustrations of interior decoration, or rather architectural treatment, accompanying a sufficiently accurate, though not very detailed, description of the history of the internal treatment of domestic architecture from Norman to Georgian times. The drawings illustrated are of many rooms the author has carried out in England and America from old material that he has sedulously sought and carefully collected. Amongst these drawings of his own work are one or two others which have been specially designed and prepared for this book, to illustrate some examples characteristic of the earliest periods of English decoration. In short, the volume is a sumptuous business catalogue.

"Architecture. An Introduction to the History and Theory of the Art of Building." By W. R. Lethaby. (London: Williams & Norgate. 1s. net in cloth, 2s. net in leather gilt.)

This little book may be briefly described as a serious attempt to convey to the mind of the layman what in Professor Lethaby's view is the meaning of Architecture. Doubtless the principles of the art can be very well explained from the buildings of the most ancient periods, and perhaps better than from those of later date, for in those early days there was less affectation in art. Men then built as they wished to build, not as they thought they ought to build because someone else had set an example before them. Hence we can understand that of the 251 pages in the volume 199 deal with architecture prior to the thirteenth century. Of course, the tone of the book is tinged with Professor Lethaby's personal and peculiar views, particularly the exaltation of building above design as an element of architecture.

EWELL, CHEAM, AND NONSUCH PALACE.*

EWELL.

EWELL, in the Hundred of Coped-Thorn (Cophthorn), and in the rural deanery of Leatherhead, now forms a part of the Rural District Council of Epsom, and stands on a spot where the chalk of the Downs joins the clay district to the north-east, and at the junction of the two a number of pure water springs arise, forming the stream known as the Hogsmill River, which joins the Thames at Kingston. These springs, which can be seen rising from the roadway, not only furnished the name of the "Spring Hotel" (where we are now assembled), but probably gave Ewell its name, as the generally accepted derivation of the Domesday *Ætwell*, *Etwell*, or *Attewell*, is a corruption of *At Ye Well*. The older flour mill by the side of the stream has, no doubt, been there from the Middle Ages, and very likely stands upon the site of one of the two mills which were referred to in the Domesday Survey as being there, and then valued at 10s. It then belonged to the King, and continued in the possession of the Crown until 1156, when Henry II. gave all his lands in Ewell to the prior and canons of Merton. According to the author of "Greater London" (Mr. E. Walford, M.A.), Richard I. granted the prior and canons of Merton 101 acres of land at Ewell "without impeachment of assart" (which means that they might convert the woodland into enclosures of arable or pasture). On the suppression of the Priory of Merton, the manor reverted to the Crown, and it was annexed to the Honour of Hampton Court by Henry VIII. Queen Elizabeth afterwards disposed of Ewell to Henry Fitz Alan, Earl of Arundel, whose daughter Joan was married to Lord Lumley, and who died without issue, as the estate passed on to his nephew, Henry Lloyd, the son of Lord Lumley's sister Barbara by her marriage with Humphrey Lloyd, of Denbigh, the well-known antiquary. From him the manor ultimately descended to his great-grandson, Dr. Robert Lumley Lloyd, who became rector of St. Paul's, Covent Garden; and he, also dying without issue in 1730, left the estates, subject to his sister's life interest in them, to Lord John Russell, afterwards Duke of Bedford. The Duke, however, did not hold them long, as about the middle of the eighteenth century he disposed of the manor of Ewell to Mr. Edward Northey, of Epsom, the same gentleman who purchased West and East Cheam manor houses, which will be referred to later. The Northeys have for many years been lords of the manors of Ewell, Cheam, and Cuddington. The present lord of the manor is the Rev. Edward Northey, of Woodcote House, Epsom, which has been the seat of the family for many generations, and who is greatly beloved and respected in the neighbourhood.

THE WATCH-HOUSE.

The main street of Ewell is still quaint and interesting, with not a few of its old-time cottages and buildings to be seen dotted here and there, several being built in the time of the Crusaders after the Eastern fashion. It must be remembered, too, that Ewell long enjoyed a degree of importance, being the head of a deanery; and up to the middle of the seventeenth century a weekly market was held there, and sheep and cattle fairs took place twice a year, which brought breeders and buyers from all parts of the kingdom. A "Watch-house" has stood for centuries near the junction of High Street and Church Street. Here disorderly persons were locked up for the night, and taken to Epsom for trial the next morning.

THE CHURCH OF ST. MARY.

The present church, named after the old one—St. Mary—was built in 1848 (principally through the generosity of the Rev. Sir George Glyn), at which date its predecessor was pulled down, with the exception of the tower. For some time this tower was used as a mortuary chapel. As we saw it, it is now covered with thick ivy, and the outside walls are hardly visible. These are of flint, faced with worn stone, there being several courses of red brick in the upper portion. The old church was built of flint and stone and in the Perpendicular style. It had a nave, chancel and south aisle, with a chapel opening from it. Many of the brasses and monuments were saved and placed in the south-west corner of the new church, which is built in the Early English style, and has a red-tiled roof above the white stonework, which at once attracts attention. It is large, has a chancel, nave, south aisle and a north aisle as wide as the nave, which gives the inside of the church an odd appearance.

* Read at a meeting of the Upper Norwood Athenæum by Mr. W. H. Truslove.

At the west end is a square embattled tower. In 1893, when the church was restored, the organ chamber was added. The pulpit is both beautiful and imposing. It is composed of alabaster and various marbles, and was given in 1897 by Edward W. and Jessie Martin, in memory of their son and daughter. The font, believed to be Tudor, came from the old church, as also did the Communion table. The chancel is divided from the nave by a dark oak screen, also a relic from the old sanctuary, which Mr. Wm. Henderson, the present people's warden, informs me is fifteenth-century work, and this, I find, is borne out by Mr. Aymer Vallance, M.A., F.S.A., who says:—

"In the chancel screen of the church (Ewell) are some remains of oak screen-work, apparently of the first half of the fifteenth century. It is, however, impossible to determine the correct dimensions of the original screen, yet enough has been preserved to prove that it was rectangular in formation, consisting of compartments centred at 2 feet 4 inches, and sub-divided by moulded minor muntins into two lights each. The principal muntins are faced with buttresses, square on plan, and crowned with crocketed pinnacles running up the lowest bead of the lintel. The fenestration head-traceries average 10 inches high by 11 inches wide. Of these traceries the existing screen, gates included, comprises altogether fourteen, which cannot well be in accordance with the original plan, because they work out at an uneven number, making incomplete compartments on each side of the gates. Presumably, therefore, there are either two lights wanting or two too many. A large portion of the middle rail is original, but the battlements and moulding attached to its westward face are of modern introduction. The paltry open panelling below the middle rail is not only quite modern, but there can be no disputing that it utterly misrepresents the ancient design. Of the lintel (17 feet 8 inches long) both ends are spliced with additional wood, but the greater part—about 13 feet 6 inches in the middle—is genuine. Along the top is fixed a Tudor flower cresting, of which only the northernmost 6 feet length appears to be entirely modern, though the rest has all been much patched and restored."

Six monuments are fixed in the south wall of the chancel, the most imposing being to the memory of Sir William Lewen, who was Lord Mayor of London in 1717, and who died in 1721. He appears in his robes of office, and wears a wig. Among the brasses, a striking one is to Lady Jane Iwarby, 1519. She is wearing a heraldic mantle, adorned with a pedimental head-dress, and she is kneeling. This, and one in Lambeth, are said by T. R. Fairbank, M.D., F.S.A., in his "Memorial Brasses in the County of Surrey," to be the only instances of heraldic mantles now remaining in this country. Close by also will be found the figure of a lady wearing the "Paris" head-dress. Among other monuments and tablets from the former church are memorials of the Glyns, Bulkeleys, Reids, Calverleys, Dowdeswells, and Monros.

The register dates from 1604, and contains, among others, the following curious entry:—"Matthew Montague, of Cobham, and Agatha Turner, of Leatherhead. Their agreement of marriage was three market days published in the market of Ewell, and they were married by Justis March, of Darkin, the 3rd of May, 1654." The vicarage house was built in 1883, and the church-room was given by the Rev. John Thornton, M.A., vicar, in 1890-91. The present vicar is the Rev. J. Wallace, M.A., who has only recently been appointed to the living, which is in the gift of Sir Gervase Powell Glynn, Bart.

EWELL CASTLE.

Ewell Castle is a castellated house erected in 1804, in the Early Victorian and Gothic style. There are embattled parapets and octagonal turrets, the walls being stuccoed. It is now the residence of Captain Clarence Wiener. The grounds adjoin Nonsuch Park, and contain the foundations of the Banqueting Hall of Nonsuch Palace, the positions of the corner stones being clearly visible. It is stated some cellars were dug out, but have since been filled in again. The grounds were laid out and the lake constructed and stocked with trout by the present owner at considerable expense.

EWELL POTTERY.

A valuable earth or clay was some time ago dug from a large pit close to the grounds of Ewell Castle, and this, on being baked, formed the tile-bricks afterwards referred to. Pieces of Samian ware, also complete vases of a grey ware, have been discovered in the vicinity; these are now

in the British Museum. These vases were probably placed round the large jar containing the bones of some prominent Roman citizen or soldier. The quantity of bones and pottery discovered would suggest the existence of a burial ground hereabouts, possibly near a Roman village.

NONSUCH PALACE.

The erection of Nonsuch Palace was commenced by Henry VIII. in 1538, and, as its name implies, at that date there was None Such Palace in existence. Indeed, as a Palace of Beauty, Nonsuch was intended by Henry to be incomparable—and a palace the like of which no English king had ever attempted to build. The locality was some twelve miles south-west of London, adjacent to Cheam on the east and south, Ewell on the west, and Malden on the north. The name of the locality of the park and the site of the palace was Codrington, or Cuddington, a manor which also had its own church, and formed a distinct parish, of which the rectory was appropriated to the abbey of Merton. There are now, however, no evidences of either village or church, these having been cleared to make room for the palace and its grounds. It would appear that Henry VIII. acquired the grounds from Richard de Codrington, the last of a family that had long resided on the estate, and who, as we have seen, bore the local name. The lands the King acquired at that date (1538) were formed into two parks: the Great Park (now Worcester Park) consisted of 911 acres; and the Little Park, in which Nonsuch Palace was erected, comprised 671 acres. Both were afterwards included in the Honour of Hampton Court. Henry, however, did not live to see the completion of the palace, and King Edward VI. (who does not appear to have proceeded with the building of Nonsuch) in the first year of his reign (1547) granted to Sir Thomas Cawarden a lease for twenty-one years of Nonsuch, together with some 158 acres of land, for which he received a rent of £5 5s. 8d. and all the timber and large wood. Sir Thomas was steward of the Royal manor. Among the documents which Mr. Kempe printed is a Royal Warrant issued in 1557 for two bucks for the "Maioir and his Bretheren of our Citie of Londone from our Greate Parke of Nonsuch." Shortly after this, in the same year, Nonsuch was alienated from the Crown, Queen Mary having sold it to the Earl of Arundel, who finished the building of the palace, and held it for some years. After that nobleman's death it reverted to his son-in-law, Lord Lumley. It is on record that during the time the Earl had possession of Nonsuch he entertained Queen Elizabeth on several occasions, once for a period of five days. The Earl died in 1579, after which Lord Lumley took up his residence there. Queen Elizabeth was, however, so charmed with the palace that she negotiated with the owner for its purchase, and in 1591 Lord Lumley received lands to the value of £534, and Nonsuch again became a Royal Palace. A steel engraving of the palace—as it appeared in 1582, which I have seen in the *Gentleman's Magazine* for 1837, which in all probability was made from Houfnagel's picture of Nonsuch Palace—appears, after reduction, in the "Homeland Handbook" of the district. It shows a large quadrangle, with stately towers at the corners, and cupolas (which probably were gilt) with bannerets and a vast number of tiny windows. Along the front of the building were lofty Tudor windows with bas-reliefs between them. In the park in the foreground a lady, said to be Queen Elizabeth, is seen riding in a chariot drawn by smartly caparisoned horses; a hound is bounding at the side, and the lady is guarded by halberdiers both on horseback and on foot; while behind a huntsman is being dragged along by two dogs in leash. In the distance, and on the higher ground beyond the palace, hounds and men are hunting a noble stag, which in the picture looks as if it were an aerial chase round the centre cupola.

On Sept. 8, 1599, Mr. Rowland White wrote to Sir Robert Sydney that "Her Majestie is returned again to Nonesuch, which of all other places she likes best." It was to Nonsuch that Lord Essex addressed letters to Queen Elizabeth signed SX., and at the latter end of that September when the disgrace of her favourite Essex took place at Nonsuch.

Queen Elizabeth was again at Nonsuch in 1600, where she spent some time in hunting; and it is said that on a later occasion when returning from the chase the reflection of the setting sun on the palace caused her to think it was on fire, which scared her Majesty so much that she rode away in terror, and never again visited Nonsuch.

The only record of James I. being at Nonsuch is in 1624; but that King Charles I. was there on several occasions is shown by the list of his knights, honours being conferred upon

them at Nonsuch in 1625, 1629, 1630, and 1632. Pepys, in 1663, referred to Nonsuch, and called it "a very noble house, with a delicate park about it."

The palace was untouched during the Parliamentary wars, and it is said to have been a refuge for Charles II.'s Exchequer during the time of the Fire of London in 1666. The Merry Monarch, however, sold it to Barbara, Duchess of Cleveland, who was also created "Baroness of Nonesuch" and Countess of Southampton. It was in order to meet the demands of this woman (the King's favourite mistress) that the palace was given over to the destroyer, the park being divided into farms.

Aubrey states that Lord Rosebery's famous house at Epsom—The Durdans—was built out of the materials of Nonsuch, which included the staircase of the palace. (This, the first "Durdans," was burnt down, and with it the staircase.) In the hall of Stone Court (otherwise Gaynsford Place) at Carshalton, pulled down about 1800, there was an ancient chimneypiece, also said to have been brought from Nonsuch. Part of the palace, however, was standing in James II.'s time, but the estate was alienated by the Duke

revenues, with the result that Cheam was separated, and became known as West and East Cheam. These were two distinct manors—the former being appropriated by the Prior, and the latter by the Archbishop of Canterbury. During the reign of Henry VIII. both manors were "confiscated to the Crown," and that monarch granted a lease of West Cheam at the rent of £5 yearly to Ralph Goldsmith. Queen Elizabeth in 1585 granted its reversion to John, Lord Lumley. The pedigrees of the Lumleys are said to be among the oldest in the kingdom, and at Lumley Castle in Durham a collection of sixteen oil paintings of the earliest members of that noble house is, I understand, to be seen.

The Lumleys, too, appear to have been a literary as well as a noble family, for Lady Joan, the first wife of John, Lord Lumley, translated several speeches of Isocrates and the "Iphigenia" of Euripides; and James I. is reported to have purchased their celebrated library. East or Lower Cheam Manor House was about half a mile to the east of Cheam, and was held on lease from the Crown by the Fromond family. Lower Cheam Park now forms part of the site. In 1729 both manors came into the hands of the Duke of Bed-

NONSUCH PALACE.—From an Old Print.

of Cleveland and Southampton in 1730, when very little of this once magnificent structure remained.

But if the palace has been almost entirely obliterated, the park, with its magnificent avenue of trees, remains, and through the kindness of Colonel the Honourable Francis Colborne we have to-day seen at its best this once Royal estate, with the trees in full leafy attire, and the fields radiant and bright ere the hot summer sun has scorched and browned them.

CHEAM.

Cheam, a village of about 1,900 acres, is in the rural deanery of Beddington. In Manning and Bray's "History of Surrey" it is stated that in 1018 "Cheyham" (Cheam) was given by King Athelstan to Christ Church, Canterbury; but Brayley, in his History, says this must be a mistake, as King Athelstan died in A.D. 940. Extracts from a Chronicle of Gervase of Canterbury, which are published in Dugdale's "Monasticon," however, state that in 1018 Mestcham (no doubt Mitcham of to-day) and Cheyham, two "vills," were given by Ethelstan to the monastery of Christ Church. Probably he was a younger son of Ethelred II., and a brother of Edmund Ironside. Domesday, too, mentions that "the Archbishop of Canterbury holds Ceiham for finding provisions for the monks." According to Somner, the Archbishops held the estates of the church until near the close of the eleventh century, when Archbishop Lanfranc divided the

ford, but about the middle of the eighteenth century the Duke sold the manors of both East and West Cheam to the Mr. Edward Northey previously referred to.

CHEAM CHURCH.

Cheam Church is dedicated to St. Dunstan. The old church was built before 1449, of Kentish rag, and in the Early English style. It was demolished in 1864, and the erection of the present church was then commenced. In the tower are a clock and six bells. The sacred edifice contains a nave, north and south aisles, with apsidal chancel. The tower and spire, at the north-west corner, were added in 1870. The walls are faced with red and black brick—giving a somewhat unusual appearance—relieved with white stone, of which the exterior consists. The pillars, of Purbeck marble, are circular and plain; the capitals, however, are more ornate, but the workmanship is somewhat crude. This remark also applies to most of the stained glass windows. The stone font is supported upon short pillars of greenish marble. The rector, the Rev. Henry A. Wansbrough, M.A., of St. John's College, Oxford, was appointed in 1904, the living being in the gift of that College. The register dates from 1538. It is recorded that between 1581 and 1662 no less than five of the six rectors of Cheam became Bishops, one of whom, Lancelot Andrews, was first Bishop of Chichester, and afterwards appointed to the see of Winchester.

LUMLEY CHAPEL.

Detached from the church is the Lumley Chapel, which was taken from the chancel of the old church. It is now kept locked. It contains a monument to Joan (Fitz Alan) Lady Lumley, who died in 1577; a mural monument to her husband, John, Lord Lumley, who passed away in 1600; and also one to Elizabeth, his second wife, with a recumbent effigy. The most notable brass in this beautiful chapel is to Thomas Fromond (1542), Elizabeth (Yerde) his wife, and ten children. The whole of this brass is palimpsest, made up of various fragments. The obverse represents the man, in civil dress, and his wife, kneeling at desks facing each other; behind the former are their six sons, and behind the latter their four daughters, all kneeling. Between the parents is a shield of arms, and below the group an inscription; while above all the Holy Trinity is represented. These fragments, with one exception, date between 1500 and 1520, and are now hung in a wooden frame. Another brass, and most of it in a good state of preservation, is that of a civilian, date 1360. This effigy, the dimension of which is over 4 feet, however, has 8½ inches missing from the middle,

BRASS OF CIVILIAN IN THE LUMLEY CHAPEL, CHEAM.
DATE 1360 A.D.

and the inscription has also gone. The man is attired in a rather loose tunic reaching below the knees. He is girded round the hips with a baldric, which has an ornamental termination. Suspended from the centre of this is a short sword. The sleeves are quite tight and short, not reaching to the wrists, but beneath are short closely-buttoned mittens. Round the throat is a small hood fastened by buttons. The shoes are slightly pointed, and have a strap over the instep. The face, very good, is that of an elderly man with a short bifid beard. Another brass, a demifigure of a civilian of about the same date, bears a striking resemblance to the one just mentioned. This was discovered during the demolition of the church. Another brass of a civilian found at the same time is, however, of a later date (1459), but the inscription is lacking. There are also two brasses, one of John Crompton (1450), and the other to Johanna his wife (1458), the latter wearing a head-dress flattened heart-shape. She has a square face. There is also a brass effigy, only

6½ in. high, of John Yerde, c. 1480, in armour, and two shields, one of which, with Courtenay impaling Yerde, is palimpsest. The third brass is an inscription to Bartholomew Fromond, 1579, with two shields, also palimpsest; and in addition several other tombs of minor importance. The ceiling of this chapel is richly ornamented.

A REMARKABLE BUILDING.

At Cheam the eastern entrance to Nonsuch Park is noticeable. Near the gates is a drinking fountain, erected in 1895, by G. and M. Farmer. A stone cross is placed over the fountain. In walking from the church to the park, on the right, is a somewhat remarkable building, with a low, half-timbered gable end overhanging the pavement.

WHITEHALL.

We pass, too, Whitehall, also known as Maids of Honour House, a timber structure, dating from the time of Henry VIII., in which Queen Elizabeth, when a visitor to Nonsuch Palace, held her Council. Miss Killick, who resides there, was kind enough to allow us to inspect this "Council House." The following is a short description of Whitehall, supplied by Miss Killick: "The house consists of two storeys with rooms in the roof. The whole of the house is timber framed, the ground floor being brick-nogged, and the upper floor having the interspaces filled in with plaster work. The whole of the front (east), side (south), and back (west), except the drawing-room wing, is weather-boarded. The drawing-room wing and north side are rough-cast. An extra thickening of 4½ inches of brickwork has been put outside the ground floor on the west, and portions of the north and south sides of drawing-room wing. The roof is covered with tiles, and the roof timbers are of oak, the ties being curved and resting on a central stiffening beam in ceiling of attics. The windows on north side have been stopped up. The staircase has a fine central wood newel and winding stairs. The floor timbers are of oak, the joists being tenoned into a beam in the centre of the ceiling of the rooms. The lintel of entrance from staircase to passage to room over porch, on first floor, shows signs where tenons of vertical pieces have been mortised into it and pinned, and the posts next staircase at side of passage to room over drawing-room show where a horizontal piece has been tenoned in to the posts, and pinned. In the dining-room are the remains of an inglenook and an oven that opened out of it. The windows in the front of the building and the staircase have the original iron casements, the frames and fittings, and lead glazing. The two angle posts to the front in first floor have angle brackets on the solid inside. The brackets on angle posts on outside on ground floor are not on the solid. Several of the original ledged doors exist with wide vertical planks, the end planks with edges moulded, the middle plank raised."

Near by is a vault cut out of the sandstone rock, 27 feet long, 14 feet broad, and 11 feet high, having a descent of twenty-three steps; at the end of this, another flight of steps leads to a smaller vault. It may have been used as a larder for venison when Nonsuch Park was a Royal pleasure. The tradition is that the persecuted Protestants met here in the days of Queen Mary to read the Bible, and that later, when the place was in the possession of the Petre family, it was used as a hiding-place for equally persecuted Roman Catholic priests, when they said Mass during the prevalence of the penal laws. The story so common elsewhere is current here also—that the steps formed the entrance to an underground passage leading to Nonsuch.

THE RECTORY.

The Rectory is a fine old brick house. Until only a few years ago, when it was obliterated, there was an inscription on the outside of the dining-room chimney referring to a Rector of Cheam who was chaplain to Queen Elizabeth and afterwards Bishop of Chichester, no doubt one of the six rectors previously referred to. Some of the walls are covered with tile bricks from the old Ewell pottery, and have probably fulfilled their useful purpose for over three hundred years. Cheam House, built of red brick, has a Classic front.

CHEAM SCHOOL.

Cheam School is probably the oldest private school in England. It first assumed importance about the time of the Great Plague (1665), when several London citizens sent their children to Cheam to be educated by a gentleman who kept a school at "Whitehall House." The present school was built about 1719 by the Rev. Dr. Sanxay, who was succeeded by his son, and who, on becoming Rector of Sutton, resigned it to the Rev. William Gilpin, who has been immortalised as "Dr. Syntax."

DONCASTER MUNICIPAL HIGH SCHOOL FOR GIRLS.

In concluding this rather lengthy paper, which you have so patiently listened to, I must mention that it has been compiled from researches in "Manning and Bray's Surrey," "Greater London," Vol. II., *The Gentleman's Magazine* (1837), the "Homeland Handbooks," and "Highways and Byways of Surrey." I would also acknowledge assistance from Mr. Harradence in suggesting and prospecting last September this ramble with me and an old friend and member, Mr. J. Stanley (now blind); I also thank Mr. T. C. Thatcher, who supplied me with some notes on the screen in St. Mary's Church, Ewell, and the brasses at Cheam; and Mr. Wm. Henderson for the time he has devoted in showing us over St. Mary's Church and the Tower. In addition I must not overlook the kindness of Miss Killick in permitting us to view Whitehall; of the Rev. Henry A. Wansbrough, M.A., for opening to us St. Dunstan's Church and conducting us through the Lumley Chapel at Cheam; of Colonel the Honourable Francis Colborne for permission to drive through the famous avenue in Nonsuch Park, and see the ruins of the Palace in his grounds; and that of Captain Clarence Wiener for permitting us to see the remains of the foundations of the Palace Banqueting Hall on his delightful estate, and for entertaining us with afternoon tea.

WITH some artists it is always possible to express the universal affirmative: X is always X; Reynolds, Murillo, de Hooch, Boucher (to take examples from different schools) were always to be known by their works. But as much cannot be said for most artists, and particularly at the present day. For the purpose of the present notice, let it be clearly understood that Mr. Clausen, even if apparently exhibiting on various canvases a disregard for his reputation, does

In "The Little Alehouse" we are confronted by a picture, thoroughly Dutch in feeling, with its group of drinkers round the rustic table; and the light from within flooding forwards and bathing the group in a generous splash is particularly effective. A typical Clausen is "A Little Fair Child," and worked in a bright scheme of colour. Contrast with this a water-colour sketch, "Storm Clearing Off"—very dauby indeed, and were it not by a well-known artist it would certainly not obtain the suffrage of the British sheep. This, too, may be predicated of "Looking towards the Hills," whilst "The Tate Gallery," though produced in a nice scheme of colouring, presents us with an almost unrecognisable Tate Gallery.

Speaking generally, Mr. Clausen's oil paintings, as here shown, are preferable to the water-colours, but there are exceptions. "Riverside—Winter Afternoon," with its mists, is very poetic, and this term may be employed also respecting "London Roofs" and "Lambeth Bridge," where, given uninteresting and unpromising subjects, Mr. Clausen has turned them into poems.

And now for the unfortunate contrast; "London-Night," "Sunset across the River," and "Evening Sunlight" are adjectivally indescribable, when we remember from whose brush they issue. To depict the moon as though it were a damaged electrolier is unforgivable. J. M. Turner, as we know, went a bit crazy over solidifying the heavenly lights, and the Impressionist School is rampantly lunatic in that and other ways, but artists of modern repute will be well advised to keep in the accepted track. "The Cottage Garden" is in Mr. Clausen's best style, and this is high praise; here the plastered cottage exterior, the trees, shrubbery, and bright patch of flowers and the human interest, provided in the working-man, all combine in the production of a fine work.

If, before dealing with others, we list those works which we regard as the exquisites of the exhibition, to "The Little

DONCASTER MUNICIPAL HIGH SCHOOL FOR GIRLS.

Alehouse," "Riverside," and "London Roofs" already noticed, we should add "Souvenir of Nauplia," where a curiously effective result is produced by the dark massing of tones in the foreground, with a lightness and brightness beyond, seen through the inframing trees. And we must also include in the list "The Old Gateway," where the young mother, holding her little one in her arms and standing in the open doorway, is bathed in the light from without, which just glances inwards on the threshold.

In "An Old Woman" we are presented with a study of a rugged but not coarsely painted face. "St. Paul's in Fog" is a good water-colour, the unwelcome visitant being well put in. "A Quiet Room" is very attractive, the young girl on the sofa and the brilliant prospect seen through the closed window uniting in a satisfactory ensemble. Mr. Clausen's flower pieces, too, are invariably good.

"Rejoicing after the Rain" is brilliantly clever, the artist having sympathetically caught the effect of the sun's rays darting through the still damp-laden atmosphere. "Winzes Farm" is another good work, and so also is "Cottage in the Trees." A couple of bust studies, "Dorothy" and "Study in Grey," are quite Clausenesque. We had an interesting and animated discussion with our fair companion as to the original of the sketches being one person or separate entities; personally we incline to the belief that one piquant model sat for the two studies.

Very certainly the good work in this exhibition preponderates satisfactorily over the less good and the poor.

ILLUSTRATIONS.

COMPETITION DESIGN FOR THE SEALE-HAYNE COLLEGE, NEWTON ABBOT, DEVON.

This design was submitted by Messrs. Moscrop-Young & Glanfield in an open competition held recently. The drawing shows the main front overlooking the valley. The central

building was the office and rooms of the principal and caretaker, while to the left was the library and to the right the museum. These latter were connected to the students' quarters and administration department by a semi-circular open corridor, as shown on the drawing. The materials suggested were red brick with stone dressings, wood cornice painted white, roofs covered with tiles or green slates, and sash windows.

DONCASTER HIGH SCHOOL FOR GIRLS.

This building occupies a position having easy access from all parts of the town of Doncaster, and is surrounded by open spaces and adjoins the grounds of the Municipal Museum and picture gallery. The accommodation provided is for 300 pupils. Owing to the unequal levels, parts of the building are three storeys in height, but none of the rooms are below the adjoining finished ground levels. The drawings show the general arrangement of the several rooms.

The design was submitted and selected in a limited competition, the assessor being Mr. E. R. Robson. The buildings are faced with red pressed brick and "Marmo," the latter made by the Leeds Fireclay Co., Ltd., the roofs being covered with red Staffordshire tiles.

The architects are Messrs. J. M. Bottomley, Son & Wellburn, of Leeds and Middlesbrough, the contractor Mr. J. T. Wright, of Leeds, and the clerk of works Mr. C. J. Weighell, of Doncaster.

INTERIOR DECORATION.

The illustrations we reproduce have been described by Mr. A. E. Bullock in his series of articles on "Interior Decoration."

MR HAROLD DICKINSON, A.M.Inst.C.E., &c., of Leeds, has been appointed electrical engineer by the Liverpool Tramways Committee at a commencing salary of £1,000 a year. There were sixty-five candidates.

By ALBERT E. BULLOCK, A.R.I.B.A.

GREAT BRITAIN.—III.

HOUSE OF HANOVER—THE GEORGIAN ERA.

(Continued from page 218.)

MOOR PARK, Hertfordshire, presents throughout a scholarly application of Classic detail. Leoni had been architect to the Elector Palatine, and was thoroughly skilled in his profession when he came to England. The decorations of Moor Park were chiefly entrusted to Sir James Thornhill, who probably directed the work of Sleker and Amiconi. Thornhill brought an action for his fees against Leoni's client, Benjamin Heskin Styles, who seems to have been difficult to please. Thornhill sometimes adopted a method of charging for his paintings by the yard on the basis of £3 for ceilings and £1 or £1 10s. for walls. His arrangement with Styles was probably by contract.

The hall is a particularly fine apartment, upon which the artists have concentrated their chief energy. From floor to ceiling-dome the scheme is complete. The pedimented door casings surmounted with figures are executed in marble, of which material the dado is also composed; the walls are treated with modelled plaster in panels, the pictures, forming part of the decorative theme, having a boldly moulded frame crowned with amorini holding festoons. A gallery runs round the four sides of the hall, the walls of which are painted with figures in niches. The ceiling is painted with a central coffered cove forming a circle, with a cupola in the centre panel treated in perspective. The plaster work to the surrounding soffit is somewhat floriated, the figure work, however, being well executed and in keeping with the remainder. The saloon is entirely painted above the panelled dado, as is also the staircase, both walls, and ceiling. The staircase paintings were executed by Sleker in 1732.

Sir Laurence Dundas employed Cipriani, the fellow-pupil and friend of Bartolozzi, the engraver, on the decorations to the dining-room about 1765, doubtless under the direction of Robert Adam, who carried out several additions to the gardens at this time, notably the fine gate-piers and the tea-house in the grounds, together with the furniture for the dining-room.

Stoneleigh Abbey, Warwickshire, was commenced in 1720—or the same year as Moor Park—by a local architect of the name of Smith (probably William Smith, who assisted James Gibbs upon the Radcliffe Library, Oxford). Externally it has a palatial aspect, having a basement and three upper storeys, treated in the same plane, the whole being crowned by a bold cornice and balustrading. Its loftiness gives it a gaunt air and the appearance of being overwindowed. This portion of the abbey, Mr. Tipping tells us, was built by Edward, the fifth Lord Leigh, replacing a great deal of the old mansion of the seventeenth century, portions of the original Cistercian monastery of the time of Henry II. being still intact.

The entrance hall retains its old Jacobean panelling and late Tudor type of ribbed vaulting to the ceiling, but the note changes immediately one enters the saloon, where the Classic detail is manifest. Here the plasterer is supreme, the pictures and plaques having a gesso treatment. A pair of unicorns in high relief figure repeatedly in the frieze of ornament below the heavy ceiling cornice. There are no wall or ceiling paintings in the scheme, the large central panel of the ceiling containing a finely modelled Classic subject, in which Neptune and Cupid appear with other figures in the clouds. The execution is sympathetic and delicate, the soft shadows and gentle contour of the human forms, with here and there a contrasting sharpness, as the protruding bow of Cupid, the trident of Neptune, or the modelling of some flowers, being very effective.

The room known as "The Velvet Drawing-room" is wainscotted in oak, with an order of fluted Corinthian pilasters of considerable projection from the wall, thus giving a recessed appearance to the intervening spaces. The fittings in these two rooms are a little inappropriately hung; the glass chandelier would be more suitable in the saloon, while the metal candelabra here would befit the panelled treatment of the drawing-room to much greater advantage.

Several inlaid staircases erected about this time indicate a high standard of skill on the part of the joiners. The practice of forming replicas of French interiors brought foreign artisans to this country, many of whom probably obtained employment in cabinet and marquetry work with Chippendale and Carwithan. Burford Priory, the residence of William Lenthall, Speaker of the House of Com-

mons (temp. Charles I.), contains a fine inlaid staircase, while others exist at No. 54 Great Marlborough Street, London, W., the Hall, Glastonbury (1726), and at Claydon House, Buckinghamshire. J. Carwithan's book, containing "Various Kinds of Floor Decoration," appeared in 1738.

Barnsley Park, Gloucestershire, is the type of house erected by Hawksmoor, having Corinthian pilasters attached to the window-piers, as at Easton Neston. The hall has an open screen leading to the staircase in the manner that formerly existed at Easton Neston. The vaulted coving to the hall ceiling, the iron handrailing to the stairs, and the treatment of the ceiling panel over the staircase are strong points in favour of Hawksmoor's authorship. The building was apparently erected for Brereton Bouchier, who died in 1719, being subsequently inhabited by Henry Perrot, who married Bouchier's daughter. The rainwater heads bear the date 1721.

The dining-room was decorated during the occupation of the house by James Musgrave (son of Sir William Musgrave, rector of Chinnor, Oxfordshire), in the Adam style, the interior grate to the chimney-piece in the oak room being one of the Adam additions after 1778.

Ditchley House, Oxfordshire, brings us in touch with the style of James Gibbs, the architect of the Radcliffe Library, Oxford, who was born in 1674. He was of Scottish descent, and the author of a work on architecture containing "Designs of Buildings and Ornament," which appeared in 1728. Gibbs's attempt to institute a style which he had reduced to a system was doubtless the outcome of the publication of Palladio's "Principles," previously referred to, and his example was followed by subsequent architects. The work certainly added very materially to the library of current architecture, which was not extensive at this time. The character of his details is sensible, being free from mannerisms, based on sound construction and design. Ditchley is a good example of his work, and presents externally a quiet and dignified treatment. There is no order; the entrance door and coigns are rusticated, and the windows have architraves with keystones to the heads. An element of truthful construction pervades Gibbs' work, which, if at times a little too academic, is at least freer than the work of some of his compeers, and superior to the examples of those who were guilty of putting ornament in unnecessary spaces for its own sake. Gibbs saw the value of confining his decorative features to their proper localities, and although such a method tends to isolation of parts, which is, perhaps, one of his greatest faults, Gibbs managed to create a theme by means of repeating features on either side of a common centre with true architectonic propriety.

The interior of the hall at Ditchley has certain features akin to Leoni's treatment of the hall at Moor Park, with this difference—namely, that Gibbs differentiated between the relative importance of certain doorways, carrying the eye to the centre of each wall by increasing the projection of the decorative feature employed, whether it be a niche with statue or a doorway leading into a saloon, by supporting the entablature upon an order and crowning the pediment with sculptured figures. There is little painting in the interior of Ditchley, the architect relying upon the effect of panels and plaques sculptured in semi-relief. A pupil of Scheemaker's, Sir William Cheere, executed some of the chimney-pieces, notably that in the Green Drawing-room, while the hand of Kent is obvious in the design of the overmantels. Kent is also credited with the design of the benches in the hall and three of the paintings there. The chimney-piece here is the work of Stanton and Horsenaille, doubtless from Kent's designs; the overmantel containing the portrait of the second Lord Litchfield is by Aikman. The plaster work of the saloon is of Italian workmanship by Serena and Vassali. The panelling above the dado in the Green Drawing-room savours rather of French design as practised during the early years of Louis XV. Portraits by Sir Peter Lely (died 1680) and Sir Godfrey Kneller (died 1723) are incorporated in the decorative scheme of the White Drawing-room, where Kent's characteristic features are again evident. The ceiling having fallen in 1749, was subsequently reinstated in the prevailing style.

William Kent was born in 1684, and is described in the "National Dictionary of Biography" as a "Painter, Sculptor, Architect, and Landscape Gardener." About 1714 he went to Rome with the son of William Talman, who was the first director of the Society of Antiquaries. John Talman returned to England the following year with Giuseppe Grisoni, and died in 1726. In 1727 Kent published in two volumes "The Designs of Inigo Jones," at the expense of the Earl of Burlington, which was illustrated by

drawings made by Henry Flitcroft and others. Kent's chief decorative work is Houghton, the seat of Sir Robert Walpole; he also executed a staircase at Raynham Hall, Norfolk, for Lord Townshend; altered and decorated Kensington Palace; built the Horse Guards, Whitehall, and Devonshire House, Piccadilly. Of his three journeys to Rome, the last was accomplished in 1730. Kent appears to have been the most versatile of our eighteenth-century artists. He has been called the father of modern gardening, Euston, for the Earl of Grafton, forming one of his principal works in this respect.

William Kent succeeded Wren in the enlargement and decoration of Kensington Palace about 1720. His work here secured the approval of both George I. and George II. He was subsequently appointed "Master Carpenter, Architect, Keeper of the Pictures, and Principal Painter to the Crown, the whole including a pension of £100 a year, which was given him for his works at Kensington, producing (according to Walpole) £600 a year," which is the statement given by Mr. Ernest Law. The chief rooms decorated by Kent include the King's Staircase, the Presence Chamber,

Queen Caroline's Drawing-room, the Cupola room, the King's Drawing-room, the Nursery, and the King's Privy Chamber, the two last mentioned being redecorated in subsequent years.

The King's Staircase had originally been painted by Streater under Wren's instructions. Kent made drastic alterations, even to the windows. The black marble treads and risers and the wrought-iron balustrading, said to be by Jean Tijou, were restored, and are now the only remains of Wren's work. The walls are painted with an order of Ionic columns, the panels between containing arches with figures grouped above the balustrades. The ceiling consists of a large central square painted with a geometrical design in the panel, and having ornamental panels upon the surround. The Presence Chamber contains the original Gibbons chimney-piece, while the windows, doors and ceiling are Kent's work. This latter is quite different to any other work in the Palace by this artist being based upon Raphael's designs in the Vatican. The colours are bright reds and blues on a white ground with certain features gilt. It was painted in 1724, and in design is of the Pompeian character adopted by Giulio Romano and his school.

The ceiling of Queen Caroline's Drawing-room and the King's Drawing-room are of similar composition, having a cove decorated in the French manner and large oval centre for painting. The walls have a low panelled dado, and were lined with old velvet flock paper, which was introduced about this time. The present paper is newer, and is said to be a copy of the old pattern. The Cupola or Cube-room, which connects the two rooms last mentioned, is treated with marble porches to the doors and painted pilasters to the walls leading up to a coffered coved ceiling. The room is 37 feet square, 26 feet to the top of the cornice and 34 feet 7 inches to the top of the cove. This room is exactly as it left Kent's hands, and is in the style he most favoured in work executed for his patron, the Earl of Burlington. Kent was associated with Bridgman in laying out the gardens on the east front of the Palace, including the basin or Round Pond, thereby destroying the fine Dutch gardens of the time of William and Mary. The present Old English sunk garden has superseded much of this work, and, with its lime walk, adds considerable interest, connecting, as it does, the Orangery with the Palace.

Sir Robert Walpole secured the best talent of his day in the building and decorating of his Norfolk mansion. He was one of the nineteen children of Sir Robert Walpole, the member for Castle Rising during the reign of William and Mary. The second Sir Robert, following politically in his father's footsteps, eventually rose to the position of Prime Minister. He had bought largely of South Sea stock, and sold at a good figure before the bursting of the bubble.

The building of Houghton was commenced by Walpole in 1722 from designs by Colin Campbell, the architect of Mere-worth, and author of "Vitruvius Britannicus." Thirteen years were taken to complete it under the directions of Thomas Ripley, the protégé of Walpole, whose brother Horatio employed him concurrently with the building of Wolterton Hall in the same county (1724-30). The former work called forth Pope's satire:

"Heaven visits with a taste the wealthy fool,
And needs no rod but Ripley with his rule."

Ripley was of Yorkshire origin, and, in common with Ware and Flitcroft, was of lowly birth. His advancement, however, was rapid. From clerk of works at the King's Mews, he built the Custom House (burnt 1814); was appointed chief carpenter in succession to Grinling Gibbons; carried out the works above mentioned; built the Admiralty, Whitehall (subsequently refaced by Robert Adam); succeeded Vanbrugh as Comptroller of the Board of Works; became Keeper of his Majesty's roads, gates and bridges; designed the interior and roof of the chapel of Greenwich Hospital (burnt 1779), and eventually inherited through his second wife a fortune of £40,000. In 1758 he died at Hampton Court.

(To be continued.)

REFRONTING BUCKINGHAM PALACE.

It has been a *versata quaestio* for a long period, and of recurrent interest during successive "silly seasons," alternating with such questions as "What shall we do with our boys?" "Ought girls to take off their hats in places of worship?" and the long list of queries whose discussion has so wearied the jaded journal-reader.

"What shall we do with Buckingham Palace?" Whether to be amended or ended, it has never been commended. When the late Queen Victoria ascended the throne the Palace wore a very different guise to its present discredited one. There was no eastern block facing the Mall and enclosing the quadrangle. The Palace, as it then stood, was mainly the work of John Nash, and the only pile blocking the Mall approach to the Palace was Nash's Marble Arch, now so inartistically isolated without regard to axis in Oxford Street.

But a grand improvement scheme was decided upon in those early years of Queen Victoria's married life, and this consisted in removing the Marble Arch and in enclosing the quadrangle, as we now see it. Whereas Nash had used Bath stone for the north, south and west façades, Edward Blore (whether on his own initiative or not we are ignorant) used Caen stone for the new block; and so unsuccessful has been the result that we (in common with the general public) have thought that we were confronted by undistinguished stucco, this effect being aided by the periodical painting to which the fast-decaying stone has been subjected.

Better days are now in store. The Caen stone is to disappear in favour of Portland stone, and an architectural design more in accord with Nash's is to replace Blore's. Sir

Aston Webb, C.B., has been commissioned to prepare the scheme for giving a new face to our old friend; the treatment will be in the Renaissance style, naturally, and, as indicated, will show flat Corinthian pilasters, providing at the same time for overcoming the present deplorable skyline by raising the façade sufficiently to mask the poor roof and chimney stacks.

Sir Aston's task has not, we should imagine, been one of the easiest, for he has had to retain in position and size all the windows and entrances as at present and to build up his design round them; this doubtless accounts for the somewhat insipid effect produced. With a free hand he could have coupled the columns at suitable intervals, but even as it is there is a sense of dignity and proportion, as well as fitness, such as we have learnt to expect in the work of Sir Aston Webb. The introduction of pediments is a great improvement, and the central entrance will certainly be more presentable than in its present garb. There is, in fact, a distinct levelling-up on the whole, but still we consider that Blore's separate treatment of the storeys is more in accord with the ethics of Design than the use of the Colossal Order.

Ornament will be used sparingly, and where used will be in the main heraldic. Sir Aston's idea is apparently to allow the Victoria Memorial to dominate the Palace, whereas we are of opinion that the latter should be the dominant factor.

Messrs. Leslie & Co. are to execute the work, which will be put in hand shortly. The stonework will be prepared in the stoneyard; the stones will be numbered, and everything is to be made ready for fixing before work *in situ* is commenced, so that when the Court has left the Palace during the ensuing year the architect and the builder will collaborate to produce a finished work by the autumn.

FRENCH RENAISSANCE ARCHITECTURE.—II.

THE second of the course of ten public lectures on "French Renaissance Architecture" now being delivered on Thursday evenings at University College, Gower Street, W.C., by Mr. W. H. Ward, M.A., A.R.I.B.A., was entitled "The Beginnings of the Renaissance in France: The Italian Craftsmen, Charles VIII. and Louis XII."

In his introductory lecture Mr. Ward had chiefly dealt with the rise and development of Renaissance in Italy.

A certain infiltration of humanistic ideas into France might be traced, he said, as far back as the early years of the fifteenth century, though it was not till near its close that imported specimens of Italian or Classical art began to exert any marked influence on the surrounding Gothic. No French building contains any trace of Renaissance influence externally before 1494; though the chapel of St. Lazarus in the old cathedral of Marseilles (1479-81) contains Renaissance internal decoration. In 1494 Charles VIII., with a large army, invaded Italy and established himself in the Kingdom of Naples. During their stay of some months the King and his French nobles became enthusiastic about Italian art, engaging Italian craftsmen and sending home portable objects. Twenty-two Italians accompanied Charles back to France in 1495, and were principally employed at the embellishment of his favourite residence, the castle of Amboise. During the following thirty or forty years artists of all sorts came from Italy and settled in the adjacent valley, where they established the School of Amboise or of the Loire.

The architect in a modern sense was a person foreign to French practice up to this time, though in Italy he had existed for a century or more. French critics used to hold that the Renaissance buildings of France owed their origin entirely, or almost entirely, to Frenchmen. Now, however, it is generally admitted that the Italians had a preponderant share in the movement during at least the first generation. For the first few years there would be little to distinguish the new type of building from the old, but for the activity of the Italian stone carvers in executing wall decoration. By some twenty years after the Italian campaign, French builders had begun to assimilate the new ideas, and there arose a crowd of buildings with Gothic bodies clothed in Renaissance garments. The Italians were mostly from Northern Italy, and brought with them the local exuberant type of design with much minute ornament.

The influence of the Renaissance on planning is visible in efforts towards regularity and symmetry. It is occasionally manifested also in an increase of horizontal emphasis and a reversion to the Roman system of combined

arch and lintel composition. But at first the effects are usually confined to less essential elements than the general design, consisting of the introduction of Italian ornament or of Italian features, or even only parts of features into compositions otherwise conceived on wholly Gothic lines. The Gothic elements are usually those which do the work, which form the carrying or enclosing members; while the Renaissance elements are the carried and enclosed members.

In addition to these stylistic changes there were others, such as were due to a great increase in the number and size of windows and galleries, especially on the outer faces of buildings, or to the introduction or revival of crafts and materials.

Mr. Ward then dealt somewhat minutely with the castle of Blois, and more especially with the wing erected by Louis XII. between 1498-1502. Another important building described was the great château of Gaillon, now only remaining in fragments. The Hôtel d'Abbaye at Blois is a well-preserved specimen of its class, chiefly dating from about 1512. The street front is almost entirely Gothic, but in the court almost every part except the dormers has Renaissance detail.

Towards the end of the reign of Louis XII., i.e. 1515, the fusion was a fairly complete one. In the new reign everything contributed to the persistence of the process of translation in which native detail and feature was expressed in the new language. The new king, Francis I., and his courtiers lost no opportunity of engaging Italian assistance in the embellishment of the innumerable residences then commenced. Side by side with its picturesqueness the greatest interest of the architecture of Francois Premier is in the beauty and refinement of its detail and in the ingenuity of its translations of various native features into the new form language imported from Italy.

Mr. Ward concluded his lecture by discussing a few of the principal examples of the styles.

INSTITUTION OF MUNICIPAL ENGINEERS.

THE annual general meeting of the above Society was held on October 11 and 12 in London. On the afternoon of the first day four papers were presented for discussion. The first, by Mr. F. W. Platt, dealt with "The Modernising of Building By-laws," and was reported in our issue of last week.

Mr. H. C. H. Shenton (Member) then presented his paper on "The Local Government Report on the Intercepting Trap."

The report of the Departmental Committee appointed by the President of the Local Government Board to inquire and report with regard to the use of the intercepting trap in house drains deserves the close attention of the municipal engineer, and may be usefully discussed. It is probable that as a result of the evidence brought forward the Local Government Board will alter their Model By-laws to the extent of permitting, or even of demanding, the omission of intercepting traps in house drains. It is not the author's object to review the report, but merely to start a discussion among members of the municipal engineering profession, who collectively must possess far more knowledge of the subject than any other body of men.

The sanitary expert and the engineer in private practice view the matter from a special standpoint. Their knowledge is to a great extent limited to the drainage of the better-class houses, and they have, as a rule, a very limited knowledge of the conditions which exist in the mass of houses of the working classes. Neither have they the drainage of whole towns and districts under their control. They are, therefore, more likely to be surprised at the conclusions of the report than those men who have for years made a daily study of the conditions which exist in the sewers and drains of a town taken as a whole.

The private engineer who is a sanitary expert may design systems of drains perfectly, and may see to it that these are absolutely well constructed, properly ventilated and flushed. Moreover, he will very likely be able to see that they are cleaned periodically, and that they are frequently inspected. He may take special steps to avoid the troubles which are mentioned in the report. He may regard the blocking of an intercepting trap on his system as a thing never likely to occur, and, moreover, he will, without doubt, take such steps as will prevent any possibility of nuisance or danger to health, even if the trap does get clogged.

It is also quite reasonable to imagine that the owner of property who has spent so much money on his drainage

system would object to allow the sewers, which are not as clean as his drains, to be ventilated through them, but such cases are the exception and not the rule. The sanitary expert is better acquainted with these cases than with the drainage system of ordinary houses, and arguments in favour of the intercepting trap, which are based on the existence of the perfect system, designed regardless of cost, have practically no bearing upon the present case.

A considerable section of the report is devoted to the demonstration of the fact that the importance of sewer ventilation, and even of drain ventilation, is not as great as is generally imagined. Apparently there is no reason to omit the intercepting trap for the better ventilation of sewers. We are told that "If, therefore, the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection."

It is, moreover, evident that if sewer gas is noxious, we do not want outlets close to our houses. If, on the other hand, the sewers do not require this ventilation, one great argument in favour of the abolition of the intercepting trap falls to the ground.

There also appears to be no doubt that the intercepting trap is effective, for one of the conclusions contains the statement that "it seems to be established that the trap does serve as an effectual barrier to the entry of sewer air into the house drain, which is the fundamental advantage claimed for it. It is not liable to be forced and rendered useless, as has been supposed to be the case, by pressure of air from the sewer."

There is, however, one great and absolute objection to the trap, and that is its liability to become stopped up. The evidence brought forward in the report that this is so is overwhelming, and herein lies the need for alteration in the general practice. It is unnecessary at a meeting of municipal engineers to dwell upon the dangers resulting from a stopped drain. It would, however, be interesting to receive fresh evidence from the members present as to the prevalence of the stoppage of traps.

There is one point with which the report deals somewhat too lightly in the author's opinion, and that is the value of the trap as a barrier against rats. The report tells us that Mr. Patten Barber gave evidence to the effect that he had seen rats chased into the inspection chamber of a drain, where they escaped into the sewer through the trap, and conversely that Mr. Woods, sanitary inspector of Willesden, saw three or four rats come up from a sewer through an intercepting trap.

The author has recently had experience in Kensington of rats coming up through holes in the ground on the sewer side of a house interceptor. The examination proved that the connection was an old brick barrel of a defective nature, through which the sewer rats came. Although it was evident that the rats came up close to the interceptor, it did not appear that they had entered the house drains. The connection has now been repaired, and it has been assumed that the trap will exclude the rats from the house drains. If rats come through traps, how is it that they are practically unknown in London houses except where the drains are untrapped? In the author's memory, in the days when intercepting traps were rare, there was another trap which was very much in evidence—viz., the domestic rat-trap, which was as common then in our homes as the domestic mouse-trap is now. To what is the change attributable?

Again, though the author has frequently seen rats in sewers, he has never, during twenty years' experience on and off of house drains, seen a rat on the house side of the interceptor, though in untrapped drains he has seen them.

The fact that rats have been known to pass through traps under certain conditions does not prove that the trap is, under ordinary circumstances, an ineffective barrier. For instance, cows have been known to jump over fences, cats to swim across water, fishes to pass over land, and so forth. It may be argued that the presence of rats in a tight drain, properly trapped at the gullies, is less objectionable than a blocked drain, but this presupposes that the trapped gullies are effective barriers. If the intercepting trap is not an effective barrier, neither is the gully nor water-closet trap, and there is therefore every reason to expect that where there are many rats in the sewer, they will come into the houses. We know from experience that this is not so. The inefficiency of the intercepting trap as a barrier against rats, as stated in this report, is therefore a point upon which further evidence is desirable.

Another question, and perhaps the most important of all,

is the manner in which to act when it is finally established that intercepting traps are to be done away with. The Model By-laws having been altered, and the local authority having decided to act upon them, what will then be the position? Houses situated in positions far apart will have to be drained. Are these houses alone to be new points at which the sewers are to be ventilated? It may well be that in a town where there are many houses without intercepting traps, the ample ventilation given prevents the likelihood of any nuisance due to the escape of an unduly large volume of sewer gas or smell at one point, but when, say, one house drain on a long length of sewer is to be made to ventilate that sewer, may there not be a considerable nuisance at that point? It is common experience that when a new system of sewers is put into operation, smells occur at unexpected points. Smell escapes and is noticeable at some open cover, and the inhabitants are not slow to complain. This is quite as likely to happen at an open cover near a vent shaft as elsewhere. Theoretical principles do not seem to prevent the inlet ventilator from acting as an outlet, or to prevent the bulk of the smell issuing at some point not intended instead of at several ventilators placed for its special accommodation. Is not the same thing very likely to occur if one or two house vent pipes are used for sewer ventilation at houses, and may not the municipal engineer have to deal with complaints imaginary or otherwise, from local residents who are alarmed? The author, having had considerable trouble from objections raised to purely imaginary smells from sewer vent shafts, cannot avoid the impression that there must be possibilities of trouble for the municipal engineer in the application of the new method.

Again, would it be possible to remove all the traps in the town? It would be easy to make them inoperative as traps by removing the cleaning eyes, but this would not do away with the chief danger—viz., that of stoppage. However, it would be desirable to remove all cleaning eyes as a start, rather than to make a few house drain vent pipes the only new sewer ventilators.

The chief point, therefore, which the author wishes to raise for discussion is how best to apply the teachings of the report.

Mr. Baldwin Latham, M.Inst.C.E., in opening the short discussion on Mr. Shenton's paper, confessed that he had not yet read very carefully through the Local Government report. In the course of his practice he had put in many thousands of intercepting traps and had never known one of them to stop up. The intercepting trap which has an abrupt fall into it could never, in his opinion, fail; there were at least three different makes of which this could be said. Rats were never found in a properly constructed drain. He would like to know if a rat could withstand a pail of hot water poured down the drain. The question of rats has arisen in brick sewers which have become broken. The sewer air has been shown to be purer and freer from bacteria than the air in a street. It sometimes happened that the rain-water pipes were connected with the house drains; in that case the air from the sewer would pass into the houses if there was no intercepting trap.

Mr. H. Percy Boulnois, M.Inst.C.E., said that he had been an advocate all his life for the use of the intercepting trap, consequently the Local Government report came upon him as somewhat of a bombshell when he found that after careful investigation the committee had come to the conclusion that the trap was not only useless but was practically dangerous. The indictment against the trap was that the fresh air inlet became a foul-air outlet and a positive danger to the inhabitants of the house. An answer to this is that if the inlet does smell it is acting as a detective, inasmuch as it shows there must be something wrong with the drain or trap. A graver indictment is that it chokes, and that the drain itself becomes choked, and that the inhabitants are not aware of it while the soil gets saturated. But one must remember that very careful experiments were carried out, which showed that the trap did accumulate a great deal of solid matter passing through the drain; but it also showed conclusively that all kinds of traps retained from 42 to 79 per cent. of solid matter. That might be so; but was it not possible that if there had been used a greater flush of water that would not have occurred? If the drain cannot remove the solid matter it is not surprising that the trap cannot. It was rather a large order for the Committee to suggest that the house drain should become a ventilator. The Committee are saying that the trap is useless. The question of rats was important because these animals had been accused of spreading disease. In each case in which the rat had passed through traps it had been actuated by fear

and did a courageous thing as a consequence. He (the speaker) felt certain that a trap on a drain would exclude rats under normal conditions. One of the most important parts of the enquiry was into the chemistry of the sewer air. The committee have declared that the air of a sewer is harmless, while the air of the drain might be exceedingly dangerous. The alleged reason for the alleged difference is in the splashes. But splashes were exceedingly difficult to avoid. If the trap is to be omitted he would like to know how they were to proceed in the future. The committee said very properly that iron drains should be substituted for stoneware drains. Undoubtedly if the whole drainage of a town was composed of iron pipes with proper seals, &c., then it was possible there would be no harm from the absence of intercepting traps. But if stoneware traps were employed he personally would rather have a trap between himself and the sewer.

Mr. E. A. Strickland, borough surveyor, Windsor, pointed out that another difficulty was that one could not be sure that all the houses were disconnected. There must in this matter be fair treatment all round.

Mr. A. J. Martin said that the law has taxed the householder and the rate-payer for a number of over-lapping precautions which not only have not been required but in some cases defeated the object in view. In laying down sewers one endeavoured to make them sound, to provide abundant flushing facilities, and also ventilators so as to keep the air pure. But after doing all this we put down an appliance apparently expressly designed to cause the air to stagnate. The arguments in favour of the trap advanced in the past have largely been based on the conditions which the trap itself has brought about. The trap is put in because the air is likely to be offensive; but the only stagnation is in that very trap. If all the traps were abolished there was no reason why the air should not be harmless. People seemed to imagine that by writing "outlet" and "inlet" on certain pipes they were quite safe. A good deal had been made of the argument that it was unfair to ask the householder to allow his drain to ventilate the public sewer. That seemed to him to be a very narrow view, for if it was not the householder's business whose business was it? There was no more hardship in calling on the householder to ventilate the public sewer than in taking his money to do so. The fact was lost sight of that the air must go somewhere; but it was a risky thing to have large volumes of foul air collected unless one knew exactly where they were going to. Was it not better for the foul air to leave the sewers by a number of different points than in small quantities by one or two? However, the country was too apt to swing from one extremity to another. If they did away with the trap in the new system they should not do so in the old ones.

THE AUTUMN EXHIBITION OF THE OLD DUDLEY ART SOCIETY.

IN renewing our art criticisms after a period of recuperation of tone and energy, our unjaded powers shall direct their earliest attention to the display of this well-known water-colour society in the equally well-known gallery of the Alpine Club.

Here we find a collection of works to the number of nearly two hundred and fifty, and of these we are attracted by the respectable percentage of thirty. There is very little that is actually poor, and if a large proportion is indifferent and mediocre it is what must be expected where some eighty or more artists combine for one exhibition.

The President, Mr. L. B. Bruhl, is represented by eight canvases—a characteristic display, half Dutch and half English, and of these we will select one of each class for notice. "The Weeper's Tower, Rotterdam," charms by its happy harmonious colouring and good atmospheric effect; whilst "Winter's Mantle, Battlesbridge," with its snow-clad river banks and its half-dismantled buildings similarly clad, is in the artist's more familiar style. Mr. Walter Stacey, Vice-president, is also well represented, and of his six exhibits two call for notice. "A Devonshire Cobbler" shows a well-modelled figure, the brushwork throughout being good, and "Winter in the West Country," though portraying some indifferent sheep, is in other respects good, the haze in the atmosphere being vigorously put in. Of the four exhibits of the other Vice-president, Mr. R. S. Standen, it suffices to refer to "Il Torrone, Valle Crosia, Borighera" (No. 31); its colouring is distinctly pretty (the adjective, by the way, which seems to express most frequently the colouring throughout this exhibition), but this picture shows

no breadth of treatment, and the brushwork is finicky. Mr. T. A. de Moleyns is the most fully represented numerically with a series of Riviera sketches, undoubtedly the best being some of the Mentone views. "Eventide," worked from a quiet and sympathetic palette, "Bellevue Hotel," "Amirante," and "Annunciata" are all good and pleasantly recall the work of Miss Ella du Cane; this lady's work is, curiously enough, brought to mind by various of the pictures displayed. In this connection mention may be made of "Villa Capella, Bordighera," by Miss Edith Adie, who shows two other works also, of which "Oleanders, Lake Como," deserves warm approbation for its colour-scheme, its modulation, and its atmosphere all in combination. To Mrs. Rose Hake's five works it is not possible to give the cachet of great merit; she has well depicted the bloom in "August Heather, below Farragon," but her Westminster Abbey sketches are not pleasant; the stained-glass window is the insistent feature in "The Nave," whereas in our dear Abbey a pleasing note is that the stained glass fills in the various views and vistas, without obtruding itself. Contrast Mrs. Hake's "Gate of Henry VII.'s Chapel" with Mr. J. Cafe's Abbey etchings. "In the Cloisters" and "Entrance to the Deanery and Jerusalem Chamber" are both good, the former especially being a vivid representation of what we know so well. His third and really imposing exhibit, "Moonlight in St. Paul's Cathedral," is a masterpiece, showing the effect of environment upon the artist and his sense of the fitness of time and place; the light, just breaking on the cornice and thus relieving the blue-black gloom, needs to be seen to be appreciated fully.

Mr. Nigel B. Severn has, amongst his six exhibits, one work, "Portuguese Fishing Boats off Cape Roca," which stands side by side in merit with the last-mentioned picture. This is, as it happens, also a moonlit scene, where the cold luminary presents its orb above and its light glancing over the water beneath, with a red glimmering as of a glow-worm, set in the background cottage. "St. Giles', Oxford," by the same artist, is good in neutrals, a rather pleasant change from the prevailing treatment in primaries and secondaries. Miss Brace's "Primroses" is sympathetically treated, which cannot be said for her "Roses." Mr. Le Roy's technique in "Vibré" is too cardboardy, but "An Old Brittany Town," showing a narrow street, is good brushwork. We like Mr. W. G. Whittington's four works; "The Tower Bridge" is very delicate and presents quite the local effect; "A Herring Drifter" and "A Fine Breeze" are really breezy, and in these and "Lowestoft" the artist exhibits his mastery over his subjects. Miss Hall has a good piece in "Wintry Weather," with its flock of sheep in the foreground and the declining sun in the far distance; in "Reaping" her three horses are well modelled and stand out forcibly, but the growing corn is very poor brushwork. Mr. E. W. Hereford shows a masterly treatment of skies, but lacks breadth of touch, though in "Tintern Abbey" this defect is less pronounced.

Mr. J. Carlisle shows a lamentable ignorance of cloud-modelling, his daubs in this direction being inexcusably poor; he, however, redeems by "A Highland Water Party" and "Loch Etive," a pair of pretty little sketches, what would be otherwise an unfavourable impression of his work. The bold rolling clouds, pierced by rugged peaks, in Mr. H. R. Donne's "The Mine Glacier, Fer Perles Valley," are very good, this picture being a striking contrast to the same artist's "The Blumisals," where the effect is as of a picture such as one might see on a grocer's canister. Mr. Powell in "The Christchurch Gate, Canterbury," and "Patricbourne, Kent," shows his powers, though the colouring of the houses in the former is perhaps exaggerated. Mr. Holroyd is too hard in his touch and does not grasp the value of part closing of the eyes when portraying what he sees.

Mr. Topham Davidson has a poetic morceau in "The Rising Morn," with its grey rocks, its moored boats, and the quiet lapping waves; his "Late Autumn, Jersey," shows an effective twilight. Mr. R. Walters has produced the desired effect in "On the Wye at Sunset," and "The Evening Hour" is a pretty piece with good brushwork for the trees, the sky, and the water. Mr. Parkyn has a curious mannerism in his work—an albinosque treatment, it may almost be called. Mr. F. Parks is cardboardy in "St. Davids Cathedral," but has a very delicate piece in another Welsh sketch, "Lower Fishguard." Mr. F. J. Aldridge's "In the North Sea," showing a boat heeling heavily under storm-capped skies, is excellent.

Mr. C. Marrable is fond of Dunbar and has studied the harbour to good effect. Miss Hopton's "Fishing Boat off Palma di Mallorca" is very good in blues and greys. Miss M. E. Howard's "Delphiniums" is one of the few good

flower pieces. Mrs. M. J. Moberley has two good dog studies, "Who Said Sugar?" being very vigorous. Of all Mr. Coleridge's works it is necessary to call attention to "Salisbury" alone, which presents all the quiet atmospheric effect of provincial England down in the West. Mr. George Marks' "Gorse in Bloom" is good all through.

Miss Evelyn White's "Low Tide" is good brushwork, and Mr. Rooke in "The Falls of Leny, in Spate, Perthshire," is meritorious. "Rahere's Tomb, St. Bartholomew's," by Miss Hughes, is very poor indeed; and Miss Hartley, in "An Old Farmyard," is much too woolly. The last picture in the exhibition must not be passed by without approving notice; this is Mr. H. Terry's "Darby and Joan," which is pathetically pretty in treatment and colouring. The model for Darby is perfectly lovable, and all our quarrel is with the cat, which we trust is achieving its ninth incarnation, for the sake of our future peace of mind.

ANCIENT AND MODERN FABLES ILLUSTRATED BY MR. ARTHUR RACKHAM.

EVERYONE loves Æsop and his Fables, and it may be supposed that "Peter Pan" is beloved of a most respectable majority; and all these fables have evidently inspired Mr. Arthur Rackham, whose work in illustration now decorates one of the Leicester Galleries.

A more delightful little cherub than the artist's Peter or a more attractive little girl than Maimie it would be hard to conceive. The method of depicting the humanised trees and flowers is very expressive, and in regarding "The Paths that have made themselves" there is apparent quite a poetic touch in the effect of light in the sky, of distance, of atmosphere.

And what praise is adequate for the colour harmonies? Edmund Dulac and Arthur Rackham would seem to have studied in the same school (to judge by their work), and to be the two best exponents of the teaching as regards colouring.

Some of the illustrations are *en silhouette*, amongst others the tailpiece to "Peter Pan," where the children's figures are all that can be desired, the dogs alone being indifferent. "Solomon Caw," as presented by Mr. Rackham, recalls to mind the technique of Joseph Crowhall, and this is even more apparent in some of the illustrations to "Æsop," such as "The Fox and the Crow" (but the section of Dutch cheese is gigantic), "The Crow and the Pitcher" (the latter poorly drawn), "The Cat and the Cock," and "The Cock and the Jewel." The expressive faces of the two rodents in "The Town Mouse and the Country Mouse" are magnificent—the one so town-jaded, the other so rustic.

In some instances the treatment is rather trifling, such as "The Lion and the Gnat," "The Bull and the Gnat," "The Hound and the Hare," and "The Monkey Dancing" (the latter *en silhouette*). And in referring to silhouette illustrations, those for "The Man, the Boy, and the Ass" are excellent.

As with "Peter Pan," Mr. Rackham has also humanised some tree sketches on show, some of them particularly clever, others more ordinary. The order of merit is to be conferred upon "The Two Pots" (where "Uncle Toby" is exquisite), "The Gnat Caught by the Spider" (a very powerful drawing), "The Wolf and the Crane," "The Wolf and the Goat" and "The Bear and the Fox."

The finest all-round drawing is, in our opinion, "The Shipwrecked Man and the Sea," showing the spirits of the malign powers in contrast with the insignificant mortal, to whose indifferent eyes are displayed the pearly treasures of the ocean-bed.

Though some of the drawings exhibit signs of roughness or incompleteness in treatment, yet the general level of excellence in "Peter Pan" and Æsop's "Fables" is remarkable.

THE HYGIENIC ASPECTS OF GAS FOR HEATING AND LIGHTING.*

(Concluded from page 216.)

MISTAKEN IDEAS.

THERE are still among us people who believe that carbon dioxide is the root of all hygienic evil, and that as it is so much heavier than air than it can be poured from one vessel to another—they believe that the forces which cause air to

* A Paper by Professor Vivian B. Lewes, F.C.S., F.I.C., read on October 8 at Manchester before the British Commercial Gas Association.

rise will be insufficient to cause the ascension of the products of combustion and respiration. Let me, however, remind those individuals of the old fire balloon, in which the combustion of some burning spirit on a sponge renders the products—the same as from gas—so light that not only do they ascend but carry up the weight of the balloon envelope, with a margin to spare. It is upon this power of setting air in motion and promoting diffusion that gas bases a good deal of its hygienic superiority as an illuminant; while the sterilising effect of the flame and the trace of sulphurous acid in the products gives the reduction in organic matter and bacteria that forms the second desideratum of Dr. Leonard Hill's perfect system of ventilation.

As the amount of heat for a unit of light given by incandescent gas lighting is so far in excess of that given by the electric incandescent lamp, and as water vapour is one of the chief products of the combustion of gas, it may appear to some that the coolness and proper degree of relative moisture insisted on by Dr. Hill can be obtained only by lighting by electricity; while Dr. Hill himself has shown that an electric fan will give the necessary movement. Apart from the cost of using extra current for a fan to complete the work of a source of light that is already dearer than gas, it must be remembered that the air under these conditions becomes so befouled with decomposing organic matter as to be unpleasant to the nose, even if not actually injurious to health; and we have no desire to live in an atmosphere having an odour of the kind that greets us when we reach the booking-office of a tube station from the comparatively fresh air of the street. Certainly we rapidly get acclimatised to it, and in a few minutes our nose ceases to be worried by it, but the esprit de corps is still there, although electric light, electric fan, blower and pump have all been working their hardest to keep the air fresh, and there is certainly no stagnation.

THE PROPER DEGREE OF AIR MOISTURE.

The proper degree of relative moisture in the air is a question which it is not easy for the uninitiated to grasp, as it is hard to realise that a certain weight of water vapour may at one temperature saturate the air completely and render it so oppressive to live in that health is seriously affected, while a difference in temperature might make the same weight of water the right quantity for carrying on life under the best conditions. The important factor is not the amount of water vapour present per cubic foot of air, but the percentage of the amount the air is able to contain at the particular temperature. If the percentage is too high, then evaporation from the body is checked; but if sufficiently removed from the point of saturation, then the functions of the body are unimpaired and health unaffected.

In a closed room we have three sources of aqueous vapour to consider—the amount present in the outside air that is supplied to the room, the amount given off by the occupants of the room, and the amount contributed by the illuminants; while in a fireless room the temperature will be governed by the exterior temperature, the heat given by the bodies of the occupants, and the illuminants. The amount given by these sources other than the exterior air per hour may be tabulated approximately for 60 to 70 candles illumination as—

	British Thermal Units.		Water Vapour.
	Gross.	Net.	
Man	446	340	700 grains (Rideal)
4 cubic feet incandescent gas	2,140	2,080	1,600
3 lamps, incandescent electric	900	900	

So that, taking heat and water vapour as the factors of motion that lead to currents and diffusion, it is seen that in a room lighted by one incandescent mantle and containing two people we have 2,700 B.Th.U. and 3,000 grains of water vapour to act as a motive force, against 1,580 B.Th.U. and 1,400 grains of water vapour when electric lamps are employed. Inasmuch as neither temperature nor humidity show any great difference at the breathing level whichever source of illumination is used, it is evident that the force has been expended on diffusion—a point made perfectly clear by the superior organic purity and carbon dioxide content of the breathing space.

I have no desire to make any invidious remarks with regard to electric lighting. There is no doubt as to its convenience and decorative value in houses built with proper regard to ventilation, in which lofty rooms, ceiling ventilators, and Tobin tubes amply safeguard the health of the inhabitants; but I do strongly protest against the methods of the electrician who attempts to displace gas as an illuminant in the homes of the large proportion (where small

rooms devoid of any scheme of ventilation other than those provided by the fire-place and jerrybuilders are the rule) by false statements as to the dangers of gas, which, under these conditions, is an invaluable engine of ventilation.

THE VARIED USES OF GAS.

Gas fires, cookers, water-heaters, and engines have at the present time all been developed to a point which makes a consideration of their hygienic value of the greatest importance, as ever since Bunsen, in the early fifties, gave us the atmospheric burner, in which non-luminous combustion of the gas is obtained and the blackening of articles heated in the flame is avoided, gas has progressed so steadily for heat and power, as well as for lighting, that nowadays its use for these purposes is nearly as great as for illumination.

GAS FIRES AND VENTILATION.

The open fire place consuming coal has always been a representation of one of our great English characteristics. Never mind its wastefulness and its polluting effects on the outer air, it is a good companion; it heats a room in the right way—that is, by radiant heat and not by convection; and the enormous volumes of air drawn up the chimney by the draught make it a valuable engine of ventilation. One of the great prejudices which has always existed among sanitarians against the gas-fire has been the supposition that its installation would do away with the ventilating effect of the open fire, and so render the air more unhealthy, and, further, that the cost of the gas-fire was considerably greater than that of coal.

COST COMPARISON.

The last objection, which certainly is one of the most serious in hindering the adoption of gas-fires, is based largely upon fallacious methods of estimating the comparative costs of the two, as when reckoned, as is usually done, by the cost and number of British thermal units present in a pound of coal and in a cubic foot of coal gas, the gas, roughly, would cost about five times as much as the coal for the same number of units. When, however, we take into consideration the efficiency of the grate, we find that the difference practically disappears. With a modern gas-stove we can obtain not only the warming of our rooms under conditions every whit as hygienic as with a coal-fire, but at a cost which is practically the same, as when coal is burnt in an open grate only one-fifth of the heat units present in it are conveyed to the air of the room, while with the modern gas-stove nearly four times as great an efficiency can be obtained. The balance in cost is amply made up for by the cleanliness in use, by the absence of dust and labour entailed in the supply of fuel to the coal-fire, and by the economy of lighting the fire only when it is wanted and turning it out when done with—to say nothing of the fact that it goes out only when the tap is turned off, and that the noise and effort of stoking are dispensed with.

HYGIENIC CLAIMS OF THE GAS-FIRE.

In considering the hygienic claims of the gas-stove, we must take into account, first, the way in which the heat passes from the stove to the room and its occupants. With the coal-fire this is done almost entirely by radiant heat, which does not directly raise the temperature of the air, but radiates heat to the floor, walls and furniture, which absorb it and again slowly part with a portion of their heat to the air in contact with them; so that the walls and other solid bodies in the room are at a higher temperature than the air. There is no doubt as to this being the true method of heating. It is the way that Nature heats the world, and the sun's rays beating down through the atmosphere leave it fresh and unwarmed; but as they reach solid matter they rapidly raise its temperature, and the solids, in turn, by convection gradually warm the air.

Apart from its being much more healthy to breathe cool than hot air, there is another important point to consider. The normal temperature of the body is 98° Fahr., and this temperature is maintained by the slow combustion processes going on in the body. By the laws of radiation, a heated surface parts with its heat more or less rapidly, according to the temperature of the surrounding bodies; so that if a person be sitting in a room filled with warm air, but near to a wall colder than the air, his body will rapidly part with heat by radiation to the wall, and a sensation of chill is the result. With the open fire this is never the case, as the radiant heat from the fire heats the walls of the room to a temperature higher than that of the air.

When, however, a room is heated by hot-water pipes, steam, or any of the central methods of heating now so popular, the temperature is raised by convection—that is,

the air in contact with the heating surface is raised in temperature, expands and sets up convection currents, this taking place until the whole of the air in the building is raised to a given temperature. Heating of this kind, however, always suffers from the drawback that the air is hotter than the walls and other solid bodies, so that, although a room may feel oppressively hot, a chill may easily result from the body radiating heat to the walls.

SUPERIORITY OF GAS-FIRE OVER COAL-FIRE.

In the best forms of gas-fire, the burning gas heats radiating material in such a way that a very large percentage of the heat of the gas is converted into radiant heat, and passes into the room in the same way that the heat from a clear coal-fire does; while the convection heat, which used to be the chief source of the heat of the gas-fire has been reduced to a minimum. The efficiency of the stoves has been so increased that over 60 per cent. of the total heat in the gas is utilised, so that, in heating effect, the gas-stove is far superior to the coal-fire.

The mistake was made in the early days of the gas-stove of filling up the space between the exit flue and the fireplace completely, so that all the air from the room had to be drawn through the radiant mass in the grate, this leading not only to diminished temperature, but also to a decrease in the amount of air withdrawn from the room. If, however, the flue of the gas-stove be carried some little distance up the chimney and a space be left around it, this will act as the injector of the Bunsen burner, and withdraw from the room nearly as large a volume of air as the open fire does, while the cooling effect of the gases and air upon the radiant material is avoided.

Probably the most valuable work on the hygienic aspect of gas heating and lighting is to be found in some work done by Dr. F. S. Toogood on the ventilation of the wards of the Lewisham Infirmary, in which he carefully compared the condition of the air in a ward heated by gas-fires and illuminated by incandescent burners with that of a ward heated by open coal-fires and without artificial illumination. He proved conclusively not only that gas consumed in modern incandescent burners can be used for lighting without any detriment to health, but that, in fact, it assisted ventilation by the increased circulation of the air, and that a gas-fire, properly constructed and fixed, not only does not vitiate the air, but is a valuable adjunct to the ventilation of the room, apart from its manifest advantages in reliability, avoidance of noise, freedom from dust, and economy in use.

His work is of great interest, as he compares the percentage of humidity in a ward lighted by incandescent burners with one in which there was no artificial illumination, and in which the air was warmed by an open coal-fire, and found that in both cases the humidity of the air in the room was something like 20 per cent. less than in the exterior air.

With the old forms of gas-stove, in which the mistake was made of trying to utilise most of the heat value of the gas by causing it to heat air, which by convection raised the temperature of the air and not of the solids in the room, the percentage of humidity was so decreased that it caused rapid evaporation from plants and the occupants of the room, producing drooping in the former and discomfort, dry lips, and smarting eyes in the latter; and the cry that gas heating "dried the air" was raised against its use, while bowls and saucers of water were placed in front of the stove to add water vapour to the air, and so decrease the discomfort.

The cause of this trouble disappeared when once it was recognised that radiant heat was the only true and hygienic method of heating; and in the modern gas-stove the amount of radiant heat has been increased to the maximum attainable, and convection plays a very small part.

WHERE CONVECTED HEAT MAY BE USED.

While with justice we condemn utterly all systems of heating which raise the temperature of the air by convection alone, we must not lose sight of the fact that when rooms or halls of large cubical content have to be warmed, convection, which as a chief or primary source of heating should never be used, may yet play a very useful rôle as a secondary adjunct to radiant heat. Where convected heat is used as a sole method of heating, the air has to be raised to a high temperature to ensure its carrying the heat over a large area; and this excessive heating makes it so hungry for moisture that the discomforts incidental to the old gas-stove are reproduced, and we have conditions of the most unhygienic character. For raising the temperature of the air of a large space two or three degrees, to aid and hasten

the effect of radiant heat, what I may call "low temperature convection" is often of the greatest value.

Take, for example, a large schoolroom on a cold winter's day. No single gas or coal fire could supply the radiant heat to warm the whole room to the right degree before it was occupied in the morning; but if radiators—so-called because they give nothing but convected heat—are fixed in two or more places below the windows, they will give the air the two or three degrees necessary to enable the radiant heat of the gas-fire to quickly complete its work of raising the temperature of the solids in the room, and yet in no way will detract from the hygienic conditions. For such a purpose gas-heated steam or hot-water radiators answer perfectly well.

In a climate such as ours, in which we often run the gauntlet of the four seasons in twenty-four hours, the ease and quickness with which a gas-heating system of the right type can be brought into play is no small asset in its favour; and although in the abstract we may be willing to accept Dr. Leonard Hill's dictum that cold and hunger are thoroughly hygienic, we also feel that, unless specially trained to enjoy them, a middle course is the best for us individually.

CONCLUDING REMARKS.

I think I have said enough to show that coal gas as now used in the incandescent burner and modern gas-fire is by far the most hygienic illuminating and heating agent that we possess for rich and poor alike, and that the dwelling-house, school and workshop are all rendered more healthy by its action, while the change that has taken place in the atmosphere of our large towns during the past ten years—the lessening of smoke, the rarity of bad fogs, and the increase in the hours during which the sky can be seen—bear eloquent testimony to the work already done by the partial displacement of the coal-fire by the gas-stove in helping to rid the country of the smoke curse.

BOOKS RECEIVED.

- "Early Christian and Byzantine Architecture." By Edith A. Browne. Containing forty-eight full-page illustrations reproduced from photographs. In the series of "Great Buildings and How to Enjoy Them." (London: Adam & Charles Black.)

COMPETITION NEWS.

CAMBRIDGE.—Mr. P. Morley Horder, F.R.I.B.A., 148 New Bond Street, W., has been successful in the limited competition for new buildings in connection with Cheshunt College. Sir Aston Webb, C.B., R.A., acted as assessor. Eight architects were invited to compete. The work will cost about £20,000.

CANADA.—The Imperial trade correspondent at Winnipeg reports with reference to a competition for a Town Hall at Winnipeg, to be erected at an estimated cost of 3,000,000 dollars (about £616,600), that the competition in question is open to architects both in Canada and the United Kingdom. Applications for full particulars should be made to the Mayor, R. D. Waugh, Esq., City Hall, Winnipeg.

DUBLIN.—Mr. Henry T. Hare, F.R.I.B.A., the assessor, has reported to the Buildings Committee of University College, Dublin, the result of the competition for designs for the proposed new college buildings, and has made his award as follows:—(1) Messrs. Dillon & Butler, Dublin; (2) Messrs. Arthur & H. H. Hill, Cork; (3) Mr. Thomas J. Cullen, Dublin. The competition was limited to architects living and practising in Ireland.

NEWCASTLE.—The Town Council have authorised their Housing Committee to advertise and offer for open competition three prizes of £50, £30, and £20 respectively for sketch (pencil) plans for the laying out upon model cottage lines of the 80 acres of land on their Walker Estate.

FORTHCOMING EVENTS.

Monday, November 4.

Royal Institute of British Architects: President's Opening Address at 8.30 P.M.

Tuesday, November 5.

Institution of Civil Engineers: President's Opening Address and presentation of medals.

Wednesday, November 6.

Nottingham Architectural Society: Exhibition and Criticism of "Constructional Details and Testimonies of Study" by Mr. W. R. Gleave, A.R.I.B.A., at 8 P.M.

Institute of Sanitary Engineers: Paper on "Meteorology and Public Health" by Mr. W. Marriott, F.R.Inst.Soc., at 8 P.M.

Royal Archaeological Institute: Paper on "The Walled Town of Aigues Mortes" by Mr. C. H. Bothamley, M.Sc., at 4.30 P.M.

Thursday, November 7.

London University: Course of Lectures on "French Renaissance Architecture" by Mr. W. H. Ward, M.A., F.R.I.B.A., at University College, London, at 6 P.M. Lecture 5.

Architectural Association Camera Sketch and Debate Club (Novices' Night): Papers by Mr. H. Bart Tunnard and Mr. H. E. Moss at 8 P.M.

JOINTLESS FLOORS.

THE obvious advantages of a floor which shall be absolutely jointless and which can be laid *in situ* to any shape of plan has led to this form of construction being widely adopted by architects since the introduction, some few years ago, of magnesian cement and the realisation of its remarkable properties as a matrix for setting in combination with almost any form of aggregate. Unfortunately the experiences which have resulted from the use of these floors have frequently been unsatisfactory.

Disintegration of the floor material itself, deterioration of the concrete foundation, and, above all, deleterious action upon iron and steel have all been troubles which have accrued from the use of some of the many forms of jointless floor which have been placed upon the market within recent years.

The causes of these failures have not always been identical, for the materials of jointless floors have been varied by different manufacturers. For the most part the aggregate has been sawdust or wood fibre, but other substances have also been used, asbestos amongst them. On the other hand, Portland cement has been used for the matrix, sometimes alone, sometimes mixed with a magnesian cement. The disintegration of the floor itself has generally been due to unwise experimenting with various materials for aggregate and matrix.

There is no doubt that a floor can be made of sawdust and Portland cement, but it requires particular care and exactitude in the proportioning and preparation of the two materials, and mischief may be done by the addition of colouring matter of an unsuitable nature, so that it is distinctly difficult for the manufacturer to rightly proportion his aggregate, his colouring material, and his matrix. When he uses magnesian cement for the binding material of the floors the magnesium chloride has, frequently, a seriously injurious effect upon concrete, iron, and steel, and to this we are inclined to attribute the greater number of failures that have occurred in the use of jointless floors of modern types which have recently superseded the older method of Portland cement rendering on concrete. It is not surprising that many architects, after bitter experience, have formed a determination to have nothing more to do with the modern jointless floor.

We have, however, made the acquaintance of such a floor which we think may be used with confidence. This is manufactured and laid by Messrs. Broadfoot and Co., of Glasgow, under the trade name of "Teakoid," and

in its preparation the manufacturers appear to us to have solved the two great difficulties (1) of producing a permanent and satisfactory floor; (2) of preventing the ingredients of the floor from acting deleteriously upon its support, whether of concrete or iron; and we have made a careful examination and test of the floor and also of the underlay which is used by the manufacturers to prevent the injurious action of magnesium chloride when used as a constituent of the matrix. We find that, although the floor is not free from tendency to wear, this occurs evenly and imperceptibly without disintegration of the surface or cracking where the support is inflexible.

This material has been used in several vessels of the Allan Line, in some of which for a period of upwards of three years it has stood the wear and tear of exceptional hard usage by the peculiar nature of the traffic which these steamers carry. From Scotland to America the floors laid with "Teakoid" are subjected to the roughness of third-class emigrants, Poles, Lithuanians, and other low-grade nationalities.

On the return voyage the cabin fittings are removed and the vessel becomes a cattle ship. A floor which will stand the wear for three years of the roughest class of emigrants and cattle has a *prima facie* claim to durability.

We have also seen examples laid five-eighths of an inch thick on an old wood floor, where it showed only a few regularly disposed cracks due to the deflection of its support. In another instance the flooring had been laid only a month and was sufficiently hard and successfully resisting the wear and tear of a metal working shop, where acids, paraffin and other oils were constantly being spilt.

The manufacturers appear to have solved also the problem of selecting appropriate and non-injurious colouring material, and have produced a wide range of tints which can be employed either as uniform masses or with veined and mottled distribution, producing much of the effect of marble.

To prevent disintegration of concrete and detrimental action on iron and steel when used as a foundation for the floor the manufacturers employ a liquid preparation as an underlay which by reaction with magnesium chloride forms a stable and inert compound, thus preventing injurious action by the chloride, so that this serious cause of trouble is eliminated. On all grounds, therefore, we consider that in "Teakoid" we have a jointless flooring material that may be used with confidence in its durability.

NOTES AND COMMENTS.

THE difficulty of doing justice all round in dealing with ancient monuments is making itself felt in the consideration by the Joint Committee of the House of Lords and House of Commons of the three Bills now before Parliament, which have been introduced for providing for the better protection of ancient monuments in this country. The Duke of Rutland as a representative owner of ancient monuments naturally raised various objections, and in particular objected to one Government body being able to force the sale of a monument or building at an arbitrary price fixed by another Government body. He urged that a monument might be of no intrinsic value at one time, but from competition of expert investors it might in a short time become of enormous value. This clearly refers to the eccentricities of the "old master" market, the development of which has focussed the attention of the public upon the necessity of protecting our ancient monuments from the pecuniary temptation offered to their owners by the fictitious values so adroitly exploited by dealers in old masters and other antiques. We can understand that owners are reluctant to sell to the nation at their intrinsic value property for which a fictitious price may be obtained, when the superfluous dollars of Chicago are seeking an object of exchange. The ethics of property is, however, too large a subject for us to discuss in this column.

Mr. Thackeray Turner, in his evidence before the Joint Committee, made a very true answer to the objections that have been raised by some of the Bishops to the inclusion of ecclesiastical buildings amongst ancient monuments, whose preservation should be provided for by statute. He said that the Church had all the apparatus for guarding churches and ecclesiastical buildings from injury, but the Church authorities did not put them in force. Undoubtedly considerable damage had been done in recent times in a large number of cases by structural alterations and demolitions, and he gave as a notable instance Puddleton Church, in Dorset. If the ecclesiastical authorities did not, or would not, do their duty in this respect he would have some Government body which would do it for them.

The rapid development of the Doncaster Coal Field seems to have been too much for the Town Planning activities of the South Yorkshire District and Urban Councils. Although eighteen months have elapsed since a Town Planning Conference was held at the Mansion House at Doncaster, to consider the desirability of forming a scheme for the whole of the Doncaster district, nothing in the way of concerted action seems to have been taken, and everybody is waiting for somebody else to give them a lead. The responsible authorities have now no time to lose in the provision of healthy and well-planned villages and townships that will soon be springing up like mushrooms around them. They have, too, a golden opportunity in having what is, in effect, a virgin country to build upon.

The peculiar difficulties of Town Planning become evident when a scheme arrives at the stage of a Local Government Board Inquiry, as has been shown by that held on the application of the Birmingham City Council for approval of their East Birmingham Town Planning scheme. The scheme allots certain zones for different classes and numbers of houses to the acre and certain spaces for factory sites and other spaces for allotments. Then come objections from various owners that on one ground or another they are being hardly dealt with by the compulsory allocation of their property to a specific line of development. Again we have the big question of the ethics of property coming into consideration, and the public weal has to be brought into line and harmonised as far as possible with the rights of the owners.

We are pleased to note in our contemporary *The Irish Builder* that it is an admitted fact that a most rapid and substantial revival has recently taken place in the building trade in Dublin, and there is a general air of briskness and prosperity that the trade has not seen for at least a decade past; most of the builders are very busy; unemployment in the building trades has almost disappeared, and all signs indicate a continuance of this briskness. The Dublin building trade has passed through a period of unexampled depression, and it is to be hoped, now that the tide has turned, that it may decidedly flow in the direction of a long period of real prosperity. We wish the same could be said of the building trade in London or in any other large city in England.

The medical officer for Merionethshire, Dr. Robert T. Edwards, in his annual report invites the assistance of the clergy in denouncing the owners of slum property who make their incomes out of unhealthy houses at the expense of losing valuable lives, and supports his indictment of the insufficient attention given by the churches to the health of the community by a reference to the defective ventilation which often characterises our places of worship. The members of the congregation, he says, are often rebuked by the preacher for showing signs of indifference to his sermons by falling asleep, and, if the truth was only known, this somnolent condition of the brain is not due to a lack of interest in the service, but to a poisoned condition of one's mental activity through breathing the impure atmosphere of a badly-ventilated building.

We regret to note that the controversy in Liverpool over the podium of St. George's Hall is rapidly deteriorating into a slanging match, and whilst we sympathise with those who desire to preserve the integrity of the podium we think that they are doing immense harm to their cause by their undignified attacks on their opponents, and we are not surprised at the reprisals thereby provoked. It is a matter of the deepest regret that the question is no longer one of æsthetic propriety but of party politics. Even so, it is a pity that the worst features of a political contest should be introduced into the discussion. Even as a matter of tactics it is surely inadvisable for the defenders of the podium to attempt to retrieve the defeat of their æsthetic arguments by a resort to the methods of an American presidential contest.

KENSINGTON AND KENSINGTON PALACE.*

THE former village or hamlet of Kensington (now designated the Royal Borough of Kensington) has to-day become a part almost of central London. It existed in the Conqueror's time, and the manor was granted by him to Alban de Vere created later Earl of Oxford. There was a church there, which was granted by de Vere in Henry the First's time for the use of the Monastery of Abingdon, in which Abbey his second son was buried—at a later date some disputes arose between Abingdon and Colne (Essex), where a branch monastery had been set up, as to control over the Kensington Church, resulting in the living being placed at the disposal of the Bishop of London. Westminster was the nearest village on the side towards London, separated from it by fields and meadows extending from the river to the westward highway from London to Kensington and Hammersmith, and beyond this northwards to the other westward highway leading to Uxbridge, through which meadows meandered streams making their way to the Thames. One of these, called the Westbourne, drained the area of Paddington and probably also that of districts much further northward, coming through the locality we now know as Bayswater; it crossed the intervening meadows (now Hyde Park and Kensington Gardens) in which it expanded into various ponds, some say as many as eleven, and generally produced a marshy and reedy condition of the ground in its course. Near its crossing over the Uxbridge Road was

* Read at a meeting of the Upper Norwood Athenæum by Mr. Frederick Higgs.

probably a pond by the roadside, and the manorial rights thereabouts belonging (see Domesday) to one Bainiardus, or Baynard, it took the name of Baynard's watering, since corrupted into Bayswater, a title now applied to the whole district. At its southern end it crossed the highway to Kensington, and a bridge was there erected and called Knights-bridge, it is said owing to an encounter which was fought thereabouts between certain bold knights of early times. The thoroughfare from Hyde Park Corner to Brompton Road is still called by that name.

There appears to have been some springs existing in or about these meadows, as it is recorded that Edward the Confessor granted the use of some to his college of St. Peter's, Westminster. The site of these springs is indicated to-day by a pedestal having a suitable inscription standing near the north end of the great dam, and as late as 1663 Charles the Second granted a concession for 99 years at 6s 8d. per annum to one Thomas Hawes to use, perhaps the same spring which may have been alienated at the time of the dissolution in 1553. This person at his death, left the rights to the poor in certain parishes, viz.:—St. Martins-in-the-fields, Watford, Berkhamstead and others; but, in 1731, George the Second bought up the unexpired term of this lease for £2,500. The meadows bounded by the Kensington

foggy atmosphere of Whitehall, which was probably additionally distasteful by reason of its tragic Stuart associations. He succeeded in buying for £18,900 "Nottingham House," a moderate-sized but comfortable mansion at Kensington's eastern end, with 150 acres of park land attached thereto. This property had belonged for a generation or two to a family named Finch, one of whom (Sir Heneage), Lord Chancellor, created Earl of Nottingham, erected the mansion. His son and successor, Daniel Finch, the second Earl, sold it to the Crown. The King at once set to work upon alterations and improvements, under the direction of Sir Christopher Wren, with Nicholas Hawksmore as clerk of works. These continued for some seven years, involving an expenditure of something like £100,000 upon the building works alone. Considerable misfortune seemed to have hampered the progress, as in November 1689 one of the new buildings collapsed, killing seven or eight of the workmen, while two years later a fire occurred, causing damage to the tune of £6,000.

Wren's work, as we shall see in due course, exhibits his usual excellence of detail and proportion: it is quiet, solid, and good.

Queen Mary was constantly on the spot, superintending the work, and apparently had a narrow escape from injury

KENSINGTON PALACE AND GARDENS temp. QUEEN ANNE.

Road on the south; Tyburn Lane (now known as Park Lane), on the east; and Uxbridge Road, on the north, had been acquired, nobody knows quite how, by Henry VIII. for a Royal riding or hunting ground, and at the beginning of the sixteenth century were, as described above, pleasant meadows through which flowed the stream which, with springs, served as a water supply. On Cromwell's accession to power the land (known as Hyde Park), being considered Royal property and, therefore, useless, was put up to auction in four or five lots, but upon the Restoration in 1660 "the King came to his own again," and the purchasers were in turn dispossessed.

The highways both south and north were, like most other roads of early times, ill-made, only passable for vehicles in dry weather, mostly bog and morass in such wet seasons as we have been having lately, and quite without lights. They were, therefore, dangerous to use after dark to the lonely and unarmed traveller, being happy hunting grounds for the "gentlemen of the road."

Such was the condition of the district and approaches when, on the accession of William and Mary in 1689, the former sought for a new residence conveniently near to the Government at Westminster, but away from the smoky and

in the accident before mentioned, as it is recorded that she was in the apartment but a short while before. She also wrote to the King, who was busy subduing rebellious Ireland, "The outside is fiddling work, and takes up much more time than can be imagined." It is ever thus with clients, Royal or otherwise. At the same time William and Mary were busy re-modelling, to a large extent, the gardens in the Dutch style; and, in order to make a fitting approach to the new Palace, and to avoid the difficulties and dangers of the public highway, the King caused to be formed a broad new straight road from the south-east corner of Hyde Park, marked on some of the old maps as King's New Road, on the line now taken by the Carriage Road.

The inscription upon Kip's engraving of the Palace and gardens in Queen Anne's time says: "The avenue leading from St. James's through Hyde Park to the Palace is very grand; on each side of it lanthorns (stated by one authority to number 200) are placed at equal distances, which, being lighted in the dark seasons for the convenience of the courtiers, appear inconceivably magnificent."

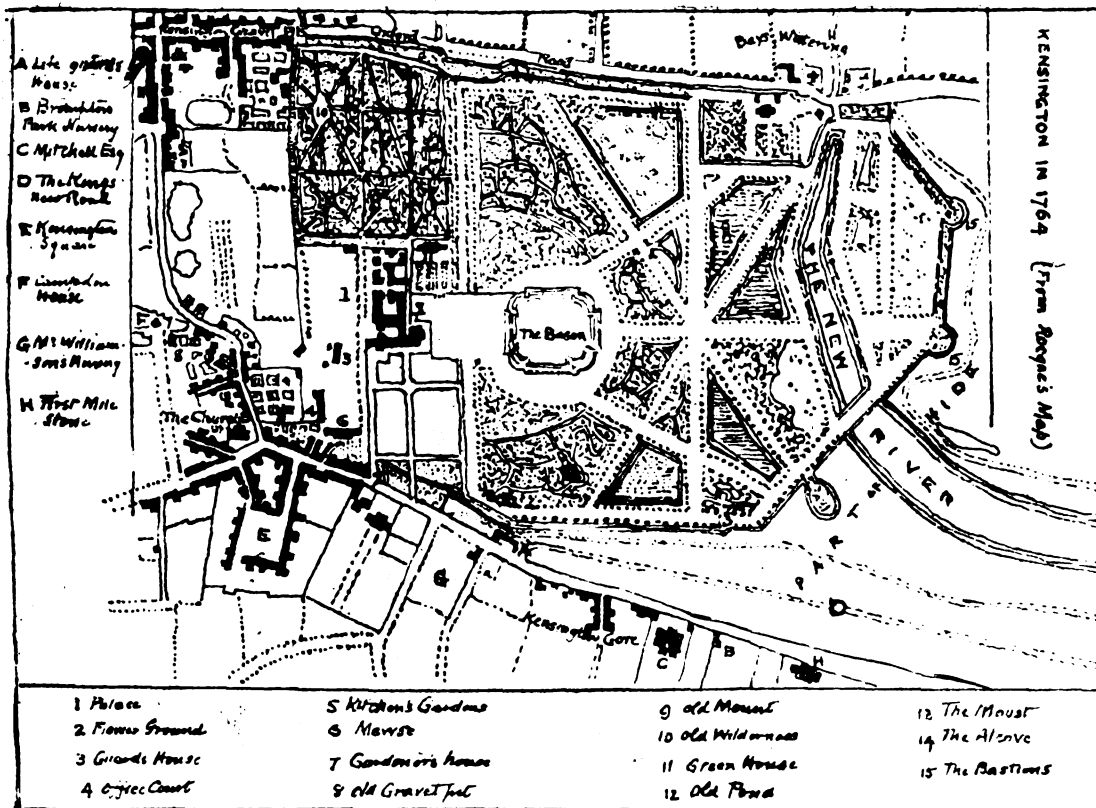

Queen Anne's energies in respect to alterations chiefly lay in the gardens and park. On the north side of the Palace there were meadows and gravel pits, and these were to a

large extent transmogrified and the gravel pits filled up. The Broad Walk, and probably many of the other avenues, were formed and planted. Wren was commissioned to build the Orangery, originally erected as a Banqueting House or ballroom, and often used by Anne as such, and the boundaries of the gardens were probably extended eastwards, as we read of them extending to the "Canal," which is what we know as the Long Water or the northern end of the Serpentine River. It is probable, therefore, that at this time (1714) some work had been done in the direction of the formation of the ornamental water out of the old Westbourne and its marshes and ponds.

It was, however, during the reigns of George I. and II. that Kensington Palace was at the height of such glory as belongs to it. George I. set William Kent, with his swelled-headed ideas of Art, to improve upon Wren, the result of which we see in the pompous suite of rooms in the north-central part of the main block, culminating in the Cube or Cupola Room, so called on account of its being nearly as high as it is wide and long. The north-west wing was erected by George II., chiefly for the accommodation of his growing family, but the influence of Caroline (Queen of George II.) was the most potent in respect to the expenditure of the Georges, as much as £100,000, it is stated, having been spent upon the gardens and Hyde Park. The Great Basin,

artificially confined, and the bottom cleared out and deepened, the resultant excavation being placed at the sides, as is perfectly evident as one walks along its banks on either side, but chiefly evident in the formation of the Great Dam at the lower or Knightsbridge end, having in its centre a weir, over which the water passes along 100 yards or so over its old course at probably its original level. The present arching and parapet at this weir are modern.

At the south end of this part of the Westbourne, between the Great Dam and Knightsbridge, there was formed, as is clearly shown by the records and by Roque's survey map, evidently as a part of this improvement scheme, a lower lake, 70 yards wide at its greatest part, and extending almost to Knightsbridge itself from the foot of the Great Dam, the New and Old King's Roads crossing it by bridges, and with a cascade or weir near its upper end, over which the water fell from the Serpentine outfall. At the Knightsbridge end it flowed through a short but narrow channel, and abutting on the bridge was a water wheel erected by the Chelsea Water Company, affording at flood times power enough to force or lift the overflow water as far as the Great Basin (in the Round Pond) in Kensington Gardens, which they had undertaken to keep supplied. This narrow channel was flanked by wooden and (latterly) dilapidated buildings, clearly shown by an old picture reproduced in

opposite the main or east front of the Palace, was constructed at this period, and a casual survey of the surrounding ground will show how, by depositing the excavated material from the basin on to the lower ground towards Kensington Road, the level was attained. We call this lake "The Round Pond," although in reality it is rectangular on plan, with shaped corners. George II. contracted with the Chelsea Water Company (then recently established for the purpose of supplying the rapidly developing district with water) to keep this basin filled at a price of £100 per annum and £50 additional for the supply of the Palace. This Water Company just after its foundation constructed a reservoir and pumping station in Hyde Park, near Grosvenor Gate, and the sunk garden with fountain still to be seen opposite the Mount Street entrance to the Park is the last relic of this enterprise. The eastern boundary of the gardens was extended considerably about this time, or a little earlier, and the sunk fence, or "Haw Haw," was constructed as we see it to-day, alongside the Ring Drive, from Victoria Gate as far southwards as the Serpentine Bridge, thus enclosing a piece of the new ornamental water. The chef d'œuvre, however, was the conversion of the Westbourne and its ponds into the noble stretch of water we know as the Serpentine River. The stream must have been temporarily diverted or

"London, Old and New," all of which, together with the lake, cascades, and bridges, were done away with in the alterations carried out to this part of the park about the middle of last century, and we now have some very sluggish water within a well-wooded enclosure of verdant grass with many trees, where you can see moorhens, herons, and rabbits disporting themselves. It is for all the world like some backwater of the Thames, miles away, while the stream (if it can be so denominated) terminates in a grated entrance to a drain culvert artfully hidden behind the bushes, and all this within a minute's walk of one of the busiest arteries of the West End Metropolis. A great deal of planting was done in the surrounding park, and it is recorded that many trees were removed and replaced, each requiring eighteen horses and sixty men to manipulate besides constant watering and attention for long afterwards. This work was completed in 1731, Charles Wither being the Surveyor-General of Woods in charge of the work during George I.'s time, and later Bridgman was responsible. Kent also had a hand, assisted by Capability Brown, and it must be freely admitted that the result is most admirable. It is recorded that two yachts were placed upon the lake for Queen Caroline's special benefit.

In 1834 the gardens were thrown open to the free use,

the inflow was naturally very filthy and unwholesome; thus the bed of the lake became largely a cesspool deposit, and for most part the water was stagnant, subject only to an arrangement made with the Chelsea Water Company to make good any evaporation loss by fresh supply from their mains. To remedy this an idea was put into force to pump the water from the lower end and discharge it at the upper, and some of the old pipes or troughs employed for this purpose are said to be still in existence along the north bank of the lake, though I have not been able to discover them. This was, as might have been expected, found useless, and the nuisance worsened until 1862, when a well was commenced at the Bayswater end, and a fresh and pure supply was soon obtained from the chalk, and there is still a pumping station there at the present day, which works the fountains at that end of the Long Water. The foulness of the bed, however, continued, and after considerable public agitation and a Parliamentary inquiry the water was wholly drained off, and, at a considerable outlay, 10 to 15 feet depth of foul mud was removed from the bottom, and a layer of gravel put down, the water depth being restricted to 5 feet at the Long Water and 14 feet at the lower end of the Ser-

Lambeth pottery of the seventeenth and eighteenth centuries, notably a bowl of 1737 inscribed "Drink Fair: Don't Swear." Entering Queen Anne's private Dining-room, we find the finishings intact, but differing in some slight details from those in the Queen's Gallery. It shows ingenuity in the treatment of the private entrance doorway, which is made to project into the room. There are here some very beautiful specimens of Battersea enamel ware of the latter part of the eighteenth century.

The next room was Queen Mary's Privy Chamber; here the wall panelling has disappeared, the dado only being left. The cornice is original, and of equal excellence to the others noticed, and there is the double monogram worked into its enrichment. Here more enamels arrested my attention, as did many interesting specimens of old watches and clocks.

Passing into Queen Caroline's Drawing-room, we come to the very inferior productions of William Kent, whose demerits I would not dwell upon beyond saying that the detail of every part is poor, proportion lacking, and the whole vulgar and pompous to a degree. The exhibits which attracted me here were the old tobacco pipes.

Although the official plan indicates the Cupola Room as the next to visit, we will take our own line, and inspect the King's Presence Chamber. Here we have Wren's dado, cornice, and fireplace, with Gibbons's carving; Kent came in and "improved" it with large window squares, clumsy doors, and a ceiling decoration of a distinctly Pompeian flavour. The Gibbons carvings to the overmantel were left alone, and are wonderful.

The King's, or Main, Staircase comes next. This was constructed by Wren, and it is a noble flight of Irish marble steps with wrought-iron balustrade of exceptional beauty of workmanship, even for such an artist as Jean Tijou. Kent added the heavy arcade and piers beneath the upper landing, and was responsible also for the wall paintings and the ceiling decoration. Kent may or may not have posed chiefly as an architect in his day, but at any rate his talents ran more in the decorative direction; and though his efforts in scene painting may not be of any superlative merit, yet the illusion he sets up is complete. Various persons notable in the Court entourage of his day are represented as looking over the gallery front at Royalty mounting the Grand Staircase. All these paintings are on canvas fixed to wall battens.

We now turn into the King's Gallery. This is the finest of the State rooms, and was erected in 1693 by Wren for William and Mary. Having formerly panelled walls, we have left now only the dado with an exceedingly beautiful cornice. It is thought that the panellings were removed by Queen Caroline to make more picture room. There is an extraordinary map and dial in the overmantel, on which, by a connection with a vane on the roof, a moving hand indicated the direction of the wind. This was erected by King William, but the moulding surrounding is said to be of later date by Kent, with the carved enrichments by pupils of Gibbons. The painted ceiling again is by Kent, and is gorgeous in effect. The former panelling, &c., of this beautiful room was covered over with white paint and gilding in 1725, and the following items were paid for the work:—

- | | |
|--|-----------|
| 1. For painting the wainscot, &c. | £ 32 16 0 |
| 2. For gilding the same | 154 4 0 |
| 3. For providing scaffolds for painters and covering the floors with boards to prevent damage thereto, &c. | 233 3 0 |

Can we take this as a typical surveyor's account in summary form, as presented to clients in that day? It seems likely that a good deal may have been represented by the "&c." in the last item.

Queen Victoria's Bedroom and Anteroom adjoining are the next in order, and are both very modernised apartments, interesting only from the fact that it was here that the young Princess was sleeping when awakened in the small hours of the morning of June 20, 1837, to be informed that she had then to assume the cares and responsibilities of the Throne which she so admirably sustained for a record period among our rulers of the past.

We next pass to the Nursery. This formed part of Kent's alteration, and is plain and undistinguished in character, interesting only by association from the fact that here our present Queen Mary was born in 1867. There are exhibited here some pictures of steam automobiles of the middle of last century and some lottery circulars of 1824.

The King's Drawing-room adjoining was one of the principal rooms in George I. and II.'s time, and is "Kentish" entirely. The ceiling is very heavy, with curious ceiling-painting bearing the "great" man's autograph upon it. From the windows of this room you look eastward across the basin and along the vista of the main avenue of the gardens.

It is a grand view, but not otherwise particularly pleasing; it is, however, difficult to imagine oneself within but a stone's throw of one of London's busiest quarters. There are several portraits hung here of the Georges and their family, by West.

The King's Privy Chamber adjoining is a kind of cul-de-sac. Here is an engraving of a picture by Kent, showing the marriage of George II.'s eldest daughter. Kent was a many-sided genius.

We now come to the last of the State apartments open to the public, and Kent's greatest triumph, viz. the Cupola Room, or Cube Room as it is sometimes called, although its height is considerably less than the length of its two sides. It is, like the rest of the work done at this time, pompous and vulgar, if gorgeous. To my eye, the architectural detail is very bad, and the pilasters, &c., ill-proportioned; the ceiling is very oddly painted to give the illusion of a dome, and the doorway porticoes are suggestive of an entrance to a mausoleum. Exhibited in this room are an old sedan chair, Hogarth's picture, Southwark Fair, and some very good silver exhibits.

Leaving the Palace, we must look at the Orangery, or Banqueting House, designed by Wren, and built under his supervision. It is a beautiful structure, undisturbed except for careful repair; there are the characteristic carvings over the alcoves at the east and west ends, and splendidly enriched cornices both inside and outside. Externally there is some beautiful gauged red brickwork, of the tone and colour apparently impossible to obtain at the present day, in pilasters and arches, the whole presenting a great field for study to the architectural student, whether professional or amateur. Several very interesting old lead cisterns—1663-1730—have been placed at intervals along the front terrace, while inside are specimens of the hansom and four-wheeler cab, and a knife-board omnibus, types rapidly becoming extinct.

The exhibits in the annexe are interesting, comprising some mediæval prison cells, dug-out canoes, the old Roman galley found on the New County Hall site at Pedlar's Acre, Westminster Bridge—the story of which the London County Council admirably set forth in a little pamphlet to be obtained of the attendants—all set up in tableau fashion, as nearly life-like as research and ingenuity can contrive. Opposite the south front of the Palace is a statue of King William III. of a very vigorous and virile type, presented to the nation by the present Kaiser of Germany. The old building at the south margin of the Palace green forming the old stables and mews is an interesting example of plain seventeenth-century work, well done and still sound and good. The dual monogram WM is to be seen on the rain-water pipes. It was probably built by Wren.

I am indebted to a historical guide to Kensington Palace by Ernest Law, B.A., for many of the statements contained in this paper.

FRENCH RENAISSANCE ARCHITECTURE.—III.

THE third of the ten public lectures on "French Renaissance Architecture," now being delivered on Thursday evenings at University College, Gower Street, W.C., by Mr. W. H. Ward, M.A. A.R.I.B.A., dealt particularly with "The School of Fontainebleau and the First French Architects: Henry II."

At the Renaissance secular building, Mr. Ward pointed out, takes a more prominent place than religious, for the Ages of Faith were passing into the Ages of Reason. In France, as in England and Spain, the pre-eminent force in national life was no longer the Church but the Royal power and Court. Such church building as occurred in the early sixteenth century was usually marked by fidelity to Gothic, though the churches of Saint-Eustache and Saint-Etienne-du-Mont in Paris indicate the process of translation to a new treatment. Among the most beautiful works of the early Renaissance in France are a number of tombs which, at first at any rate, were entirely executed in Italy, and therefore show almost pure Renaissance forms. An Italian family, the Giusti, settled in Tours and executed numerous sepulchral monuments of Carrara marble. French sculptors quickly became influenced by the fashionable fancy.

The "Style of Henry II." might, according to Mr. Ward, be more accurately described as the style of Catherine de Medici, his wife, for it almost exactly corresponded with the duration of her life in France, 1533-1589; whereas Henry only reigned from 1547 to 1559, and was not so conspicuous as his predecessor or successors in encouraging architecture. This new phase really began when Francis I. took up palace building with renewed ardour after his Italian campaigns. His favourite home was Fontainebleau,

which he transformed from an irregular and dilapidated fortified hunting lodge into a splendid, though still rambling, palace, enriched with the work of artists of all kinds and surrounded by delightful gardens. The history of the Advanced Renaissance in France is intimately bound up with these works. Mr. Ward therefore gave a rapid survey of the whole history of the palace until the building activity practically ceased in the reign of Henry IV.

The earlier Fontainebleau buildings seem to have been carried out by contractors—master-masons who worked under the King's personal instructions, possibly with the assistance of sketches made by Court painters. The results were not altogether very happy at first. But Francis quickly engaged decorators to come from Italy. These versatile artists at once began to exercise an influence on the architecture also. The new group of Italians belonged to the school whose lineage is traced from Brunelleschi, through Alberti and Bramante, to Raphael and Michel Angelo. The characteristics of their style were an abandonment of much of the exuberance and playfulness of some of the earlier work and an advance towards a more virile manner. The most important early representatives of this Roman School were Il Rosso, a pupil of Michel Angelo, and Primaticcio. Both were largely employed at Fontainebleau and had numerous assistants. Besides the groups of Italians at the palace and in various parts of France, an important influence was wielded by young Frenchmen who had visited Italy in order to study both the ancient monuments and the works of the most modern masters. Two at least, Jacques Androuet du Cerceau and Philibert de l'Orme, were in Rome soon after 1530. The latter in his writings expressed the greatest contempt for the examples of the Early Renaissance as exhibiting complete ignorance of the true principles of architecture. Two important mansions dating from about 1540 which show Advanced Renaissance ideas on an imposing scale are Ancy-le-Franc in Burgundy and Saint-Maur-les-Fossés near Paris, the former of which is still in perfect preservation.

In the year 1541 three Italians of note arrived; they were Serlio, Vignola, and Benvenuto. The two latter returned to Italy after a few months. Sebastian Serlio was appointed "painter and architect-in-ordinary in the matter of edifices at Fontainebleau" at a considerable salary. Apparently he acted in a consultative capacity both there and elsewhere, and he is spoken of with great respect in contemporary professional writings.

MANCHESTER SOCIETY OF ARCHITECTS.

At a meeting of this Society on October 24 Mr. Halsey Ricardo lectured on "Growth in Architecture."

In Professor Lethaby's little book on architecture, he said, there is that pregnant statement: "No art that is only one man deep is worth much. It should be a thousand men deep." It is much the fashion to accentuate the names of the architects of famous masterpieces and to regard them as the sole creators and originators of their work—to regard such men as Brunelleschi, Michel Angelo, and others as creative ends in themselves—as independent phenomena who individually affected and controlled the tendency of their time. Yet from another point of view we may look on them as resultants rather than causes. Their environment has produced them—not they their environment.

The stream of life is immortal, and the various mortal shapes in which it is manifested are the outward signs of its current, and owe their characteristics to the composition of the stream at the moment of their appearance. In our tributary of this stream the building instinct is immortal. Its manifestation at any period depends upon the ideals, the structural resources of the time. The dominant determining factor is the main stream of life. The history of the world is shown by its art with faithfulness exceeding all other record—with an eloquence unpremeditated by the craftsman.

This Mr. Ricardo then proceeded to show by a masterly view of the history of the arts, commencing with a contrast between the Assyrian bas-reliefs, with their tale of cruelty, strife, and oppression, and the Egyptian hieroglyphs, expressing their belief and hope in a future life, their delight in nature and animal life. Especially lucid was the account of the passing of mediævalism and the dawn of the Renaissance—the lecturer emphasising the growing tendency of the craftsman of the Middle Ages to perfect his own craft, giving it individualistic excellence, losing his view of the whole work, and the characteristic of the mediæval genius.

The emergence of the specialist paved the way for the

revival of learning. Coming to modern times, Mr. Ricardo maintained that the impress of our social, religious, and public life on any example of our work is greater than that of the individual architect who designs it. The buildings of our age express its temper; and posterity will look back upon our present period as one of high endeavour, even if we have failed in high endeavour.

SKETCHES BY THE LATE PHIL MAY.

THE Leicester Galleries, so generous in the provision of interesting collections of works of Art, have yet another in that formed by Mr. L. J. Drew, evidently an admirer of the late Phil May. Even if the present Art Critic is not to be classed amongst similar admirers, it may be conceded that a school of devotees of this artist is quite comprehensible.

Indeed, this same Art Critic, often unwillingly, is bound to admit the merits of much of Mr. May's work; nor is this reluctance in any way the result of prejudice. It results rather from the sense that, clever and dashing as the work may be, it is not Art of the level to which du Maurier, Tenniel, Keene, Bernard Partridge, and H. Furniss have accustomed the public. The above selection is of set purpose restricted to "Punch" illustrators. Is this idiosyncratic on the Art Critic's part? Surely not; but rather it is based on more truly critical grounds than are often taken.

It has been stated respecting Phil May that he was accustomed to work up his sketches elaborately and then gradually to eliminate all superfluous lines. True or not (and we doubt its accuracy), he was marvellously facile at expressing in the fewest strokes the greatest effects. Sometimes when he elaborated, his hatched lines assumed curious positions, failing to express horizontality here and some other quality elsewhere, such as were obviously necessary for expression. And a limitation of the artist's was that he seemed able to portray only common types of humanity, more often than otherwise the East End metropolitan type. Indeed, of all the sketches of young ladies shown in the exhibition there are but two passably presentable in facial treatment, and one of these (No. 93) is indeed piquant to an extent and noways reminiscent of Whitechapel.

His best work lies in portrait sketches, such as those of "Mr. John Burns," "Mr. Odell," "The Old Sergeant—Montreuil," and "An American Model"; to these may be added the fancy portrait sketches, such as "Songs and their Singers," "Le Sportsman," "The Widow" (No. 78), and a sketch of a man on a locker (No. 69). The "double-faced" portrait of Mr. Kruger is good, regarded as a caricature. But in many of the drawings the chief humour (or it would be better to say the chief merit) lies in the accompanying text.

Some of the "crowd" sketches are admirable, with their "scale" and their perspectivity; in fact, in his more diminutive work Mr. May is invariably satisfactory, as in the 'Arry series. A few of the "Punch" sketches illustrating particular conversations, such as Nos. 7, 32, 62, and 86, are very good indeed, and this is the effect obtained by a sweeping glance cast over the whole exhibition.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE Board of Architectural Education of the Royal Institute of British Architects announce that the designs submitted by the following students who are qualifying for the Final Examination have been approved:—

Subject IV.—Design for a Senate House for a Modern University.—Mr. E. F. Bothwell, Mr. A. D. Clare, Mr. H. A. Dod, Mr. R. Duckett, Mr. E. Gee, Mr. E. H. Gibson, Mr. K. Glover, and Mr. E. Prestwich.

COMPETITION NEWS.

DONCASTER.—The designs of Mr. Maurice Thompson, of Doncaster, have been accepted for the erection of the new wing for the Yorkshire Institution for the Deaf, at Doncaster. It is estimated that the proposed new building will cost from £3,000 to £4,000. The premium offered was £50, to be merged in the commission.

HALE.—The Town-Planning Committee of the Hale (Cheshire) Urban District Council, with their adviser, Mr. Percy D. Lodge, Lic.R.I.B.A., of Manchester, have made the awards for competitive schemes for laying out the unbuilt-upon portion of the district under the Town Planning Act, 1909. The first premium of £50 goes to Mr. R. Dann, of Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, Sussex; and the second premium of £25 to Messrs. Robert Bennett, A.R.I.B.A., and Wilson Bidwell, architects, Letchworth (Garden City), Herts.

INTERIOR DECORATION.—III.

By ALBERT E. BULLOCK, A.R.I.B.A.

GREAT BRITAIN.—III.

HOUSE OF HANOVER—THE GEORGIAN ERA.

(Continued from last week.)

THE decorations at Houghton constitute the *tour de force* of Kent, who was at the time in great vogue as an authority in matters of taste. Two of the craftsmen engaged were subsequently employed by Gibbs: they are the Italian Artari and the Dutch sculptor Rysbrack. The ceiling of the Stone Hall is the work of the former artist, while the pediments over the door openings are crowned with boys in various attitudes, from the chisel of Rysbrack. Houghton is the first English residence where Cuban mahogany was extensively employed. Hitherto the wood had been confined to furniture and marquetry work; its expense was still prohibitive except to those who possessed a gold-lined purse of unfailing supply. The staircase at Houghton was formed by Kent upon the Coleshill model, and its walls were decorated with chiaroscuro, in which Kent excelled. The furniture is in Kent's usual heavy style, with much carved ornament, with which it is interesting to compare the work of the closing years of the century by Sheraton, Heppelwhite, and the designs of the Brothers Adam. All the bold heaviness is purged from the later works, which strive after a delicacy almost approaching effeminacy.

The saloon is exceptionally sumptuous. Entering through a much carved and gilded doorway, the rich silk brocade lining the walls above the white dado is particularly striking, although it is the only connecting link with the coved, painted and modillioned ceiling. The ornamented entablature contains a frieze emblematic of the hunting field, with dogs, bows and arrows, &c., repeating at intervals. The marble chimneypiece is a very neat design in white and dark green marble, and compares favourably with the other rooms. The scheme of the Banqueting Hall, or "Marble Parlour," as it is called, is very bold. Only one side is in marble, with dark fluted columns having white bases and capitals of the Roman Ionic order. The chimneypiece is a fine composition, executed with remarkable skill. In the central panel Rysbrack has carved a bas-relief representing a Sacrifice to Bacchus. Grapes naturally figure prominently in the ornamentation of the room. The ceiling frieze is composed of them, while the soffites of the beams are carved with a running vine pattern. The White Drawing-room presents one of the best decorative schemes, although of two distinct periods. The narrow panels are filled with a light French silk tapestry, after the manner of Berain's designs, and thereby tend to lighten the effect of the otherwise heavy ceiling. The furniture is upholstered in keeping with the tapestry panels. "Plans and Elevations of Houghton," by Ripley, Kent and Ware, was published in 1755.

Wolterton is not so large nor yet as sumptuously finished as Houghton, and is for that reason a better example from which to study the treatment of the smaller mansion of the time. There is no lavish expenditure. It is just a typical early Georgian house of good design. The façade is of small red bricks with stone dressings to the windows, having stone also to the terrace arches, balustrading, pediment and cornice. Within the same simplicity is noticeable, the combined efforts of Kent and Ripley having produced a more restrained and tasteful essay than was usual. There is an absence of pediments, the door and window cornices being quite plain. The wrought-iron balustrading, the unpanelled dado, the simple chimneypieces of grey and white marble each indicate the discretion of their design or selection. The ceiling of the saloon is, perhaps, the most curious feature, since it has a subsidiary moulding above the modillioned cornice, into which the beams intersect at regular intervals, and on their soffites is modelled a Greek fret of unusual pattern, of which a replica existed not so long since in a house at Westminster, said to have been inhabited by Lord North.

Hursley Park, Hampshire, is one of the larger mansions rebuilt in Georgian times, within which are rooms decorated at different periods. The woodwork and ceiling in the boudoir, for instance, are of Jacobean origin; the fine carvings in the hall are adapted from the late seventeenth-century panelling that formerly adorned Winchester College; the drawing-room is a fine Georgian interior, and the ball-room is decorated in Louis XV. style. The panelling from Winchester College is a recent addition by the present owner, Sir George Cooper. The panels and stiles contain some fine carvings, the chief motif of which is the bay leaf, the emblem also of the frieze. The room which principally concerns us

is the drawing-room, since it is one of the original rooms and not an adaptation. It is divided into two parts by a large beam supported upon Ionic columns, similar columns adorning the walls and flanking the windows. Ornament is disposed sparingly, and the marble chimneypiece is surmounted by an overmantel of the type designed by Kent; otherwise the general character is such as might reasonably be attributed to Gibbs. The plaster work is free from the extravagances Kent was wont to display, the general tone of white and gold being very effective. Tapestries by Francis Boucher line the walls of the ball-room, with which the remaining decorations are in keeping. The general treatment is not unlike the work of Van Cleve at the *Œil de Bœuf*, Versailles, especially as regards the ceiling. Boucher worked a great deal with Verberck, succeeding Oudry in the management of the Gobelins in 1755. Oudry superintended the works at Beauvais. These additions were probably made after the death of Boucher in 1770.

Lord Burlington's villa at Chiswick was commenced in 1729. Henry Flitcroft came under the Earl's notice while working as a carpenter on one of his buildings, and was subsequently employed as a draughtsman upon Kent's edition of "Inigo Jones." Kent's work at Chiswick House is shown in the two accompanying views taken by Mr. Walter Spiers. The ornaments of the chimneypiece are unnecessarily florid, the treatment of the mantel itself being typically Kent. The recess in the second photograph is more restrained, if the ceiling is a little less so. The great rotunda under the central dome received his special attention, and there is, I believe, an original design of Kent's for this in the collection at South Kensington. Flitcroft, nicknamed "Burlington Harry," the son of Jeffery Flitcroft, who was gardener to William III. at Hampton Court Palace, eventually succeeded Kent as master mason and Ripley as Comptroller of the King's works. His principal productions were the churches of St. Giles-in-the-Fields (1731-34); St. Olave, Tooley Street; St. John's, Hampstead, and the rebuilding of Wimpole Church, Cambridge. He made alterations to Wentworth Woodhouse, Yorkshire, for the Marquis of Rockingham, and to Woburn Abbey for the Duke of Bedford.

Holkham, Norfolk, is built on the severer lines of the Palladian principles adopted by Richard Boyle, the Earl of Burlington, for his Chiswick villa, but upon a grander scale. The triple light windows are of the character which formed a favourite feature with Sir Robert Taylor later in the century, when he was architect to the Bank of England. The Ionic pillared hall differed from anything which preceded it, and is of severe Classic design, except for the freedom of the sculptured frieze and heavy ceiling beams. The fluted alabaster columns are raised on a podium forming a gallery, to give access to the principal rooms on the first floor. Thomas Coke, Lord Lovel, and afterwards the Earl of Leicester, commenced the house in 1734. His great-grandfather, Sir Edward Coke, the Lord Chief Justice during the reign of Charles I., died in 1634 at Stoke Poges, Buckinghamshire, possessed of sixty manors. He acquired valuable manuscripts, which now form part of the present library. His monument in Tittleshall Church, Norfolk, was erected in 1638 by Nicholas Stone. Thomas Coke had travelled much in his early years, returning from Rome in 1718. He consulted Lord Burlington upon the subject of his projected residence after the greater portion of the surrounding ground had been laid out and planted. William Kent was employed on the designs, probably paying his last visit to Italy in 1730 for the purpose of studying afresh Palladio's work at Vicenza. It is said that Antoine Desgodetz's "Edifices Antiques de Rome," published in Paris in 1682, was consulted for much of the interior of Holkham. To its influence the coffered cove of the hall may be attributed, together with the ceiling of the saloon. The Temple of Fortuna Virilis provided a model for the hall colonnade, while the ceilings and chimneypieces are the result of the study of the works of Inigo Jones. This great building was not completed when Kent was interred at Chiswick Church in 1748, nor when the owner died in 1759. Kent's labours were carried to completion by Matthew Brettingham, the architect of Langley Park, Norfolk, who was permitted by Lady Leicester to publish the "Plans and Elevations of Holkham," which appeared in 1761. Eight years later the elder Brettingham died, and his nephew Robert republished the volume, with additional illustrations of chimneypieces, ceilings, and letterpress. In this edition Kent's authorship of much of the work is acknowledged while the names of Inigo Jones and Antoine Desgodetz accompany other details.

The chimneypieces vary considerably in design, those in the saloon and library having Ionic columns, of which the shafts are dark grey. The shelf to the drawing-room mantel

is supported on carved brackets; that in the Green State-room has caryatid angle pilasters; and the Claude room probably contains the most interesting example, obviously from Kent's design, with his favourite husk ornament, with heads and drapery treated in a manner frequently adopted by Webb. White and gold are the primary finishings to the ceilings, dados and door casings throughout, all the carved work being picked out with gilding. The library was probably completed by Brettingham, the vaulted cove to the ceiling being in the French manner. Tapestries line the walls of the Green State-room and the North State bedroom.

Nostell Priory, Yorkshire, was begun within a year of the commencement of Holkham, for Sir Rowland Winn, by James Paine, at the early age of nineteen, being enlarged

want of connection between its several parts. The frieze design is a running scroll of Classic detail, with heads modelled at intervals. The tapestries here are of great value, and are hung in a very successful manner, especially on the north and south sides, where they are "made up" with long panels painted with flowers to fill the excess of space next the doors on the east and west walls. The library and entrance hall are Adam *in extremis*. The library is well arranged, with its pedimented book cases and arabesque Ionic pilasters at intervals, but the hall, having no painted panels to relieve the general tone by way of contrast, presents an artificial aspect which is less satisfactory. Robert Adam records works here in 1776 and 1779, in which latter year he designed a gateway for the residence.

Wentworth Woodhouse, Yorkshire, is one of the principal

KENT'S WORK AT CHISWICK HOUSE.

later in the century by the sixth baronet upon the advice of Robert Adam. There is very little of the interior decoration free from this later style, even the dining-room—one of the original rooms of Paine's building—having been added to. The fireplace overmantel, doors and picture frames, with the cornice and frieze, savour of the original work; the ceiling itself is of French influence, and the available wall spaces are occupied by panels filled with Adam arabesques. The small circular pictures over the door heads are in the style of Angelica Kauffmann, of whom we shall have something to say later. The drawing-room is completely by Adam. The ceiling here is arabesqued, with a pattern of meeting semicircles having plaques of Wedgwood pattern with modelled figures upon a heliotrope ground. The frieze is a monotonous repetition of delicate spirals. The ceiling of the saloon is of rather more interest, but suffers from a

English mansions of the eighteenth century. It stands in a park nearly as large as Blenheim, and, like many another seat, contains its special treasure, the Whistle Jacket picture. The Diana of Holkham, the tapestries of Blenheim and Hursley, and Watson's carvings at Chatsworth are cases in point.

The greater portion of Wentworth Woodhouse dates from the time of Kent's latter years, as many of the interior details testify, although much of the older house was incorporated. Thomas Watson-Wentworth, Marquis of Rockingham, employed Henry Flitcroft as his architect, who was at the time engaged in building St. John's Church, Hampstead, and Woburn Abbey for the Duke of Bedford. The upper storey and wings were added in 1806 by Carr, of York, when past his eightieth year during the time of the occupation of the house by Earl Fitzwilliam. There

is little doubt that Kent assisted Flitcroft in the interior; the frieze over the gallery in the saloon is decorated with a variation of the famous Inigo Jones female head with festoons; the chimneypieces in the "Vandyke" room and the painted room both savour of Kent's system of design, while the panels and friezes of the dining-room and the "Whistle Jacket" room are of Régence influence. The ceilings are for the most part based upon Classic detail, with some freedom as regards the soffite panels of the example in the last-mentioned room, which has, by way of colour scheme, the white and gold treatment originally adopted by Inigo Jones.

Another assistant in the preparation of Kent's book on "The Designs of Inigo Jones" appears in the person of Isaac Ware, who was a skilled draughtsman and engraver. His career was not dissimilar to that of Flitcroft, whom

House, South Audley Street, for Philip Dormer Stanhope, adapting some materials from Canons, the seat of the Duke of Chandos. He similarly adapted materials from Lord Chesterfield's old house into one he built for himself at Westbourne Place, Harrow Road, which subsequently became the residence of Samuel Pepys Cockerell.

The Radcliffe Library, Oxford, was the outcome of a bequest by John Radcliffe, M.D., who died in 1714, but the building was not commenced until a much later date, being eventually completed by James Gibbs in 1747, who in that year published a monograph with complete drawings of this work, in which he mentions the names of the various artificers who assisted in the building. The masons were William Townsend of Oxford and William Smith of Warwick; the others include John Philipps, carpenter and joiner; George Devall, plumber; Townsend, junior, stone

KENT'S WORK AT CHISWICK HOUSE.

he superseded as clerk of works to His Majesty's Palace. If one may judge from the records left, his clientèle was even more extensive, which was doubtless due to his many publications and the popularity of his book, "The Complete Body of Architecture," which first appeared in 1735 and ran to two further editions during his lifetime. He occupied the position of clerk of works to the Tower of London, Windsor Castle, and the Board of Works. He took the place of Hawksmoor as draughtsman to the Boards at Windsor and Greenwich. After Kent's decease Ware completed the Horse Guards; made alterations to several buildings in Lincoln's Inn Fields; converted Lanesborough House into St. George's Hospital; completed Chesterfield

carver; Linel, of Long Acre, woodcarver; the Italian, Artari, plasterer "in the fretwork way"; Blockley, locksmith; and Michael Rysbrack, sculptor, "to cut the Doctor's Figure in Marble." The detail, although somewhat severe and academic, presents that scholarly quality which has always been associated with the name of the architect.

The second half of the century was ushered in with the publication of numerous books on ornament, joinery, ironwork, and Edwards and Darly's "Chinese Designs," which appeared in 1754 concurrently with T. Chippendale's "Gentleman and Cabinet Maker's Directory."

The chief practising architects of this period include Matthew and Robert Brettingham, John Adam, of Edin-

burgh, Robert and James Adam, Sir William Chambers, John Carr of York, Sir Robert Taylor, James Essex, James Stuart, Nicholas Revett, Henry Holland, George Dance, Joseph Bonomi, Thomas Leverton, James Wyatt, John Nash, and Sir John Soane.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

A COMBINED ordinary general meeting of the Architectural Association and a meeting of the Camera, Sketch and Debate Club was held at Tufton Street, Westminster, S.W., on Monday last. Mr. Gerald C. Horsley, president, occupied the chair.

Three nominations for membership were read.

It was announced that the Annual Conversazione will be held at 18 Tufton Street on Thursday, November 21, at 8 p.m. It was also announced that the next meeting of the Camera, Sketch and Debate Club will be held on November 7 at 8 p.m. (Novices' Night), when papers will be read by Messrs. H. Bart Tunnard and H. E. Moss. Arrangements have been made for a visit to be paid to the Wesleyan Church House on November 16 (Saturday).

The President then read the names of forty-three gentlemen who were duly elected members of the Architectural Association. He also announced that Mr. W. G. Newton had been nominated to fill the vacant Hon. Librarianship, and that Mr. H. M. Fletcher was nominated for the vacant seat on the Council.

Mr. Arthur Keen, Hon. Treasurer, formally moved the adoption of the Council's report and balance-sheet for the session 1911-12, as given in the Brown Book.

This was seconded by Mr. W. Curtis Green, vice-president, and was carried without discussion.

Mr. Lawrence Weaver then gave his illustrated lecture on

Small Country Houses of To-Day.

His presence there was, he said, due to an invitation which their President had extended to him at the close of his address last session on Scottish Houses. While he felt much flattered at being called upon to speak so soon again, he wanted to guard against any misconception as to the way in which he proposed to treat the subject of "Small Country Houses of To-day." He particularly hoped that nobody would think he was there to instruct architects about their own business, still less to advance any theories as to the course that the design of small country houses ought to take, or is likely to take. Like the character in that admirable comedy, "The Liars," he might be an ass, but he was not a silly ass. It was natural enough he should have views of his own about the various streams of tendency in modern design. Perhaps he might be allowed to say that he did not think the sun of architecture first rose on Regent's Park, and that he was unable to agree that Wren was a foolish old person, whose chief function was to pave the way for the final glories of Soane and Nash. That, however, was by the way. His present business in life was to act the part of showman; to make clear to the public through the pages of *Country Life* how excellent and how varied is the work which the architects of to-day are doing, and to dispel as far as may be some of the fog of misapprehension which clouds the mind of people who are proposing to build. He endeavoured—no doubt very feebly, but quite sincerely—to make people understand that the building of their houses is the one branch of modern art in which they are most concerned. He conceived it his duty to show as many widely different types of houses as can fairly be said to represent an honest and unaffected outlook on the problem of fitting suitable houses to widely-differing needs and personalities. In the pursuit of that idea he had necessarily to show houses which to some people might seem either poor or positively bad; but he could claim that he had never written with appreciation about a house which did not seem to him to have some definitely good point, either in its planning or in its treatment, or that did not serve as a text which enabled him to explain how difficult are the problems besetting the architect. It was in the spirit of a showman he was going to put on the screen a series of houses, chosen almost at haphazard from the large number he had seen and described. Having very rarely written about a house without first seeing it, he had had the peculiar advantage of learning from clients what

they think about their houses, and about the ways of architects.

Mr. Weaver began with one or two houses by Mr. Norman Shaw and Philip Webb. He considered that the great structure of modern architecture has been very largely built on the foundations which they laid, though he would not exclude from that pioneer work such honoured names as Eden Nesfield, George Devey, and others. The first house to be illustrated was that designed by Philip Webb in 1859 for William Morris; the plan of "The Red House" was an extraordinarily bad one, though this was probably due to the idiosyncrasies of the owner who desired sunless rooms to sit in. "Coneyhurst" was designed by Webb towards the end of his career as an architect, and, while it does not reveal much development in plan, it is more regular than the other.

The remaining houses illustrated were roughly divided into four groups. First there was the traditional or cottage type which specially concerned itself with the local manner. Next came the houses which more or less took their form from their material. Then followed the houses showing direct historical influence and foreign influence. The final division was restorations.

Mr. C. H. B. Quennell, in proposing a vote of thanks, remarked that Mr. Weaver had been a very kindly critic. The instructive part of the paper was in seeing so much modern work in bulk. One could not help feeling that there had been no marked improvement since the days when Lethaby had designed his houses twenty years ago. Architects were still tied up with tradition; the best part now seemed to be the plan. The rooms were so disposed that each gets its allowance of sun, and the details of service are usually well considered. But apart from those qualities one found everything else almost as it was before the twentieth century. Let them assume that a client looks at his house in much the same way as he looks at his motor-car, and they would realise how architects would appear to have stopped still. Personally he could not help thinking that architects ought to try and consider a house as much as they could in its relation to modern methods of construction. One inconsistency was having 14-in. walls with a trumpery roof upon it. The plans of present-day houses were good; but when one comes to regard the elevations the excellence seems to break down. He would have liked Mr. Weaver to slang architects more. Another thing which worried him a little was in connection with the very practical side of cooking and heating. In an ordinary small country house there were probably used in the kitchen about fifteen tons of coal per annum. He wished some engineer would calculate how many foot-pounds of power there are in a ton of coal. Our present methods of cooking and heating are extraordinarily extravagant. Most houses are equipped with a kitchen-range which seemed hopelessly bad. In the course of the next twenty years they ought with the same amount of coal to heat their houses as well as do their cooking. With regard to the interiors, he might mention that the owner of a house who drives up in a Rolls-Royce car has, when he gets indoors, to sit on a chair made for a man in armour. He believed that architects needed to be much more practical and look at the problems from the engineering point-of-view. They should study hygiene, and not bother so much about the "wheezes." The nation was still abominably housed. Professor Reilly had contended, with probable truth, that the problem would be solved by a much more simple arrangement of the plan.

Mr. G. H. Jenkins said he could not agree that it was just as well to be frightfully practical and to forget to be artistic. It seemed to him that the houses one saw now were better than those designed before. He would like to have heard Mr. Weaver's ideas on the subject of the number of bathrooms desirable; people seemed to be nearing the time when they would require a bathroom, or at least a fitted lavatory, for every bedroom. The provision of an open loggia was an excellent idea if it was only open on one side and faced south, as then the family could have their breakfast in the open all the year round, with the exception of the four winter months. Mr. Quennell had mentioned the heating of houses. Nowadays it was easy to instal heating systems with their 3-in. pipes hidden behind the skirting. It was then possible to cut down the coal bill, as no one needed a fire except for appearance sake. It seemed a very moot point whether or not it was better to have the hot water supplied by a separate heater to the kitchen range. Where the hall served also as a living-room it was a great advantage to allow the servant to have direct

access to the front entrance door without passing through the hall.

Mr. A. T. Bolton remarked that the whole question resolved itself into trying to find a compromise between the ideas of the client and those of the architect. A house could not be properly judged without some idea of the special uses for which it was erected. A very modern house resembles a battleship, and the public cannot understand that if it possesses certain qualities and certain features it is practically impossible to also give it other features and qualities. There is always a risk that in gratifying the wishes of the client a house may become a hideous medley because of the impossibility of reconciling the various requirements. Mr. Weaver had mentioned the large number of small country houses erected in the Birmingham district. In the Midlands the same class of man who in the South buys a house there builds one for himself. He can acquire a site very readily, and there he erects a house ranging from £1,000 to £3,000. These are strict commercial propositions, inasmuch as for a given sum of money they provide certain accommodation, and when the architect is skilful the results are successful. Nowadays, unfortunately, the general public made architects responsible for the things they have never done. The jerry-builders' work is credited to the profession, although really architects have had nothing to do with it at all. The number of small houses around London erected from architects' designs is very small indeed.

Mr. T. L. Dale confessed that he felt very much in sympathy with Mr. Quennell's view in wishing architects of the present day could evolve something more characteristic of themselves than they had done hitherto. He felt that a development might be made in the direction of hygiene, though by this he did not mean they should design their houses like hospitals. The existing desire for antiques is a very great hindrance to an architect. If Mr. Weaver could induce people to look on a house as they looked on a motor-car it might help the profession to arrive at something fresh and distinctive.

Mr. Arthur Keen mentioned that Montacute was an instance of a house with a large hall running from back to front. This was obviously an inconvenient arrangement, and one of the owners bought the front of a house in the neighbourhood and re-erected it as an inside partition across his own hall. After looking at the photographs shown that evening, he could not help feeling it was a pity architects could not arrive at some standard of design. There was an affectation about most of the houses which was distressing. The present position was illustrated in the career of Mr. Norman Shaw, who designed and planned in every conceivable style without attaining anything fixed at the end. Philip Webb, however, was consistent throughout his long life. It seemed to him impossible that they would arrive at any recognised method of designing. The client was certainly as much at fault as the architect in the existing over-elaboration. A client becomes anxious to have a house or a room something like what he sees illustrated in the papers, the result being that the architect is pushed into doing something he does not approve of. The views had suggested what a very valuable thing scale was in domestic work. In the examples of the Birmingham School that quality was present in an extremely fine degree.

Mr. Cecil Brewer thought that a man who built his own house required more individuality in it than he would expect to have in his motor-car, which was to be put on one side probably at the end of three years. Mr. Weaver had been remarkably mild in his criticisms; perhaps it was impossible for a man to be a real critic unless he belongs to the trade criticised. An architect would probably have been much harsher.

Mr. G. C. Horsley then put the vote of thanks to the meeting, and it was carried with acclamation.

Mr. Lawrence Weaver, in replying to some of the points raised, remarked that, in connection with the advocacy of the use of modern methods of construction, they had to bear in mind that there were such things as by-laws. With regard to the leniency of his criticisms, he might say that he regarded himself as something in the way of a commercial traveller, and consequently he tried to boost up his wares. There were abroad various prejudices against architects as being faddists, unpractical, and possessing various evil qualities. Indeed, it seemed to him that there was more than enough readiness to find fault with the profession, and not enough appreciation. As to discovering the perfect kitchen-range, personally he thought that that might best be left to the owners of foundries. He quite agreed as to the heaviness of the trail of Wardour Street. It did not

seem as if they could have any standard of design, because architects had to meet the differing views of the millions of people in this country. Philip Webb was consistent because of his high-handed ways; he would tell a client who would not let him do just as he wanted to go away. The influence of the architect was solely a question of personality.

NOTTINGHAM ARCHITECTURAL SOCIETY.

THE opening meeting of the winter session was held at the Society's room on Wednesday, October 23.

There was a capital attendance when the President, Mr. Ernest R. Sutton, F.R.I.B.A. and member of the Council of the Royal Institute, delivered the following Presidential address:—

Brother Architects and Brother Students.—Allow me to embrace the earliest opportunity of tendering my thanks for the honour you have done me in electing me your President. I need scarcely say how greatly I appreciate the compliment, and that it will be my constant aim and endeavour to uphold the traditions and dignity of this important office.

This would also appear a suitable occasion on which to remind you of the distinctions gained by members of our Society and Nottingham men. For instance, Mr. A. W. Brewill has been appointed to serve upon the Council of the R.I.B.A., in addition to being a member of some of the most important administrative bodies, including the Registration Committee; Mr. T. H. Whittaker now occupies the post of chief architectural assistant to the county of Hereford; and Mr. Robert Atkinson has been selected to compete in some of the principal competitions of the year. I hope before long we may congratulate him on securing premier honours in one of these big undertakings.

Then it is a source of gratification to know that amongst the exhibits in the Royal Academy Mr. Arnesby Browne's great work, "A Norfolk Landscape," was universally conceded to be "the finest picture of the year," whilst in the architectural room of the institution Mr. Charles Gascayne and Mr. Robert Atkinson, both Nottingham representatives, had more of their works hung than any other two men.

It is also worthy of notice that this year every officer of our Society is a member of the R.I.B.A.

I think you will agree that this forms a most creditable and encouraging record of honours.

Before proceeding further I must touch one note of sadness. I am confident I am voicing the feeling of the members when I say with what keen regret we learned that our City Architect had been compelled to relinquish his office owing to continued ill-health. I would suggest an official letter be forwarded from this Society to Mr. Lewis expressing our sympathy and earnest hope that he will be speedily restored to health.

It is my privilege and pleasure this evening to address you on topics of interest to the profession, but the subjects which occur to me are so varied that I find it difficult to make a selection. A few details of the programme arranged by the Council for the coming session may prove acceptable. You will notice we have changed the evening for our meetings from Tuesday to Wednesday. I hope this arrangement will not be found inconvenient to our members. You will, I am sure, realise that it is most difficult to fix an evening that is equally convenient to all. Our reason for the alteration is that the School of Art and University College conduct important classes on Tuesday nights, and it was thought desirable to hold our meetings on Wednesdays so that the students at the classes should also have the opportunity of attending our gatherings. The designing class is to be continued this session, but on rather different lines. The Council hope that this class will be better supported than in the past.

The Council have been in communication with the University and School of Art authorities on the question of establishing classes embracing the subjects included in the Intermediate and Final examinations of the R.I.B.A. It is most gratifying to be able to report that these classes have been instituted, and it is hoped that the students will show their appreciation of the steps taken by the Council by attending the classes, which should be of great assistance to those preparing for the Institute examinations. I hope that ere long all architectural classes for students throughout the country will be linked up with our University centres and the R.I.B.A. I have not the slightest hesitation in stating that every architectural student should make it his first duty to pass the R.I. examination and become a qualified architect.

The Council have instituted a special Committee to undertake all matters connected with the Town Planning Act. I am glad to know that Mr. A. W. Shelton has consented to join this Committee, and I can assure him he will receive a hearty welcome. It is hardly necessary to remind you that Mr. Shelton has devoted a very considerable amount of time, energy, and money in studying the subject, and he is recognised as an authority both at home and abroad.

It is proposed that the Committee shall get in touch with all local authorities at an early stage and before they have actually prepared the completed scheme, in order that suggestions can be most effectively made both in regard to the planning and regulations comprised in the scheme.

We are constantly hearing of the boom in trade in different parts of the country, but I am sorry to say I have been unable to discover any signs of the boom having reached our City; the building trade is still in a depressed condition.

There are no capital and labour difficulties to draw your attention to at the moment; there is, however, a question that will, I believe, have to be considered by us in the near future—that is, our position with regard to the contractors adding 10 per cent. on all provisional items irrespective of the amount or class of work. In many cases this amount appears to be excessive, and more especially when the contractor does not add anything for his own services in connection with his sub-contractors. Let me just give you an illustration. You have a block of warehouses. The heating or electric lighting amounts to, say, £500. If we include this in the quantities the client will have to pay an additional 10 per cent. of £50. If it is kept out of the builder's contract our client will have certainly the trouble of drawing two cheques, but he will be £50 in pocket, less the penny stamp for the cheque. Now, what is our position? If we are instructed by our clients to omit all provisional items and treat them as separate contracts, has the builder any grounds for complaint? On the other hand, if we don't explain the 10 per cent. commission what is our position with regard to our client?

I should be neglecting my duty as your President were I not to make some reference to the finest improvement scheme undertaken by the Corporation for many years, the widening and rebuilding of Carrington Street.

The inability to successfully manage our street architecture appears to be almost a national weakness when one considers the prominent examples we have before us; look, for instance, at the Regent Street rebuilding scheme, the "Piccadilly blunder," and again the collection of promiscuous buildings in Kingsway. Now with regard to Carrington Street—I hope I am not getting on thin ice, but it is foolish to ignore the lessons which past mistakes have taught us. The initial mistake was sacrificing too much to the individual shopkeeper. The architect should have been given a free hand to design a façade of a monumental character and worthy of one of the finest streets in the City, and not be hampered by the hundred-and-one special requirements of a vast number of tradesmen carrying on different trades. It is not very difficult for us to realise what a magnificent street our ex-President would have given us if he had been allowed to carry out the whole of the buildings on somewhat similar lines to the very successful Carrara terra-cotta edifice façade. The opportunity of obtaining a grand approach to our City, flanked on either side by buildings worthy of such a position, has now, unfortunately, been lost.

I am introducing the subject of competitions this evening with the object of raising a discussion on the question. I am of opinion that we should use every endeavour to limit the number of competitors in all cases. In almost all open competitions the competitors expend collectively in the preparation of their designs a sum far exceeding the fees that the successful architect receives for the whole of his services. This is a very expensive luxury for the profession to be saddled with and one which we can ill afford to keep up. I cannot see how the cost of preparing competition drawings is to be reduced. You must, if you are to stand a chance of success, work out your scheme in every detail, and the draughtsmanship must be of a high order.

The conditions as revised by the R.I.B.A. Competition Committee are much improved; but I should like to suggest a further improvement—that the responsibility of nominating an assessor shall be in the hands of the Committee, and that the assessor shall be an architect who has either specialised or is an acknowledged authority on the particular subject.

There was a question raised at the last Council meeting of the R.I.B.A. which is of some interest. A limited

competition was instituted in Scotland (Edinburgh, I think), and the Edinburgh Society of Architects warned their members not to compete because the conditions were not considered fair. One of the architects wrote the Secretary of the R.I.B.A. asking if the rules of the Institute precluded him from competing, and the Secretary advised him that the Institute conditions did not apply.

I should like to refer again for a moment to the Royal Academy Exhibition. I think we have a real grievance here with regard to the amount of accommodation allocated for the exhibition of architectural drawings, though I can quite imagine the authorities replying: "It is the least popular room in the exhibition, except with the dear old lady who just pops in to have a quiet little snooze." This, I must reluctantly admit, is the case, and I regret to say it is in a great measure due to our own action. If we wish the general public to take an interest in the work exhibited in this much neglected room, we must supply drawings that have some interest to "the man in the street"; and I would advocate that in all cases the drawings should be of buildings which have been recently erected or are in course of erection. Many of the drawings which find a place on the walls are of buildings which are not, and never will be, in existence; rejected competition drawings and fancy pictures culled from the highly imaginative brain of the artist.

The question of registration is bound to be much in evidence this session owing to the Council of the R.I.B.A. having a large majority of its members pledged to support registration. It is perhaps worth while to review the question and see just where we stand. Registration has been before the profession more or less prominently for many years, even before the birth of our Society; but no definite plan of action was suggested until the Society of Architects made registration the keystone of their policy.

The R.I.B.A. were urged by a small section of their members to pursue a similar policy. This has been done for some time with varying enthusiasm according to the personnel of the Council. In 1903, I think it was, the registrationists formed a strong Committee and nominated for the Council a group of men committed to their policy. They were successful at the election, and in 1905 a Bill was drafted and presented to the members of the Institute. This Bill was, however, rejected.

In 1908 the question was again to the fore, but it was obvious to all that if a Bill was to stand the slightest chance of becoming law the scope of the Bill must be considerably widened. With this object in view another class of members was created—the Licentiate. This was the means of attracting to the ranks of the Institute a large number of architects. The numbers now are: Fellows 859, Associates 1,581, Hon. Associates 56, Licentiates over 2,000. It was also proposed to join forces with the Society of Architects, and a Bill was drawn up for the Society of Architects to be amalgamated with the R.I.B.A. The new Bill was prepared, and in January of this year was presented to the members. There was strong opposition to the amalgamation of the Society of Architects, and an amendment was carried: "Referred back to the Council for further consideration." At the first Council meeting of this session a strong representative Registration Committee was appointed to consider and report on the question. What conclusions this Committee will arrive at it is impossible to say, but I am of opinion that a Bill will be drafted on such lines that it will be acceptable to all classes within the walls of the Institute.

As I have on several occasions spoken against registration I should perhaps state that I am now strongly in favour of registration, and one of my chief reasons for this change of attitude is that I fail to see how we can set up a high degree of education unless we keep before us the advantages of registration. It is impossible to exaggerate the importance of education. We find on every hand, in every walk of life, a higher standard of education is demanded, and it is essential that the architect of the future shall be thoroughly trained in his art, and of a higher educational standing than in the past, if the status of the architect is to be maintained, so that he may take his proper place in the group of learned professions.

I am not convinced that registration will confer any pecuniary benefit on the average architect. Competition will, I imagine, be keener, and for this reason. The boy who enters the profession to-day is, as a rule, one who has a desire to design, to create; he has a strong natural desire to become an architect; but when we have obtained our Act of Parliament, and are a closed profession, is it not probable that many will be attracted who have no aptitude

for the work? This I sincerely hope will not be the case. In conclusion, gentlemen, let me impress upon you that whatever trials and difficulties we may be called upon to face we must at all times remember that we are members of a noble profession, and that no career has greater possibilities for influencing the world in which we live. It is an art that perhaps more than any other marks the character and history of nations. Surely the advancement of such an art is worth living and working for.

After the address the members adjourned for refreshments, kindly provided by the President, and on returning to the Lecture Room a hearty vote of thanks was accorded to Mr. Sutton for his address and hospitality.

A discussion followed on the various points mentioned in the address.

The Nottingham Society celebrate their jubilee on November 12 by a *conversazione*.

INSTITUTION OF MUNICIPAL ENGINEERS.

THE annual general meeting of the above Society was held on October 11 and 12 in London. On the afternoon of the first day four papers were presented for discussion. The first, by Mr. F. W. Platt, dealt with "The Modernising of Building By-laws," and was reported in our issue of October 18. Mr. H. C. H. Shenton (Member) then presented his paper on "The Local Government Report on the Intercepting Trap," a report of which appeared in our last issue.
